THE BUILDING NEWS

AND ENGINEERING JOURNAL.

THE PAST YEAR.

THE year 1880 has not been memorable for the commencement of any important architectural buildings, though it has witnessed the progress and completion of a few, and has given us some ground to expect a return of prosperity in the arts of peace. Our retrospect must be confined to a brief and rapid glance at a few of the more important and typical structures which have either been projected or actually been commenced or finished during the year. Among our great cities which have contributed to architectural progress, Glasgow figured prominently, although not, as yet, to much advantage. The Municipal Buildings Competition, unfortunate though the result has been, has shown the capabilities of the architects of the North, while the streets of Glasgow exhibit, in such works as the Fine Art Galleries, by Mr. John Burnet, and the central station, the outcome of a Classical school in which the spirit of Greek and Renaissance are found united in compositions of a thoroughly grammatical form. Liverpool, also, has shown a rapid progress in her recent architecture, while Manchester, Leeds, Bradford, Ipswich, and many lesser towns have manifested, during the year, considerable activity in the substantial adornment of their streets by the conception and erection of edifices destined to play an important part in the intellectual advancement and culture of their citizens.

We have once more to record the progress made with two buildings of national importance in the metropolis. The Law Courts, during the past year, has been brought to such a state of external completion in its main features, that the public can now form a pretty accurate idea of the completed structure; and we think we are only expressing the consensus of architectural opinion when we say that, apart from the question of style, which will still remain a debatable one, the main frontage towards the Strand, as a vigorous Gothic composition, is unsurpassed in this country for play of outline, light, and shadow. In immediate proximity to this structure, the Temple Bar Memorial has lately been erected, in opposition alike to public remonstrance and good taste, another instance of corporate ambition and officialism, and the pertinacity which substitutes one form of obstruction for another. The completion of Mr. Waterhouse's building at South Kensington, destined to become the principal depository for the Natural History collection which has so long and inadequately found a warehouse in Bloomsbury, is one of the most notable incidents of the year, and as exhibiting a modern phase of eclectic Gothic, carried out boldly in a material of great promise, and combining scientific planning with decidedly effective grouping and colour, the building has special claims upon the architect. Of other buildings in London which have been completed, we may notice the Grand Hotel at Charing Cross, by Messrs. Francis and Saunders, a structure which, for size and internal completeness, surpasses any other similar building in the metropolis, and combines the peculiarities of the Continental and American systems, though, architecturally, its proportions and details are unsatisfactory. In the immediate vicinity, Mr. F. H. Fowler is engaged in the construction of a new theatre in Northumberland Avenue, and Mr. C. J. Phipps has been busy upon several new theatres in London and the provinces. We may mention a new one to be built at Dublin, another in Beaufort-buildings, and the remodelling of the Princess's in Oxford-street. On the Embankment, Messrs. Davis and Emanuel have commenced their new City of London Schools, though on a very different plan and design to that which received the premium. Mr. A. Blomfield has also prepared a bold Gothic design for Sion College Library—two buildings which will fairly represent, when finished, the Renaissance and Late Gothic, as applied to educational buildings. Other buildings are in contemplation here; there is the Grocers' Company's Hall, and De Keyser's Hotel is also in progress of enlargement, so that we may expect, before long, to see the Embankment a representative thoroughfare on a scale hitherto unattempted in London.

The adoption of Renaissance for the style of a new church of the importance of that of the Oratory now in progress at Kensington, from Mr. Gribble's design, is a noticeable feature in the annals of architecture, especially following the great ecclesiastical revival of Mediævalism; the new Synagogue and the Greek Church at Bayswater—the first from the designs of Messrs. Audsley, in a Saracenic style, and the last by Mr. J. O. Scott, in a Byzantine style—are also remarkable departures in style.

Architecture in the metropolis has received many important additions, many of which we have illustrated and recorded during the year. One of the most striking is Messrs. Child's new bank in Fleet-street, the architect being Mr. Gibson. In the City the new Mercers' Hall in Cheapside, from the designs of Mr. J. B. Williams, is a conspicuous structure, showing a florid treatment of Renaissance. The large frontage has been broken up by high roofs, and the architect has freely blended Italian with French and English details, in a manner that passes almost the limits of the extreme flexibility in the style. In Queen Victoria-street the New Post Office and Savings Bank, also by Mr. Williams, has been completed in a much more academic style of Italian, severe astylar, imposing in elevation, and eminently official. We may also notice another official work, the Bow-street Police Court and Station, in another type of Italian equally removed from the two former. Messrs. Ford and Hesketh have been engaged in reconstructing some of the business premises in Cheapside and Fleet-street, notices of which have appeared in our pages. A well-conceived building in what has been called the Neo-Grec style is Messrs. Boulnois and Warner's new offices for the Standard Life Insurance, now finishing in King William-street (lately noticed by us and incorrectly described as the design of Mr. Stanley, the clerk of the works); it shows how well this form of Classic can be adapted for business purposes, while the entresol and decorative details are worthy of attention. Messrs. Joseph and Pearson have been engaged in new premises on Ludgate Hill, for Messrs. Samuel, conceived in a very different spirit. We may mention also the new Telegraph Offices in London-wall, by Mr. Norton, in a rich French Renaissance; and some striking warehouses of the latter class lately erected in the neigbourhood. Mr. Vickery's building in Farringdon-street, lately illustrated by us, deserves notice for bold treatment in a Vernacular style; and in Long-lane Mr. W. Neve has erected a block of offices and warehouses, showing what may be accomplished by adopting Renaissance in brick and stone; we may also mention some warehouses at Pimlico, by Mr. Walford.

In the West-end rebuilding has not been at a stand-still. Mr. Waterhouse, for instance, has given us a practical example of what may be done in terra-cotta in his new corner block of shops and offices between Old Bond-street and Piccadilly, in a freely-

treated style. The New Bond-street Arcade may be cited as a striking commercial undertaking, and several buildings of the same character we have noticed from time to time. The new Vestry-hall at Kensington, by Mr. R. Walker, has been finished, and illustrated by us. St. Mary Abbott's Church has been finished by the addition of a fine spire, from the designs of the late Sir G. G. Scott; and in the Fulham-road the large red brick building erected from the designs of the late T. H. Wyatt, for out-patients in connection with the Hospital for Consumption, deserves mention for its handling, Knightsbridge Barracks, by the same architect, is another conspicuous work of the year, comprising two or three palatial blocks in which Suffolk red brick and stone have been combined in an Italian style. In Bloomsbury also will be found improvements. We have already recorded a memorial infirmary in an Elizabethan style, by Mr. Peacock, and the same architect's parochial schools near Little Russell-street. The new buildings in Theobald's-road have been making considerable progress.

The completion of the new school in connection with University College, by Prof. T. Hayter Lewis, being carried out under Mr. Tavenor Perry, deserves record, and the new wing will shortly be opened. Among other educational buildings of note we may also allude to Mr. Edis's new library, a building for which designs were made a few years ago by Mr. E. C. Lee, in conjunction with Mr. Curzon, Mr. Edis having succeeded the late Mr. E. M. Barry as architect to the Middle Temple. The new library will be in a Late Gothic style and of red brick. Mr. T. Roger Smith's Hospital for Consumption, Hampstead, must be noticed as a pleasing variation from the hackneyed type.

Municipal architecture has made considerable progress. The Glasgow Municipal Buildings Competition stands foremost among the leading contests of the year, though it has not yet resulted in a satisfactory decision. It illustrated the abilities and resources of some of the leading architects in Scotland and England, but the most memorable incident in connection with it is the mismanagement which marked not only the inception of the conditions laid down, but the final award, and which has resulted in general dissatisfaction to the competitors; so that at present a revised competition appears to be the only probable solution of the difficulty. The recent competition for the Pontefract Town-hall, and the Bermondsey Town-hall, may be mentioned here; among other works of the same nature we may name Dunstable, Kingstown, and Maidenhead, towns which have recently shown activity in buildings which may be mentioned in the list of important undertakings of this class. Of works which have assumed practical shape we may allude to the Ipswich Post-office, an ornate building, by Mr. John Johnson, now almost finished; the Corn Exchange, in the same town, just commenced, in an Italian dress, by Mr. Brightwen Binyon; and also the massive red-brick Queen Anne Museum and Fine Arts Club, from Mr. Horace Cheston's designs; the Wakefield Town-hall, a successful building by Mr. Collcutt, Mr. Corson's new offices at Leeds, the Reading Municipal Offices now in course of construction by Mr. Lainson, the Municipal Buildings at Hastings being carried out by Mr. Andrews, the borough surveyor; illustrations of all which we have given; the Eastbourne Town-hall, the competition for which has fallen through, with the result that Mr. Schmidt, the local-surveyor, is deputed to carry out the work.

The Liverpool School of Art competition, which has only recently been decided in the adoption of Mr. Cook's design, is still fresh in the memory of our readers, and seems to have created well-grounded dissatisfaction; we may name also the Birmingham Free Library competition; the Plymouth High School, by Messrs. Paul and Bonella (illustrated by us); the Hereford County Schools, by Mr. F. R. Kempson; the West London School of Art, in progress from Mr. R. W. Edis's design; the competition at Cardiff for a Free Library, and Museum and Schools, resulting in the selection of a design (illustrated by us) by Messrs. James, Seward, and Thomas, of Cardiff; the Bradford Technical School, by Messrs. Hope and Jardine, and the Manchester School of Art, now in progress, from the designs of Mr. F. Redmayne, both which have appeared in our pages; the University College, Bristol, by Mr. Hansom; schools at Hampton, by Messrs. Karslake and Mortimer; School of Art at Turnham-green, by Mr. M. B. Adams. The Hull Asylum competition is another important contest, decided in favour of Messrs. Smith and Brodrick, local architects; the hospital and asylum at Norwich, Lancaster Asylum, by Mr. G. E. Grayson; the proposed hospital at Sittingbourne, Mr. Grant's design; the Bolton Infirmary, the West Devon and Cornwall Hospital, the competition for which resulted in the design of Messrs. Coe and Robinson being selected (p. 220, Vol. XXXVIII.), may be mentioned. Mr. Sedding's unique Hospital of St. Mary at the Cross, Shoreditch; the completion of buildings at St. Peter's, London-docks, as a memorial to the late vicar, by Mr. Bowes A. Paice, must not be overlooked. The baths and washhouses at Manchester and Sheffield, by Mr. J. Johnson; at Salford, by Mr. Jacob; at Rotherhithe, and Richmond, by Messrs. Elkington and Son, are another useful class of building. Exhibitions of an instructive class may be represented by the large Panorama, nearly finished, in Leicester-square, and by another at Westminster, by Mr. Edis.

The Preston Railway Hotel, the competion for which was decided in favour of Mr. T. Mitchell, of Oldham, is in progress. Among competitions which have given general dissatisfaction, the Westminster Vestry-hall is conspicuous, and illustrates in a special manner the need for revision, contemplated by the Institute. The decision, after much squabbling, has been given in favour of Messrs. Lee and Smith's design. We also have to notice a contemplated hospital in Henrietta-street, Covent Garden, about to be erected by Mr. J. M. Brydon, and the completed infirmary at Bolton, by Mr. Knill Freeman.

Ecclesiastical buildings, if not so numerous as they have been, cannot be passed over. St. Mary's, Brighton, by Mr. W. Emerson (see illustrations, Vol. XXXVIII.); the new church at Bedford Park, by Mr. R. Norman Shaw, R.A.; the rebuilding of Hammersmith Church, by Messrs. Seddon and Gough. The churches at Burton-on-Trent, Hunslet, may be named, but the most conspicuous event in the ecclesiastical annals was the princely ceremony of laying the "first stone of the cathedral" at Truro, in May last. As we have published Mr. Pearson's design, it is needless to say more than that all English talent can do to render 19th-century Gothic worthy of an English cathedral, will be done. Spires are being added to the twin western towers and to the chapter-house of Southwell Minster, which is also being re-roofed and internally adapted for cathedral use. The upper stage of Gloucester Cathedral tower has been rebuilt. During the year, also, we have published Mr. J. Brook's fine design for the new Church of St. Mary's, Woolwich, and Mr. J. D. Sedding's interesting structure at Salcombe. We cannot omit to mention the progress made in the restoration of St. Alban's Abbey, and the fact that the new west front has been undertaken by an amateur architect (Sir Edmund Beckett) whose design we recently gave. The consecration of a large church at Leeds, the Hook Memorial, took place in the early part of the year, and may be placed on the list of typical examples of ecclesiastical art; it is by Mr. J. O. Scott, and was illustrated (p. 276) in last vol. There are to be cathedrals at Liverpool, Melbourne, Sydney, Hong Kong. Reference may also be made to St. Peter's, Plymouth, by G. M. Fellows Prynne; to some characteristic edifices by Messrs. Dunn and Hansom, especially their monastery near Canterbury, and to St. Oswald's College, Shropshire, by Messrs. Carpenter and Ingelow. Among competitions recently decided, the Raikes memorial church, Gloucester, must be mentioned, besides the building of a church at Tulse-hill; while in restorations, that of Bangor Cathedral, by Mr. J. O. Scott; the south transept of York, by Mr. Street; Ely Chapel, Holborn, and the world-renowned edifice of St. Mark's, Venice, claim notice. Mr. Street is also finishing the great west steeple, has remodelled the eastern turrets, and is restoring the fabric of the very interesting church of St. Peter's, Mancroft, Norwich. Congregational and other Nonconformist buildings of considerable merit have been completed and made progress during the time, though we can only refer to a few good examples of planning and design that have been given in our pages.

It would be impossible to mention even more important domestic buildings of the year, many of which we have illustrated, though we may remark that the Queen Anne and various vernacular varieties of Old English have supplanted Gothic as a general style for house-building. One of the most recent reconstructions is Mr. C. Barry's rebuilding of mansion at Clumber, near Worksop, the design for which formed a prominent drawing in last year's Royal Academy. Eaton Hall, by Mr. Waterhouse, has been fairly completed, and will rank as one of the most complete of modern ducal residences. The same architect is engaged on Haythrop Hall. Denton Hall, Grantham, by Mr. A. Blomfield, M.A., may also be named as an eminently satisfactory building in Late Gothic, an illustration of which has appeared in our pages.

The obituary of the year is a heavy one, and includes the following names:—Mr. Edward M. Barry, R.A.; Mr. Charles Lees, R.S.A.; Mr. Edward William Cooke, R.A., F.R.S.; Mr. John Parker, antiquary; Mr. Planché, Somerset Herald; Mr. Thomas Landseer, A.R.A.; Mr. Henry O'Neil, A.R.A.; Mr. John Cousen, the landscape engraver; Sir Thomas Bouch, C.E.; Mr. Benjamin Ferrey, F.S.A., Mr. Thos. Hy. Wyatt, F.S.A., Mr. Robert Hesketh, Mr. Wm. Penstone, and Mr. J. H. Hakewill, architects, and Mr. Edmund James Smith, surveyor; the Rev. Mackenzie E. C. Walcott, B.D., the well-known antiquarian and ecclesiologist; Mr. Matthew Allen, one of the introducers of concrete and improved artisans' dwellings; Mr. Josiah Wedgewood, the potter, and the Rev. Henry Moule, inventor of the earth-closet.

WINTER EXHIBITION OF PICTURES AT THE ROYAL ACADEMY.—I.

MANY are the gems, and fewer in proportion than usual are the inferior works, in this year's exhibition at Burlington House. The famous collections from which the paintings have been selected are amongst the very best in this or any other country. We may see upon the walls some of the finest pictures belonging to Lord Bateman, Mrs. Hope of Deepdene, Mr. Charles Butler, and the Earl of Strafford, besides large and first-rate contributions from the galleries of Her Majesty, the Marquis of Aylesbury, Mr. Bischoffsheim, the Hon. R. Baillie Hamilton, Mr. L. Huth, Lord Wimborne, and others. There are not so many

portraits as usual, but some are of extraordinary importance and merit. Of course, the Dutch school is fully represented. There is also an interesting series of the works of the Early Italian and German masters, including some by Raffaelle, Albert Dürer, Lucas Van Leyden, Giotto, Cima de Corneliano, Lucas Cranach, Francia, S. Memmi, and various early school pictures. One great feature of the exhibition is a vast assemblage of the drawings by John Flaxman, beginning with some of his first efforts. The original design for the Shield of Achilles not being procurable, the Academy have exhibited Stothard's drawing of it.

Among the portraits, we have this year several works by artists rarer or less known than what we generally see in the exhibitions. In the first room there is a spirited portrait by Hugh Robinson, representing Thomas Teesdale, of Malton, as a boy flying a kite. The colouring is excellent, but the attitude is somewhat exaggerated. By Francis Coles, R.A., there are two: No. 49, very elaborate in its details, but faulty in drawing, and mannered. No. 142 is far better in every respect; with the same care bestowed upon the intricacies of the ornate dress of the time there is less formality and great elegance. The ladies represented are the daughters of Frederick Prince of Wales. This picture and its companion, No. 133, come from Buckingham Palace. The three daughters of George III., Mary, Sophia, and Amelia, are represented by J. S. Copley, playing in a garden. There is a view of Windsor in the distance. All is done in a solid, praiseworthy style. The colours have stood extremely well. In fact, Copley did not try so many experiments with his materials as some of his contemporaries did, and as most of his successors have done since. Most of the portraits by Gainsborough are by no means representative examples. There is some fine colouring and good sound painting in his characteristic likeness of Wm. Pitt, No. 47, the property of Lord Bathurst. Pitt seems to have been something over thirty when this picture was painted; his features not being so sharply developed as in his later portraits. No. 172, "The Wood-gatherers," is one of Gainsborough's happiest and most beautiful inspirations. A young girl is carrying a pretty child in her arms, who is all life and freshness, while a little boy, holding up some sticks in his lap, is walking by their side, through a richly-wooded and hilly country. "C. J. Fox, addressing the House of Commons during the Ministry of Lord North," shows what the interior of the old House of Commons was like. Fox, dressed in blue coat, yellow waistcoat, and knee-breeches, addressing the chair, is the principal figure; the other members sit round in closer and better order than the house presents in our time. Most of the members sit uncovered, though some exercise the privilege of wearing their hats. It is altogether of value, both historically and for the variety of the costumes, no doubt as true to life as we know that of C. J. Fox himself to be. Nos. 42 and 50 are capital landscapes, the latter as good as possible; 42 is slighter, and less happily coloured. No. 41, "Family Portraits," is a fair specimen of Zoffani's work, interesting chiefly as giving an exact idea of the dress and manners of his time. Those who remember James Ward's portrait of last year will be glad to see one of himself, No. 48, which he painted in 1839, when he was in his 65th year. Of similar interest, but of less power and character, are J. Opie's portraits of himself, his mother, and father. William Hogarth put forth all his power when he painted for Lord Charlemont "Picquet, or Virtue in danger," No. 55. It was done, by request, just about the period that the artist had determined to devote all the rest of his time to engraving. The subject was chosen by Hogarth, and the price too was left to him. He got for it £100, with a pleasant letter expressing the impossibility of putting a money value upon such excellent art. It is worth noticing that it brought at Christie's, in 1874, £1,585. "A young lady" (the portrait is that of Miss Salusbury, afterwards Mrs. Piozzi) having played at cards till she has lost her money, watch, and jewels, is tempted by the young, good-looking officer with whom she has been playing to take them back in return for her honour. She is just wavering at his suit. The subject is treated with great power and less unpleasantness than one sometimes finds in Hogarth's works. Hanging close by them is a fine portrait by Henry Howard, R.A. (56), of Boisgelin de Cucé, Archbishop of Aix, who was a refugee in England at the end of last century. It would well bear comparison with the best of the French portraits of a similar character.

George Morland was never intended for a caricaturist. Pretty as some of them are, and graceful, nothing can be weaker and more mawkishly sentimental than the series of the progress of Letitia from innocence and happiness, through fall, desertion, and disappointment, to repentance. It was painted to engrave. The first of the series only exists in the print, that in the Academy being a copy from the print, made by T. Richmond, where Letitia, in a state of innocence, is at home, in a religious, decent family; in the second she elopes with an officer in uniform; in the next she returns, dressed in fashionable attire, and offers her father some of her present wealth, which, of course, he refuses with just propriety; then in the fourth she is being dressed finer still for a masquerade, while her admiring lover looks on with ravished sight. This is about the best in the set. The masquerade had been the climax; and in No. 5 we find her deserted, standing at a tavern-door, and apparently going on to the town—but that not suiting her, in the same dress (in No. 6) she returns to her home, a fair penitent, and is received by her forgiving parents. Morland could do bits of real country life better. H. C. Ames is the possessor of a capital little landscape, full of truth and vigour: no doubt what he had actually seen in the country. Those who admire power of vigorous expression will find it in the peculiarly repulsive portrait of Jan Steen, his wife, and children. Anything more vulgar, but evidently entirely true to life, it is impossible to conceive. He and his wife had been eating and drinking till they could stuff no more. Sleep has come to her relief; tobacco is solacing him. It is easy to see the sort of home such a man had—but he could draw better scenes. Mrs. Hope's "Christmas Party," No. 100, is a good natural work, entirely free from the utter coarseness of the former. He here faithfully describes a better station of life. Unlike D. Teniers, Jan Steen could paint a large picture as well and as perfectly as a small one. Here we have the interior of a well-furnished house, with guests making merry at a table in the distance, while the mother sits by the baby's cradle talking to the godmother, who is enjoying a glass of good liquor. Two other children, one, the elder of whom, is giving his brother a sly taste out of a flagon with a long spout, are splendidly painted. Nothing could be more masterly than Earl Cowper's "Oil Mill," by David Teniers. There is only a single figure, the master of the mill at his work, and no unnatural heaping up of utensils merely to show how perfectly he could represent them on his panel. We see throughout what this great artist could do with a single touch. This is a much better example of Tenier's technical skill than the larger and more pretentious "Worship of Bacchus." This picture is divided into two subjects: on the left is the actual gathering of the grapes and the process of treading out the juice and storing the wine; on the right is a temple raised to Bacchus, who is seated on a cask, from which flows the amber wine for the supply of a crowd of men who press forward to get it—naturally, some get too much. The value of Tenier's pictures does not always increase in proportion to the size. Mrs. Hope's "Soldiers Playing Backgammon" could hardly be surpassed. Its condition, as in fact is the case with most of her pictures, is unusually perfect. Many, we believe, have remained in the family from the time they were executed, and so have escaped the frequent cleanings and repairs which are undergone by those which have often passed through the hands of dealers. The companion picture, No. 66, though on copper, is as fresh as when it left the painter's easel. "Corps de Garde," belonging to the Hon. R. B. Hamilton, is a study of armour and other military accoutrements heaped together, the figures of the guards playing in the background being merely auxiliary. Frank Hals is always good, as is shown in the only picture by him, No. 59, "The Merry Comrade"; Mr. Bischoffsheim is its fortunate owner. We have seldom seen so grand and scholarly a picture as the "Landscape with Horsemen, &c.," by P. Wouvermans, painted in 1653. It is a splendid composition. In the foreground, there is a village by a river-bank, *en fête*, with groups of people merrymaking, dancing, drinking, and fighting, men and boys jumping into the water off a barge, and no conventional white horse. Miles away, the eye passes over a grand landscape to the hills beyond, the plain being dotted with buildings and towers. The atmospheric effect is marvellous. The canvas measures 27in. by 43½in. This is by far the best picture by Wouverman in the collection. Mrs. Hope however, has a very charming one, smaller, and more in his ordinary manner. The subject is a village merrymaking—the merriment being in certain cases not altogether wise. One of the prettiest features is the accurate and beautiful drawing of the birds, which are flying about or feeding in front of the public-houses. It is strange that so elegant a painter should condescend to such coarseness as disfigures a small part of this graceful picture. Gabriel Metzu may be seen in the three examples, all belonging to Mrs. Hope, in greater perfection, we fully believe, than in any other collection. Perhaps the most wonderful is No. 127, a gentleman in black dress, writing. It is admirable for the harmony and contrast of colour, the clever management of light and shade, and faultless drawing. There is more movement and life in No. 125, in which a servant is drawing a green curtain over a sea-piece in grisaille, which is hanging on the wall, while her mistress is reading a letter she has just received. No. 130 is also an interior of a room, in which a lady is seated at a table writing a letter, while a gentleman, apparently unseen and in no too amiable a mood, is looking to see what she writes. There is a good deal of character in the faces. There are some pretty, but not important, sea-pieces by Wm. Vandevelde.

THE GROSVENOR GALLERY.

THE Winter Exhibition at this gallery opens with a superb collection of decorative designs, in which the rising school of younger painters is largely represented. To the decorative artist and architect the value of this feature in the present exhibition is very important, and we direct special attention to it. These works fill the vestibule and east gallery, the leading artists

being Mr. E. Burne-Jones, who alone exhibits no less than nineteen drawings and cartoons; Mr. Walter Crane, Mr. H. Holiday, Mr. L. Alma-Tadema, R.A. Mr. W. B. Richmond, Mr. E. J. Poynter, R.A., and Mr. W. J. Muckley. It is as a newly-developed taste and as the beginning of a new school of decorative design, that we desire more particularly to call attention to these works, and not because we think they are destined to have a lasting influence upon art. As illustrations of what the high-art school deems to be the ideal of decoration, Mr. Burne-Jones's collection may be taken as the best examples we have. To mention these, we may first notice two pencil cartoons entitled "Design from Romance of the Rose," a subject taken evidently from the poetical allegory of the 13th century under that title. Of the first drawing we cannot say much for the composition, and the lower limb of the left-hand figure is evidently faulty in drawing about the knee. Taking it, however, as a work by a consummate and daring artist, whose aim is to transcend the received canons of art as handed down by Raphael and his followers, we must acknowledge the design is powerful and poetic, notwithstanding the perverse ideas it exhibits; the companion picture is both more correct as a drawing, but there is nothing in it the most academical critic could find fault with, and the pencilling is freer and the drapery more graceful and flowing. In both drawings Mr. Burne-Jones introduces that particular type of angelic countenance which mark all his works. "A Sea Nymph" (326) is a conventionalised nymph rising out of a rough sea of deep bluish tint. We could hardly have thought Mr. Burne-Jones would have painted so thoroughly hackneyed and crude a type of decoration. The companion picture in oil, "A Wood Nymph," is far more original: it represents a lovely face and half-concealed figure, with streaming hair, intertwined with the branches of a tree, and is in every way more in keeping with the artist's poetic imagination. In another subject, "Cupid's Hunting Ground," we have an example of decorative treatment in *gesso*, a species of modelling or bas relief that we have had occasion to refer to before in these pages; Mr. Burne-Jones has here produced a panel in which cupid and wood-nymphs are represented in colour, and with all the metallic lustre of bronze and gold; we might almost mistake the work for a low-relief bronze; but it would be extremely uncomplimentary to liken it to embossed leather-work. But we turn from this group of the work of the artist to another which occupies the end of the gallery. Chief and central among this is "Dies Domini," a circular picture in a decorative key of colour, representing Christ seated in clouds of azure, amid ranks of angelic beings, whose faces are of seraphic expression and beauty. The colouring, intensely bright ultramarine, the clouds of winged angels, and the treatment of the drapery, place this work in an essentially decorative class, and a devotional feeling of the highest order pervades the composition. As a scholarly and a refined abstraction in colour, a subtle conception of a religious subject, a long way removed from the ordinary conventions of the artist, this picture or panel holds a high place. The design from the "Song of Solomon" (339) is a large decorative cartoon in outline, in blue, green, and brown; though very rich in composition and accessories, offends one's sense of grace by the stiff and straight figure which, in mid air, is thrust across the picture. The whirls of hair or drapery, unique in Mr. Burne-Jones's works, are introduced with a weird-like and cunning power, and the whole bespeaks a poetic sentiment. "Elijah" is a life-size study of the prophet, massively painted in a style which is certainly not marked by any of the later manifestations of the painter's work, but not on that account less successful; indeed, it may be thought to be the most sober of the many figures; there is a grandeur in the conception of the attitude and drapery. We next come to a design for "Part of a Window" for Brampton, a more recent performance. It is shown in three full-size compartments, and is executed in coloured crayon; but the most remarkable of the works of the artist are those numbered 353, 356, designs for glass windows. "The Judgment," designed for East Hampstead Church, is a grand composition in colour and crayon, executed as full-size cartoons in three compartments. In the colouring a low key is chosen, exquisitely harmonious and decorative. Of the design it would be difficult to speak with the same admiration. Of course, in estimating this and the other compositions of the artist, the observer must bring his mind and imagination into a fitting vein; he must cast aside all preconceived notions of the works of the great Italian masters of the Renaissance school, to whom he has always looked for models, and must try to realise somewhat of the subtle sentiment and poetic mysticism which mark the conceptions of that intense religious and pre-Raphaelistic school of which the author and Mr. Gabriel Rossetti are the leaders. When in this frame of thought, the "Judgment" and "Paradise," "Two Groups of Angels," the latter a design for a window in Salisbury Cathedral, may be fairly appreciated. No one can deny the subtlety and delicacy, the poetic symbolism, and the depth of reverential feeling which pervade these compositions; the figures are essentially the same in attitude and expression with those we had in the same artist's "Annunciation" and the "Golden Stairs," of previous years; the faces are all of the type as in every other of the subjects exhibited—a love-lorn, saddened countenance, with deep-set eyes, and broad intellectual foreheads; the draperies full of small stiff folds. The "Two Groups of Angels" are heavy in the drapery of the figures. Four smaller designs are shown for subjects for the predella of a window.

We may now cast a glance at a few other decorative works, remarking that they exhibit a great divergence in style and sentiment. In the vestibule, Mr. J. E. Millais's "Design for the Tracery of a Window" (319), is an unfortunate instance of a celebrated painter attempting to give us his notions of architectural design. That it possesses originality is all that we can say in its praise. The conception of the artist consists in introducing the figures of angels into the curved lines of the tracery. Thus the two lower lights have pointed arches formed by angels meeting together, face to face, at the apex of each, and their bodies or wings forming the sides of the arches, clasping hands a little below, while the quatrefoil filling in the head of the window is similarly formed, the upper cusps being indicated by the hands and arms of the embracing figures. Although a full-size cartoon, the conceit is not clearly worked out, the modelling, light and shade, especially in the wings, being imperfectly shown. Mr. Walter Crane exhibits several designs; the least meritorious, in our opinion, is the "Design fer a Chimney-piece" (322), where an exceedingly heavy composition rests upon pilasters of bad proportion, to say nothing of the weak bases and detail. "The Sleeping Beauty" (332), a cartoon for a wall-paper, is pretty in design and drawing; in the tendrils and apple-blossoms the Sleeping Beauty is introduced, and the colouring is happy. Above is a large cartoon, "The Fates," for needlework, displaying some clever figures. The cartoons for nursery wall-paper, and the designs for encaustic tiles (302-304), representing, outline, emblematic figures of the hours of the day, four seasons, and nursery-rhymes, are cunning in scheme in a low scale of colour; but the most striking designs by this artist are "The Goose Girl" for tapestry, and the "Design for Frieze" (336-337); the first, a large composition of quaint design in water-colour, and the second a crayon study of three female figures in pale tints of green and red, resembling the "Graces," are enveloped in flowing drapery, and display considerable grace in the outline and grouping. "Earth, Air, Fire, and Water" is also an emblematic composition, with animals introduced in the branches of a central stem, but it lacks repose. Mr. J. H. Pollen shows a too naturalesque treatment for a painted ceiling; while Mr. L. Alma-Tadema, R.A., in his spirited and highly-finished monochrome tempera studies, "Mars and Venus," and "Bacchus and Silenus" (330, 331), are scholarly productions on a grey paper, evincing much decorative and poetic value and suggestiveness. Also chaste and classical in sentiment is Mr. H. Holiday's "Design for a Frieze in Clifton Cathedral," in crayon; the light red dado sets off the figures of Apollo and the Muses. Mr. W. J. Muckley's decorative panels, and Mr. E. J. Poynter's design for Mosaic in the House of Lords, the latter St. George with allegorical figures of Fortitude and Purity, are also conceived in the typical academical spirit, and are noticeable as examples of a very different class of decorative work to that we first alluded to.

We must now very briefly notice a few of the more important water-colour pictures in the large gallery. As usual, Sir Coutts Lindsay has brought together a number of the works of French artists, remarkable for vivacity of style, colour, and sparkle. We may mention "Sur la Terasse," a lady in low dress reading in her garden or terrace, by G. Van den Bos; a clever sketch of tramping sportsmen in the rain, by H. Harpignies; "Rotten Row," by E. Hoetericks; "Barques pres de Rouen," by C. Lapostolet; "Au Pont Royal," by N. Goeneutte, a brilliant sketch, No. 11, and the exceedingly sparkling and vigorous flower pieces, No. 16; "Marche aux Fleurs à Nice," by H. L. Scott and N. Goeneutte; No. 17, noticeable for the energetic drawing of the figures. The picture called "Abraham" (22), by J. Cazin, is handled in a broad style, vigorous in touch; but the treatment of the Patriarch's trial is rendered rather ludicrous by the angel who is rushing down hill to arrest the sacrifice of Isaac. A fine bit of colour, evincing much feeling, is "Gros Temps" (25), by U. Buten, and the brilliant sketches by A. Edelfelt; G. Haquette (31), a clever figure-study, wonderfully true to life, and the pieces by P. M. Beyle (33), L. Gaucherel (34), and the clever pictorial idea No. 36. The collection will repay study, as illustrating the very different sentiment and handling of the French to our own artists, and among the collection not the least noteworthy are the truthful drawings by E. Viollet-le-Duc, one "Sommet du Glacier de Scherzemberg," and another "La Montée au Chapeau." The gallery contains also several contributions from the Liverpool Society of Painters in Water-colours, numbered from 39 to 66. One of these, "Un Coin de Cuisine," is a highly-finished study from still-life, by Mrs. Pauline Walker; "The Edge of the Moor," by F. W. Hayes, is a conscientious rendering of a rocky-foreground and spring, and in a very different manner, and decidedly pre-Raphaelesque is Mr. J. M. Southern's "Reedy Pool by the River." The school of naturalists is well represented in such works as W. Pilsbury's "The Waggon" (51), a quiet pastoral scene of a farmhouse admirably drawn and grouped, highly

finished and skilful in the subtler charms of colour and shadow; and in J. Knight's "Hay Time," a fine broad meadow, illumined by a gleam of sunshine. "The Mill at Rest," by J. W. Walker (55), is a fine bit of execution; and C. Potter's "Drenched," a herd of sheep being driven over an open moor in a drenching rain, is full of freshness, exhibiting a keen sense of colour and atmosphere, and one of the best works of its kind on the wall. For rich landscape effects, A. Hartland's "Near Barmouth" justifies the position it occupies; the flat and upland are very truthfully rendered in both drawing and colour, and we must also remark T. Huson's broadly-handled landscape, transparent in colour, "A South Country Common," such as we may see in Wiltshire or Hampshire; and Walter Severn's "Windy Day" (67). W. Laing has depicted a poetic incident from the Greek in No. 61; the reposing figure is well drawn, and the accessories and colouring in quiet harmony. "A Dutch Vrow," by J. S. Morland, is a truthful study of life; and R. Beavis's "Study at St. Just, Oise" (71) must be noted as a spirited sepia sketch of agricultural life; so also the same painter's view of Portsmouth (75) is forcible and truthful. For exquisite finish and delicate handling the solidly-painted studies of "Water Lilies" and "Christmas Roses," by W. J. Muckley, cannot be surpassed. Domestic incident is quietly told by E. G. Kilburne in "Home Again," where a young naval officer or cadet is seated near his affianced at an *al fresco* tea-party. The verandah and distance are depicted with much truth. We cannot admire the "English Landscape," by J. W. North; the church and distance are feeble in drawing; but we must bestow well-merited praise upon W. E. Lockhart's fine view of "Durham," which occupies the place of honour. The stately position of the cathedral as it rises from the river and misty city enveloped in smoke, has been skilfully depicted by the artist, who has brought the resources of his pencil and technical handling to the task; nothing can be more truthful than the manner in which the cathedral and rising background emerges out of the mist and smoke which hover in the valley and over the tile-roofs of the city. Near this P. R. Morris, A.R.A., contributes two pieces "The Parting" and the "Bridal Morn," (115 and 116). There is a poetic sentiment in the sailor and his bride by the seaside, and the subjects sustain this artist's power as a delineator of sentimental incident. We can only scan the lovely flower-pieces by Mrs. Naftel (119), and J. D. Linton's (124); E. M. Wimperis's clever sketch "Wet Sands" (121); J. S. Hill's broadly coloured "Meadow" (123); W. B. Gardner's woodland piece (126); G. Clausen's "Sunday Morning." In massive handling Jules Lessore gives us a fine and vigorous sketch in light and shade of the "Entrance of Ducal Palace, Venice" (128); while the cattle, farmyard, and atmosphere in A. F. Grace's "Incense Breathing Morn" is something more than a natural transcript. As a genuine water-colour sketch, Clem Lambert's "View of Winchelsea" (131), possesses a merit which few of the modern school of water-colour can boast in their work—a freedom from the artifices now so much in vogue.

A few architectural drawings are exhibited which we must not pass over. "Old Houses on the River, Norwich," is a capital subject, but Mr. Barwell's drawing is hard in colour. Newton Benett gives us a peep of a picturesque bit, Audsley House, Salisbury, brightly coloured and highly-finished; but the work of the season in this room is Carl Haag's fine drawing, No. 154, showing a caravan of Bedouin near the Sphinx of Ghizeh during a sandstorm, remarkable for power of drawing, the fine colouring and technical qualities displayed in the sand-laden clouds. Lennard Lewis has a picturesque sketch of Rue de l'Horloge, Dinan, Brittany; Walter Crane, a well-executed drawing of the Elizabethan Gateway to Blickling Hall (164); R. R. Holmes, a drawing of the "Gates of St. Mark" (195); while in the small water-colour gallery, J. O'Connor's "Studies in the Tower" (197) and his "Sketches in Berne" (267) make a series of very pleasing fragments of old architecture faithful in drawing and neatly finished. One of the best architectural sketches is R. P. Spiers's House of Jacques Cœur, Bourges, executed in sepia and grey. We must also mention A. F. Payne's drawing of the Crosby Tomb in Great Helen's Church (263), J. Fulleylove's pleasing views of Baptistery and Piazza del Campo, Siena; A. Severn's "Amiens Cathedral" (231), and J. Pedder's "Durham."

We can only mention the names and numbers of a few other productions: by C. J. Lewis (134), E. F. Brewtnell (140), J. Syer (122), E. J. Poynter, R. A. (101), Guido Bach (157), Miss Phillott (150), G. G. Kilburne (158), A. C. H. Luxmore (159), Fairfax Murray (165), A. Parsons (169), Mrs. Carr Hastings (174), Walter Severn (178), Lady Lindsay (179, 180), C. Whymper, Miss Kate Greenaway (224), J. A. Smith (234), J. Orrock (238), G. Lucas (243), J. Aumonier (253), G. W. Cook (255), Miss Chase (266). In the sculpture gallery a few—A. Fussell (273), R. Spencer Stanhope (286), J. C. Robinson (275), and in the vestibule E. E. Morland's French Studies (287, 288), a charming stretch of deep blue sea and sandy beach, by Galafre (293), and some flowers by R. Revoire. H. Holiday shows also two clever decorative studies for reredos and window in Nos. 311 and 312.

THE STUDY OF THE BEAUTIFUL.*

"DIFFICULT are the Beautiful." In Plato's Dialogue, called "The Hippias Major," Socrates says to Hippias, "A certain person has very lately (during some conversation) thrown me into a difficulty. I was finding fault with some things as being ugly, and praising others as being beautiful, when he asked me in a very saucy manner, 'From whence do you, Socrates, know what things are beautiful and what ugly? Come, then, tell me in a word, What is the Beautiful?' and I through my want of wit was at a loss, and had it not in my power to answer him with propriety." Hippias seems to think that there is nothing easier than to answer the question, but Socrates baffles him at every point, and in the end winds up by quoting the ancient proverb, "Difficult are the Beautiful." Hogarth, in his "Analysis of Beauty," says: "Though beauty is seen and confessed by all, yet from the many fruitless attempts to account for the cause of its being so, inquiries on this head have almost been given up, and the subject generally thought to be a matter of too high and delicate a nature to admit of any true or intelligible discussion." Having read these passages over two or three times, I began painfully to realize the responsibility I had undertaken in venturing to give a lecture on the Study of the Beautiful; when it struck me that, although the Greek philosopher could not, or pretended that he could not, answer the question, What is the Beautiful? yet the Greek sculptor, and even the humble potter, could show it to us; and, therefore, may I be allowed to suppose that Art is the real language of the Beautiful, and that in which it can best express itself; since it is a universal language, and one whose syllables and phrases are the very forms of beauty, and not doubtful words and difficult logic, that a very small portion of the human race is capable of understanding. And besides which, it always seems to me that the philosopher shuts his eyes to look within himself for the Beautiful and for truth. But the artist must open his eyes very wide, and his mind's eye also, and look all around him everywhere in search of it, and then tell us as much as he can about it in his own visible language. Nor is there that antagonism in real art that there is in speculative philosophy. All great art, of whatsoever time, is alike in spirit, and even, as we shall see, in form, for it is founded on the study of nature. And although we no longer consult the Delphic oracle, nor worship in the temples of the gods, we still admire the Apollo Belvidere, the Venus of Milo and of Medicis, and all fine Greek and Greco-Roman sculpture. Many of the ancient creeds and dogmas have passed away, but the art which was employed to illustrate those creeds, where it has survived the destroying hand of man, and wherever it was founded on the study of nature, still remains, and is still loved and admired. No beautiful art can exist unless it is founded on the study of nature, nor can we even appreciate it unless we know something of her laws, for these are the foundation of all the laws of real art, and must be studied in order to acquire an appreciation of the Beautiful in art. And it is especially this appreciation and knowledge of art that I wish to call attention to, for, without it, art would indeed be solitary and of little use, and without much chance of progress, if her secrets and her beauties were only known to be to the few; they should be known to everybody as far as possible. Not that everybody should practise the art, that is neither necessary nor possible; but if the public generally know nothing of its principles or elements, and are obliged to be told by a friend, or to look into the newspapers, to know what to admire, then art has no mission. And it is like having picture exhibitions for the blind, and concerts for the stone deaf; nor is it difficult to see how disadvantageous this state of things must be to the art itself. If an artist who has to earn his bread like any other worker, finds that the art he may put into his picture is not likely to be appreciated, then he will be tempted to neglect that very thing which alone gives real value to his productions, and think only of how to catch the eye and tickle the fancy of the wealthy purchaser, and thus the art gradually degenerates until finally it is lost altogether. Possibly we might trace the causes of the rise, the progress, and the decline of art at different periods of its history to this external influence, and if so, then I trust I am not indulging in a vain hope or a mocking dream, when I say that it seems to me that there is a great and increasing desire in the public mind at the present time for beautiful things, be it in painting, sculpture, architecture, or in the manufacture of the common articles of daily use, and that therefore we may look forward to a great and increasing supply of beautiful art in all its various branches.

By the Study of the Beautiful, I understand the seeking for the beauty and goodness of things as opposed to looking for their faults and their badness. For one who can perceive and appreciate the beauties of a fine work of art you have a thousand who can find some fault with it. For one who seeks out and studies the kindness, and goodness, and beauty of humanity, you have a thousand who can talk only of its wickedness. Now although there may be some sense of justice in this, I take it rather as a sign of an absence of the capacity to perceive beauty. No doubt it is right to expose the faults—to be unduly lenient towards them is erring in the other extreme, but it is wicked and unjust to conceal and wilfully to ignore the beauty and the goodness. Which of the two is the most wholesome food for the mind, goodness or badness? Which is the most productive and beneficial? A great artist or a great poet stores his mind with every beautiful object that he sees in nature and in art, with all the good deeds and kind thoughts that he believes his fellow men are capable of, and then makes it his study to show them to the best advantage to the world. Surely the minds of such men must be full of joy; for the reflections of their minds in their works, produce those pictures and those poems which are the delight of ages. Not for a moment do I mean to say that beauty is all sweetness; it has its terrible aspects as well as its joyous ones. Ophelia is beautiful in her sorrow, beautiful in her madness, and beautiful in her death. And as in music there are certain discords which conduce towards the harmony of a piece, so in art there must be some ugliness, some dark shades and rigid lines to enhance the value of its grace and beauty,—as the dreary days give value to the joyful ones, the storm in its rage makes the calm seem all the more peaceful; as the darkness

* A paper read by GEORGE ADOLPHUS STOREY, A.R.A., at the London Institution, Finsbury-circus, Dec. 30th 1880.

of night makes us rejoice in the return of morning. Note how often the most tragic subjects have formed the most beautiful themes for art and for poetry. It would seem that the very grief of humanity was that which wrung from the poets and the painters some of their most beautiful conceptions, and this, perhaps, is because, only under the great and severe trials of adversity does the whole strength and beauty of the human character make itself manifest—all its energies are roused, and the passions are excited to the uttermost. Then it is that we see one of the elements of human nature most flattering to our hearts—and that is self-sacrifice. The brave soldier leading on the forlorn hope with almost certain death before him; the captain of his sinking ship the last to leave her; the lifeboat manned with volunteers risking their own lives to save a shipwrecked crew. Let us consider that our minds are like bookshelves, on which we can only stow away a certain number of ideas. Now shall those shelves be occupied with the marvels of nature, with pleasant and true wisdom, with mirth and laughter and innocence, or shall we ile them up with the records of men's villany, he scandal of society, and the morbid reflections f the pessimist? In other words, shall we occupy ourselves with the study of the beautiful, or the study of the un-beautiful? Of course we must take heed of both, for one is the light and the other the shade; we must study both, and then confess that the light is the most beautiful.

Now it is very natural that the first question which will arise in your minds, is this: in what does the beauty and goodness of things consist, and in what their badness? The subject has already been so magnificently treated by a great living author, Mr. Ruskin, that I feel little, if anything, can be added to what he has most beautifully said, and I have not any doubt that his works have conduced to a very great extent towards that desire for beautiful things, and that improvement in taste which we have noticed as characterising the present time. It is well to have something to think about, besides the routine of business and the every-day affairs of life, and in this question, "What is the Beautiful?" although we may never be able to answer it quite satisfactorily, any more than the alchymist could discover the philosopher's stone, still it is one that will always give delightful and profitable occupation to the mind, and perhaps help towards the solving of other difficult problems and vexed questions. The alchymist in his endeavours to find a means of turning every metal into gold, although he did not succeed in that, discovered instead, and advanced, the most valuable science of chemistry. And so also with the study of the Beautiful, although man in his efforts to attain to that perfection which is unattainable, and therefore he can never be said to have discovered the quite Beautiful. Still he has discovered in the same way that the alchymist did the noble arts of architecture, sculpture, painting, poetry and music, and we may take all these fair sisters as forming a group of very great loveliness, imperfect only because it is the work of man. If the alchymist had discovered a means of turning every metal into gold, then he would in reality only have discovered how to make gold itself actually worthless. And perhaps if we were to discover some one thing that was admitted by all, and scientifically and undeniably proved to be the one and only thing of Beauty, then our efforts to do more must cease. The architect must lay down his compasses and his rule; the sculptor his chisel and his mallet; the painter his colours and his brushes; the poet his lyre, and the musician his scales, and his chords, and his harmony. So perhaps it is better for us still to be as we are; for us still to be endeavouring to find out more of the Beautiful, and to continue its study, which is an ever going forwards—and of ever-increasing interest.

We have in the present instance, chiefly to consider Beauty, as shown in the art of painting. We have to consider the drawing, the composition, the subject, the expression, and the execution of a picture. Beautiful drawing consists in exactly expressing the form and the nature of the object to be drawn. If it is a leaf or a flower, the drawing should be light and delicate. If a branch or bough of a tree, it should be firm, and free, and springy; if of rocks, it will be decided, perhaps hard; if of the human form, it should be firm yet flexible; if of drapery, it must possess a freedom, a loose quality, according to the nature of the material of which the drapery is composed; if of the face and expression, then the utmost delicacy and refinement is necessary. So we see in the first place, how a good draughtsman suits the handling of his pencil, or his brush (for painting is only drawing with a brush full of colour) to the nature of the object he is drawing; and hence we perceive that beautiful drawing is not a mechanical process, but a mental one. Bad drawing is merely mechanical; a bad draughtsman takes no pains to distinguish the character of one thing from another; there is no expression in his work, it is clumsy, without thought, and of little value. But in nature's drawing there is a meaning in every variation of her outlines—she seems to have to think about it a good deal—if she is drawing a bough of a tree, she makes it start away from the stem, with a bold curve outwards, and generally upwards expressive of the strength that will be required to bear its burden of leaves and fruit, &c.; and then perhaps, it has to fight its way through other boughs and branches, and a sort of struggle for existence goes on, and yet in very good fellowship, the different boughs turn aside, and aside again, to accommodate themselves to each other in a polite way, as if they were saying, "After you sir," and so, by many gentle curves, and delicate turns, and a running straight forward when they can get a chance, their whole idea and intention being to get as much light, and air, and moisture as possible. And thus nature, from the very necessity of the thing, from its very fitness or adaptability to its purpose, founds her art of beautiful drawing. Mr. Ruskin tells us that "Graceful curvature is distinguished from ungraceful by two characters: first, its moderation—that is to say, its close approach to straightness in some part of its course—and secondly, by its never remaining equal in degree at different parts of its course." He further tells us—"that this variation is twofold in all good curves: there is first a steady change throughout the whole line from less to more curvature or more to less, so that no part of the line is a segment of a circle, or can be drawn by compasses in any way whatever." Thus one example is a bad curve, because part of a circle, and is, therefore, monotonous throughout; another is a good curve, because it continually changes its direction as it proceeds. Now, in this Greek vase, we have an instance of how ingeniously man can adapt, and mould the great truths of nature to the purposes of art, and here we have an epitome of good drawing. If we carefully study all the most beautiful forms of nature, or let us for the moment call them the most pleasing; we shall find that their outlines, though varied and distinct, have certain qualities which are universal; there is an emphasis more or less great in all beautiful curves, sometimes it is again but faintly echoed, but these characteristics are invariable throughout nature in all her important works, and here in this Greek vase you have them distinctly idealised; here you have the classical rendering of the characteristic of nature's outlines, and therefore I call it a beautiful thing. But nature is not content with drawing one beautiful line, she must draw another also beautiful in itself, which shall, by its contrast, show off the beauty of the other one, and herein lies the great prevailing law of the Beautiful in art, that each part of a work is designed so as to advantage the rest, and it would be well if this could be carried out in life; at all events, this is the great doctrine of true art. The straight line and the circle enter largely into the composition of beautiful designs, although it is said that they are not beautiful in themselves on account of their monotony. But the straight line steadies every composition of other lines, and gives value to beautiful curves, for it shows off their grace by contrast, and the circle is an exact foil to straightness, and when judiciously introduced, as in architecture, gives in its turn great value to the straight lines and square forms of a building. The fret patterns, which are favourite Greek ornaments (here they are on this vase), show us the beauty of straight lines. Straight lines vary only in length, and this key pattern gives us that variety in a beautifully proportioned figure. It pleases us on account of its unity, and its variety (two of the great laws of the Beautiful) and because it brings out the one quality of infinity which straight lines possess; namely, variation in length, and note that the frets are not square but oblong, and therefore capable of a greater degree of variety; and this again is broken at intervals by a square and a different pattern sometimes containing a circle showing the value of contrast, which is another of the great laws of composition; and note that being on a round surface each fret appears to decrease in length as we follow it round the vase, which again increases its beauty by gradation. If we study the celebrated Campanile at Florence by Giotto, we shall see how exquisitely beautiful a design composed of straight lines may be made by an artist of taste. There is much more to be said about drawing and composition, and about the laws of principality subordination, repetition; the law of curvature, as used as a leading line to guide the eye through the picture, or as a bounding line in the placing of the objects; the law of radiation or springing from one root of contrast, &c., for which we have no time now, but which cannot be better explained than they are in Mr. Ruskin's Elements of Drawing, a most useful but I am sorry to say a very scarce book.

(To be continued.)

VENTILATION AT THE CUSTOM-HOUSE.

AN important application of the principle of ventilation introduced by Robert Boyle and Son, of Glasgow and London, has been recently made in the "Long room" of the Custom House, in Thames-street, and a series of experiments to test the efficiency of the system are being made, the results of which, as far as we have tested them, are very satisfactory. The new ventilators have been fixed under the direction of H.M. Office of Works in the above-mentioned room, an apartment measuring about 200ft. long by 64ft. wide, and 54ft. in height. From the experience of those engaged in the long-room, numbering between 400 to 600, the atmosphere before the new system was applied was insufferably oppressive and warm, and we hear from two or three of the clerks themselves that they often suffered from headache in consequence. The only outlet for the heated air provided were the windows at the extreme ends of the room, below the ceiling, and the windows in front, aided by the opening of the doors, and the only inlet a large iron grating in the floor, which admitted the foul air of a room below. The room is divided into twelve bays by pilasters, each having a large window facing the river. Under these windows, in the recesses formed between the pilasters, now used as cupboards for the clerks, inlet-openings have been made, leading into wooden air-trunks about 12in. square, which at the ends are carried up as vertical tubes, as in the Tobin system. These are left open above the heads, and are covered with perforated zinc plates. There will thus be 12 pairs of these openings on one side of the room, giving a large admission of fresh air from the most desirable side. Along the ceiling, at the crown, a wide single span vault, constructed of iron ribs and plates of an elliptical form, six circular openings have been made for tubes 18in. diameter, which pass through the roof, and are provided with six of Messrs. Boyle's air-pump ventilators, which act as exhaust shafts. Examining these in the roof, we found a decided up-current in each, although the galvanised iron-tubes were of the large area of 18in. diameter. These tubes are not carried straight through the ridge, but have a bend, the ventilator being fixed a little on the leeward side. Facts are worth more than theories, and it is one of the best recommendations of the system we have mentioned supported by those engaged in the room, that, since the introduction, the room has become more pleasant to work in, and the feeling of oppression has not been experienced. Architects interested in the subject, and there are few that are not, cannot do better than test for themselves the action of the system, as applied to one of the largest public rooms in London.

DETAILED DRAWINGS OF PIPE SEWERS AND MANHOLES FOR STEEP GRADIENTS.

WE have received a copy of a supplemental sheet, published under the direction of Mr. Robert Rawlinson, C.B., chief engineering inspector to the Local Government Board, containing typical plans and sections of manholes on pipe sewers having steep gradients, for the use and information of engineers and others having to deal with the drainage of towns under

those conditions. The sheet now before us details a variety of applications; the principal point however illustrated is, that the incoming sewer is placed its full diameter above the outgoing sewer from the manhole, the object of this arrangement being the prevention of "back-watering" of the branch sewers until the main sewers are running full, a frequent cause of stoppage of house-drains and deposit. In other respects the manholes are precisely the same as those illustrated in sheet 1, in the former instructions issued by the Local Government Board, though the manhole covers are shown circular, having wood bedding plates and blocks to prevent jarring. Six different forms are illustrated in the sheet "No. 1A," which we may briefly describe for the sake of those who may not yet have obtained this sheet. Distinguishing the sections, we refer to the figures. Fig. A shows plans and sections of a manhole at the junction of two sewers entering into a pipe-sewer at right angles. There is a sluice-plate shown that can be raised or lowered by a chain from the top. The sluice is 21in., and an overflow is provided over the top of plate to prevent the filling of the manhole; by these arrangements the flow of sewage-water can be stopped back and be let off suddenly to flush the sewer. The brickwork of the manhole at the bottom and round the pipes is surrounded by about 6in. of concrete, and the top of manhole is reduced for the cover by sailing-over the brickwork on three sides. Fig. B shows a similar arrangement of manhole, with an 18in. sluice at a single pipe-sewer junction, the outgoing sewer or outlet, as in the first case, being placed so that its crown is about level with the invert of inlet. Fig. C is adapted for a manhole with 15in. sluice, and Fig. D for a 12in. sluice. The next illustration, Fig. E, shows plans and sections of a manhole with an overflow, for the purpose of relieving sewer from storm-water; in this case the relief-pipe is shown nearly 9ft. above invert of sewer; but its position must, of course, be determined by the house connections. Another detail shows a simple pipe ventilator fixed to upper side of sewer, and passing through concrete to a small brick chamber having a ventilating grating, in all essential respects agreeing with the former suggestion. An additional section is given of an arrangement for ventilating sewers laid in steep gradients. The inlet sewer of 1ft. 6in. diameter, discharges into a vertical cast-iron pipe 9in. diameter, which passes down on the outside of manhole, inclosed in concrete, entering at the bottom of it with a kind of siphon bend into the outgoing sewer. Opposite the incoming-pipe is a storm overflow, with flap introduced into the manhole. By this simple arrangement, the effluvium often arising from manholes where sewers enter them at different levels, is to a large extent cut off from the manhole, as the vertical pipe forms an independent connection with the outgoing part of sewer, and the valve of storm overflow is only opened when a great volume of storm-water is passing through the sewers.

Those who have not obtained these sheets of detailed drawings, will do well to get them; they are all to a good working scale, ½in. to the foot, and with the supplementary sheet just issued may be regarded as a complete exposition of the approved system of sewering. A few years ago surveyors of local boards and corporations were placed at a great disadvantage in the preparation of the plans they were required to submit to the Local Government Board, when loans were asked for; there were no authorised data to consult, and engineers were obliged to adopt the opinions of various authors. Now all the information necessary in the preparation of the details of a scheme of sewerage and water supply can readily be obtained by referring to the "suggestions" published by the Local Government Board, and types of sections of manholes, lamp-holes, earthenware pipe-sewer junctions, flushing-chambers, outfalls, tidal flap arrangements, &c., are furnished at a trifling cost, saving an immense amount of labour and thought. No two plans present the same features in respect of drainage conditions; one town may have a flat surface, another a hilly and precipitous area, and a third a very low, level site, each requiring a different treatment of sewerage and interception. On level sites the construction of manholes and junctions do not present much difficulty; but in steep gradients it becomes necessary to divide and arrest the rush and scour of water upon the inverts of sewers to prevent wear. The details furnished in Mr. Rawlinson's sheet show how this may be effected by ramps and "tumbling bays," and the uprush of gas shut off by flaps on the ends of inflowing sewers. The back-watering of the branch sewers is also a common occurrence in steep gradients, but the manner shown of placing the inlet and outlet portions of the sewer on different levels in the manhole reduces the risk, as the main sewers must run quite full before there is any danger experienced. All the junction pieces entering the manhole, also the overflows, are shown of cast-iron, and when a number of junctions have to be made it is the cheapest material. Plans and sections of manholes for brick sewers on steep gradients are given in sheet No. 2; and not the least useful are the sections of flushing chambers for flat districts, and the main outlets for steep sea cliffs or flat shores. To the description is appended some useful memoranda on materials. It is recommended, for instance, that a good hydraulic mortar for sewer work be made of 2½ of clean, sharp sand, to 1 by measure of ground Portland cement, or lias lime. Half a measure of clean ashes or slag is a good substitution for that amount of sand. For inverts of manholes and sewers, concrete made of 5 of gravel and sand to 1 of fresh cement or lias lime by measure, may be used, though broken stone, bricks, &c., may be substituted for the gravel. Some useful observations on mixing mortar, concrete retaining walls, tanks and sewer-construction follow. The author proposes a good water-tight sewer, that will exclude subsoil water, by forming the invert in concrete floated in cement mortar, and building the brick inverts in two 4½in. rings, one within the other, and with a 1in. layer of cement between them. A number of practical suggestions will also be found appertaining to water supply.

DOMESTIC FIREPLACES.

THE recent paper by Dr. Carpenter on London Fogs goes to prove that the London fog, and, in fact, the fogs of all large, thickly-populated cities are due to unconsumed fuel, and the imperfect heating apparatus we now employ. One of the leading facts which press upon the manufacturer of our domestic stoves, is the construction of fireplaces which shall diminish the production of smoke by a more perfect combustion of the fuel. The introduction of slow-combustion stoves—such as those manufactured by Messrs. Barnard and Co., the Manchester Grate, and those manufactured of fireclay by Messrs. Doulton and others—is a step in the desired direction; and it may be necessary to direct the architect's attention to what must shortly become a recognised principle in construction. It is quite certain that a departure from the old type of fireplace, with its iron grate, must be made, if for no other than economical grounds, as it is well-known; and Dr. Carpenter reassures us that not more than one-sixth of the coal now consumed is usefully employed. The author suggests gas-fires as alternatives for open fireplaces, and no doubt for halls and consulting-rooms, they perfectly answer, but there are disadvantages in its use which the ordinary consumer of fuel would not readily put up with, such as the smell they sometimes give out, and the dryness of the air occasioned by them—faults which, as Dr. Carpenter showed, are more from imperfect construction than inherent in the use of gas-fires. The gas-fire could be fitted to any ordinary grate at the expense of laying on gas. In many houses the use of gas would effect a great saving, for it would save one servant, as there would be no dust, no fires to light, and no chimney-sweeps employed. The great advantage of a gas-fire in a sick-room is unquestionable: the patient is not disturbed by constant poking, so wearisome to the invalid, and the temperature of the room can be regulated at pleasure.

The recommendations of Dr. Carpenter are simple. As fuel smoke is considered the cause of the intensity of town fogs, he would abandon it, and also as wasteful in the extreme, since 5-6ths of the developed heat is lost, and much of the fuel passes away unconsumed; he, therefore, proposes to substitute gas at a cheap rate, so that it might be used for cooking as well as for heating; to prohibit the sale of coal in the metropolitan district, unless it had been previously deprived of its smoke-producing quality; and to put a tax upon fireplaces not constructed so as to consume their own smoke. Great opposition would be experienced in carrying out these proposals. To tax fireplaces would be to raise a storm of dissentient voices, and to prohibit the use of coal would be to run counter to the traditional custom of ages. But architects and manufacturers may do something at once to avert the mischief, and so postpone the radical change. They can construct their fireplaces upon the shallow plan of throwing out the heat into the room by cutting off the angles and lining the fire-box with fireclay, or they might endeavour to combine the principle of the slow-combustion fireclay stoves with the fireplace. We are sure a few well-conducted experiments would lead to a plan of constructing the fireplace that would be much simpler than the use or fitting of patent stoves, and we believe that the principle would admit of architectural treatment.

THE SOCIETY OF PAINTER ETCHERS.

IT is announced that the first exhibition of the Society of Painter Etchers, founded in July last, will be held at the Hanover Gallery, 47, New Bond-street, on Monday, April 4th. The exhibition will be of a novel character, being promoted with the twofold aim of representing the art of original engraving in all its forms, and of selecting the original Fellows of the new society. Works will be accepted from any source, but they must be original, and if for sale the *bonâ fide* property of the artist, and all forms of engraving on metal, whether with the burin, the etching-needle in mezzo-tint, or aqua-tint, "or by whatever other process the artist may choose as a mode of *original* expression" will be admissible to the exhibition. It is provided that at a date not later than the first Monday in May, 1881, the provisional council are to assemble in the gallery of the exhibition, and adding for the occasion three persons to their number, two of whom shall be members of the Royal Academy, they will prick off, each on a separate list, the names of those exhibitors who from the character of their exhibits appear specially to recommend themselves as Fellows of the Society; and afterwards, uniting in special committee for the purpose, "will proceed to elect as many as may then be determined upon of those exhibitors into the society, the persons so elected to constitute, with the provisional council, the roll of the society, and to become, *ipso facto*, its first Fellows." All works intended for exhibition must be addressed to "the Secretary," at the Hanover Gallery, 47, New Bond-street, and delivered free of charge, unpacked, and ready for hanging on Monday, March 14th, between the hours of 10 a.m. and 10 p.m., and if from a distance, to an accredited agent in London, who will unpack and deliver them at the gallery.

ROYAL ACADEMY ARCHITECTURAL SCHOOL.

ADMISSIONS, JAN. 1ST, 1880.

STUDENTS OF UPPER SCHOOL.—J. B. Phillips, J. C. Yates.

LOWER SCHOOL.—W. J. Allen, H. R. Best, Charles Burton, J. C. Carter, T. J. Dalziel, A. Heningway, E. W. Jennings, J. W. Johnson, E. Nevinson, J. F. Newton, F. Simpson, E. J. Slow, N. J. Stanger, P. Thicknesse, G. W. Winchester.

PROBATIONERS.—G. Blizard, E. B. L. Boyce, G. C. Horsley, H. H. Kemp, Arthur Kent, A. Leslie, H. W. K. Martin, H. G. Nixon, Herbert Read, Thomas Sims, J. A. Slater, R. E. Smith, C. H. Stock, W. Toogood, J. R. Withers.

The chancel of the parish-church of Pulborough, Sussex, was reopened on Christmas-day after the removal of the long deal benches and desks and other fittings, and their replacement by choir-stalls and two prayer-desks, richly carved in oak. The new seats have been made from the designs of Mr. James Fowler, of Louth.

The new chancel of St. James's Church, Croydon, was opened by the Archbishop of Canterbury on Friday week. It measures 36ft. long by 21ft. wide, and has been built from the designs of Mr. C. Henman, as the first portion of a reconstruction scheme, and was illustrated in the BUILDING NEWS of Oct. 29, 1880. Messrs. Laing and Co. were the contractors, and Mr. S. A. Clark, the clerk of works.

ENTRANCE VESTIBULE TO SOMERSET HOUSE.—CAPS FROM CANTERBURY CATHEDRAL.—ARTISTS' HOMES: NO. 10 "YATTENDON," NEAR NEWBURY, THE RESIDENCE OF ALFRED WATERHOUSE, ESQ., A.R.A.—ROWDEN ABBEY.

OUR LITHOGRAPHIC ILLUSTRATIONS.

VESTIBULE TO SOMERSET HOUSE.—ROYAL ACADEMY PRIZE-MEDAL DRAWING.

ONE of our double-page plates to-day illustrates the beautiful drawing of the vestibule to Somerset House, for which Mr. Fredric Miller has just been awarded the Royal Academy medal for Perspective in outline. On Jan. 3 last year we published some measured drawings of the same gateway, for which the Royal Academy first silver medal prize was awarded in December, 1879, the author being Mr. R. W. Gibson. Further details from the same set of drawings were given in the BUILDING NEWS on March 21 last.

CANTERBURY CRYPT CAPITALS.*

IN the few minutes which it is customary to devote to a visit to the crypt of Canterbury Cathedral one is not so likely to be struck with any carving there may be as the general extent of the place itself. The great crypt, into which we first descend from what is known as the Chapel of the Martyrdom of Thomas-à-Becket, is described as the largest in the kingdom, and its long perspective of intersecting arches and groins is rendered, perhaps, more impressive by the semi-darkness which lends its mystical influence to the view. A gleam of light, however, may chance to fall across one of the pillars, and then your attention may be directed to the curious characters that are graven on the capital, and passing from one to the other, the archæologist or dilettante visitor is soon led to remark, in spite of "Time's defacing fingers," the tragic and comic interest with which most of them have been invested. Here is one displaying the interlacing character peculiar to Saxon ornament; there another indicating some degree of advance into the commencement of the Norman epoch. The exact date to be ascribed to the foundation of this imposing edifice has been the subject of some divergence of opinion among antiquarians, although the difference is one admitting of an explanation that has been adopted by Britton, as well as other eminent authorities on the subject. This may be put in a few words in referring to the events in the history of the crypt. After the general destruction of the edifice by fire, in A.D. 1070, Archbishop Lanfranc succeeded to this See, and commenced the entire reconstruction of the church from its foundations, and consequently some, if not all the existing pillars in the old, or, as it is called, the Great Crypt, may be safely attributed to this period, though not at present standing in their original positions,—the latter circumstance being explained by the fact that Priors Anselm and Ernulf, who succeeded Lanfranc about twenty years after, pulled down his choir and rebuilt it on a more extensive scale. As, therefore, the new piers of the proposed choir would no longer correspond with the limited arrangement of Lanfranc's pillars in the crypt below, we might naturally conclude that, while they retained the pillars themselves, they altered their positions to suit the new points of the proposed superstructure. This hypothesis, while reconciling the date of the pillars with their present position, is partly strengthened by the appearance of the groining being later in character than the shafts supporting it. It is quite probable that the date of the carving with which the capitals are embellished extended over a period of some considerable duration, generally included between the dates of 1090 and 1135. In these strange conceptions the execution is necessarily rude; but we must remember how important they might be as expressions of the faith of those by whom they were designed and the primitive condition of the times. By means of these outward forms, rude as they may appear, the chief incidents of the Christian religion became intelligible to all, and assisted in inspiring them with feelings of devotion and love. In many cases these symbolical representations may be clearly interpreted, although the specimens on which the selection has fallen for illustration, are remarkable rather for curiosity or grotesqueness of design than for any very clear symbolical meaning. Two of these appear to represent warriors, one going to, the other presumably returning from, the wars, indicated in the latter by his exultant attitude with a recumbent figure under his feet. The centre one we should be inclined to suppose might have been intended as a representation of the face of Jesus, and possibly indicating his last moments on the cross. The lower row, though rich in conception, are a little doubtful in meaning. The dragon, as is well known, is almost universally used as an emblem of Sin or Satan, and the meaning of the action in spearing a wolf with his fork possibly is to illustrate his final victory over the wicked. The musical vein of the next is apparent, and may possibly be illustrative of one of the numerous exhortations in the Psalms to praise God with "stringed instruments and organs," or "Let everything that hath breath praise the Lord," thus figuratively including the animal creation. If, however, any symbolical meaning is to be attached to the last in the set, it is beyond the writer's interpretation. Many of the shafts are ornamented with Norman enrichments. It is not so easy to discover what the bases are like, they being buried in the accumulated rubbish and soil of centuries' deposit. Once more reverting to the general condition of the crypt, it cannot but be deplored that while so large a sum has just been expended in the appointments of the beautiful choir above, that something might not have been devoted to the proper maintenance of this ancient monument of the past. But although Mr. Neale has been engaged in the restoration of the portion appropriated by Queen Elizabeth to the service of French Protestants, the main body of the crypt is left in the most neglected condition. No longer retaining its legitimate character as sacred to the relics of departed saints, it is everywhere desecrated by such utilitarian purposes as coals, lumber, and pipes. The floor, once beautifully paved, is now but of common earth, damp and uneven; the exquisite chapel at the eastern end, dedicated with such former splendour to the Virgin Mary, is unkept and uncared for, and dedicated now apparently to nothing but dirt, darkness, and decay. Such, I regret to say, is the present condition of what Britton says claims distinction as the oldest, finest, and most interesting crypt in England; and whether viewed in regard to "extent, construction, or ornamental detail, must alike excite the admiration of the architect and the antiquary."

* The complete series of 24 sheets is published in a limited form by J. Donkin, 17, Argyle-road, Kensington, W.

ARTISTS' HOMES.

WE give this week illustrations of a house, at present in course of construction by Mr. A. Waterhouse, A.R.A., for his own residence. It is situated at Yattendon, a small village about ten miles to the west of Reading, in a district interesting alike from the beauty of its scenery and its historical associations. At the east end of the village there rises a hill of meadow-land, skirted by picturesque woods, on the summit of which, some 450ft. above the sea level, stands a clump of tall and weather-beaten silver firs, which serve as a landmark for miles around. The house is placed under the shadow of these firs, and is approached through a wood, by a drive which leads to the open (oak) porch on its north side. The arrangements of the interior will be sufficiently explained by the plans of the chief floors, which we give herewith. The principal staircase, with a double arcaded screen at its head, is of oak; so are the fittings of the hall. The woodwork of the library, which is surrounded with shelves for books and drawings to the height of about 8ft., is of American walnut; that of the dining-room, of a combination of walnut, mahogany, and ebony. The woodwork of the parlour, and that of the "Upper Parlour" or boudoir, is painted; the rest of the house is of varnished pitch-pine. The fireplaces, some of which are commodious and furnished with seats, are of the simplest form, lined with glazed fireclay and tiles; the fires, either of coal or wood, being made on the hearth, without the use of any sort of grate. The external walls are hollow, bonded with Jennings's patent glazed terra-cotta ties, and faced with red bricks of an excellent colour, made on the spot, with a considerable admixture of buff terra-cotta. The roof is covered with red Ruabon tiles. The upper part of the tower on the west side of the house is occupied by a large cistern, intended for use in case of fire. From the lead flat above the cistern, an extent of view is obtained probably unequalled in this part of Berkshire. On the north stretch the Compton Downs. On the east one sees the valley of the Kennett, towards Reading, the town itself hidden by the hills dividing this river from the Thames, while beyond are two hills, S.W. of Windsor. It is even reported among the villagers, that the Royal Castle itself (distant 25 miles) could be seen before the growth of the woods obstructed the view. But it is on the south that the prospect is most varied and extensive. About a mile off rise the wooded slopes of Frilsham, with undulating corn-fields in the foreground. On the left, the land slopes to the little river Pang, where it flows through Stanford Dingley on its way to the Thames. On the right rises the dark ridge of Cold Ash Common and Grimsbury Castle, while beyond are the blue hills of Hampshire, above Kingsclere and Highclere, terminating abruptly at Walbury Beacon, nearly 1,000ft. high. In making the excavations for the house, the remains of a beacon were brought to light. The interest of the site was further increased by the discovery, about the same time, of a remarkable hoard of bronze implements, which were exhibited and described to a meeting of the Society of Antiquaries by Mr. J. Evans, V.P., 5th Dec., 1878.

ROWDEN ABBEY.

THIS new house, of which we give two views, with ground-plan, is built on the hill-side, a short distance above the site of the abbey from which it takes its name. Of the latter there remain only some fragmentary portions of the walls, and a small bridge which once spanned the brook, and formed the approach to the abbey. The half-timbered style has been chosen for the new building, as being suitable for the locality, the site being a short distance from the boundary between Worcestershire and Herefordshire, where many old timber-built farmhouses and cottages still remain. The construction is of solid oak framing, on a foundation of local stone, with brick chimneys and brown tiled roofs. The hall and dining-room are panelled in oak framing, with ribbed ceilings, the whole of the joiner's work in the best portion of the house being executed in oak. The work has been well carried out by Mr. Thos. Espley, of Eccleshall, Staffs., Mr. Jas. Hodgson being the clerk of works. The architect is Mr. John Douglas, Chester.

A stained-glass window has just been placed at the west end of Holy Trinity Church, Hastings. In the upper tracery is a representation of the "The Majesty," and in the six lights beneath are figures illustrating the dedications of the following local churches:—St. Leonard, St. Mary Magdalen, St. John the Evangelist, St. Mary the Virgin, St. Andrew, and St. Clement. Beneath each figure is a medallion group representing an incident in the life of the saint. The window is the work of Messrs. Clayton and Bell, of Regent-street, London.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

REPRESENTATIVES of the Press were, for some reason, excluded from the ordinary meeting of the Institute, held on Monday evening, but from the *Proceedings*, issued yesterday, we are enabled to epitomise the business of most general interest.

The President, Mr. Whichcord, occupied the chair, and 14 gentlemen were elected as fellows, 30 as associates, three as hon.-associates, and six as hon. and corresponding members.—The death was announced of M. Hector Martin Lefuel, of Paris, vice-president and inspector-general of the Conseil des Bâtiments Civils. On the death of Visconti he was appointed architect to the palaces of the Louvre and Tuileries, and held the office until he died. He was a past-president of the Société Centrale des Architectes, Paris, and he acted as Chairman of the Jury in the Fine Arts Section of the Paris International Exhibition, and as President of the International Congress of Architects held in that city in the same year.—Mr. Joseph Clarke formally presented to the Institute a portrait of Mr. Charles Barry, ex-president, painted by Mr. Lowes Dickinson, and the subject of the portrait declared it to be a high work of art, and expressed his thanks to the artist for having bestowed on it an amount of labour for which he certainly could not receive anything like a due recompense.

ST. MARK'S, VENICE.

The following letter was read :—

14, Cavendish-place, Cavendish-square, W., Dec. 31, 1880.

DEAR MR. WHITE,—I inclose some of the circulars of our committee (St. Mark's, Venice, Committee). I think many of the Fellows and others of the R.I.B.A. will like to hear of the existence of the committee, but I do not know that there is anything I need add to the statement of the objects contained in the circular. I am glad to say that the Academy of St. Luke has expressed lately a decided view as to the recent restorations, and I am sanguine enough to believe that, for the future, works of absolutely necessary repair alone will be executed at St. Mark's.—Believe me, yours very truly,

GEORGE EDMUND STREET.

The circulars stated that the committee, individually, and as a body, being actuated by the most cordial and friendly feelings towards the Italian nation, would take care to act as delicately as possible by friendly representations, and with every determination not to wound any national susceptibilities, or to take exception to what are plainly necessary repairs. The committee, with power to add to its numbers, consists of representatives from Venice and other parts of Italy; from Paris, Vienna, Stuttgart, Zurich; from America, Holland, and the United Kingdom. Mr. Street is the vice-chairman, and Mr. Henry Wallis the hon. secretary. The offices of the committee are at 9, Buckingham-street, Strand, W.C.

Mr. EWAN CHRISTIAN said :—I paid a visit last October to Venice for the purpose of seeing St. Mark's before it was destroyed, and I hope that a great number of the members will join this committee, for I believe that its action or the agitation it has commenced was the means of stopping a work which would have utterly destroyed the west front of St. Mark's if it had been persisted in. Mr. Street some months ago wrote to the *Times*, and also spoke at a meeting of the Society of Arts—not describing what was proposed to be done, but what was actually being done. If the proposed new construction had been proceeded with, the whole of the west front of St. Mark's must have been rebuilt—every part must have been re-set, and we all know what the re-setting of St. Mark's would mean. A more thorough destruction of an ancient monument could not be imagined. All the mosaics must have gone, and almost the whole of the interesting irregularities, for there is an immense number of them in the present front, and they would all have been destroyed. That has been stopped, and from the fact of the hoarding being cleared away, it is tolerably evident that they do not intend to go upon these lines in future. But on the other side they are carrying out the removal of the casing and the re-setting of it, and they are doing it in a way which would horrify gentlemen sitting in this room—without the slightest care or protection of the capitals of the pillars. When I was there only some scaffold boards, upon which the men were working, were laid upon the abutments and upon the scaffold poles; they were hammering away at the brickwork, which is the background of the marble facing, and bricks were tumbling about as fast as they could. It is really sad to think of the destruction that may be caused even if this kind of "repair" is carried out, because in such a building very little carelessness on the part of the workmen may be irreparable.

Mr. C. BARRY added, as his belief, that the sympathy of a large number of the members of the Institute would be with the movement to preserve intact the grand old basilica of St. Mark. The paragraph of the report which said that the committee would take the greatest possible pains not to offend the national susceptibilities of the Italian nation, would, he thought, remove all hesitation which had weighed on many in joining the movement. If we were so imprudent, to say the least, as to place themselves in a position of dictating to the artists of a foreign nation, they would not unnaturally resent it, as we should do under similar circumstances. This feeling had probably prevented that adhesion and sympathy being outwardly expressed which all inwardly felt.

FINE ARTS EXHIBITION AT MADRID.

Copies of translations of the proposed regulations for the general exhibition of fine arts, to be held at Madrid in April next, were placed on the table, and a letter relating to them was read by the secretary from the Marquis de Casa Laiglesia, of the Spanish Legation in London.

EXAMINATION REGULATIONS.

The President introduced the subject of the examination under By-law XIV. by an address, in which he described the proceedings in committee which had resulted in the formulation of proposed regulations, and a programme of the architectural examinations. These proposals were printed and issued to members just before Christmas-day. With the assent of the Rev. Richard Aspitel, a modification would be proposed to be made in the Aspitel prize, which it was recommended should henceforth be given once a year instead of biennially, and to that successful candidate who, during the year's examinations, should distinguish himself most creditably in any one of them. He then formably moved that the regulations and programme of the examination under By-law XIV., as approved by the council, and printed on pp. 95 to 98, inclusive of the *Journal of Proceedings*, 1880-81, be received and adopted.

The motion having been seconded by Mr. Arthur Cates, a discussion ensued, in which Messrs. Lacy W. Ridge, Robert Walker, Ewan Christian, H. Dawson, E. C. Robins, C. Fowler, J. Douglass Mathews, E. G. Bruton, R. Phené Spiers, Robert Kerr, T. H. Watson, J. S. Quilter, H. H. Stannus, H. L. Florence, C. Barry, and the President joined; and it was resolved "That the regulations and programme of the examination under By-law XIV., printed on pp. 95 to 98 (inclusive) of the *Journal of Proceedings*, 1880-81, be adopted, subject to the insertion after the word 'plan,' on page 98 (ninth line), of the words 'section and elevation.'"

LUMINOUS PAINT.

MESSRS. IHLEE AND HORNE, 31, Aldermanbury, E.C., have just coated a ceiling at their offices with Balmain's luminous paint, or, in this case, water-wash. The effect is that of a subdued light, every object in the room being clearly visible, so that in a room so treated one could enter without a light, and find any desired article. The luminous paint is excited by the ordinary daylight, and its effects continue for about 13 hours, so that it is well adapted for painting bedroom ceilings, passages that are dark at night, and other places where lamps are objectionable or considered unnecessary. For staircases and passages a mere band of the paint will serve as a guide, and costs but a trifle. For out-door purposes the oil-paint is used, but for ceilings and walls the luminous paint, mixed with water and special size, can be used the same as ordinary whitewash, and presents a similar appearance in the daylight. We have previously given a short account of the many applications of which this paint is capable (see p. 155, Vol. XXXVIII.), but the comparatively recent discovery that it can be applied as ordinary whitewash considerably expands the field of its usefulness. Sheets of glass coated with the paint form Aladdin's lamps, which are in use in some of the vessels of the navy, at the Waltham Powder Factory, at Young's Paraffin Works, and in the spirit-vaults of several docks; but now that, by increased production and the use of water as the medium its cost is reduced by one half, it will probably be extensively used for painting walls and ceilings. The ordinary form of oil-paint has already been applied in many ways, to statues and busts, to toys, to clock-faces, to name-plates, and numbers on house-doors, and to notice-boards, such as "mind the step," "to let," &c. The paint emits light without combustion, and therefore does not vitiate the atmosphere. The room at Messrs. Ihlee and Horne's can be seen by invite card on any day from 10 a.m. to 4 p.m., and a visit will convince any one of the value of the paint for the purposes named. Several experimental carriages are now running on different railways, the paint being used instead of lamps, which are necessary all day on account of the line passing through occasional tunnels.

ROMAN REMAINS IN THE TOWER OF LONDON.

MR. E. LOFTUS BROCK, F.S.A., gives a brief report of a discovery recently made within the walls of the Tower, of no small interest in relation to the course of the old rampart of the City of London. Many readers will recollect the existence of a range of modern-looking buildings close to and obscuring the east side of the old White Tower. These have recently been demolished, to the great improvement of the keep, which is now opened to view, and which reveals a large portion of the old Norman masonry of its walls in excellent condition. The modern buildings have been cleared away down to their foundations. During the visit of some of the country members of the British Archæological Association in November last attention was drawn by the courteous authorities to a wall which had been noticed among the foundations, and in part demolished by them, but which had formed no part of the removed buildings. We pronounced this wall to be Roman work, and suggested that it should be opened out. The Major of the Tower, Major-General Milman, C.B., at once had this done. Since then Her Majesty's Office of Works have cleared it down to its foundations, and it is now open for public inspection.

The wall is so exactly of the same construction as that recently found in America-square as to point to the same origin. In fact, this and that are but two portions of the same wall. There is the same foundation of clay and flints, the facing of somewhat small stones of square rag, the same dark brown ironstone chamfered plinth on the outer or country side, and the same double course of bright red tiles going through the entire thickness of the wall; all pointing to similarity of design and date of construction. Unfortunately, the extreme height here is only 6ft. 4in., and the length only about 11ft. 6in. The thickness is 6ft. 10in. above the plinth. It commences at the extremity of the well-known Horse Armoury Gallery, and ends abruptly where it was cut through many years ago to form an underground approach to the vaults of the White Tower, when they were used for the extraordinary purpose of gunpowder storage. The wall, doubtless, may be found still further northwards, and it is greatly to be desired that excavations may be made to open for inspection a greater length of this the only fragment now visible from above ground of the old wall of the Roman city.

The course of the fragment is remarkable. Were a line drawn from the well-known existing remains of the City wall in Cooper's-row it would all but touch its southern end; this line would be inclined to the White Tower, but parallel to some of the paths and buildings to the east of it. The fragment, however, has no reference to this, its theoretical course from its point of junction, since it is more parallel to the White Tower itself. The reason of this change of direction will probably be determined when the wall is opened to a greater extent, and which will clear up the interesting inquiry as to whether or not the wall had any connection with any buildings on the site of the Tower. Its course southward would be in the direction of the spot where the foundations of a massive tower were met with about 1720, and close to that where an ingot of silver and three late

Roman gold coins were found about 100 years ago.

The southern extremity of the fragment is lost under the modern walling of the Armoury, and in a mass of masonry of semicircular form. This is the base of the mediæval Wardrobe Tower, and which projects from the eastern, or country face, of the wall. The lowest portion of this is of earlier date, and, although of different construction from the Roman wall, yet the rough masonry is here and there cemented with red mortar formed of powdered Roman brick—a peculiarity that does not occur in the wall itself. This probably may prove to be a fragment of a third instance of a bastion of Roman work built against the rather earlier wall—the two others being that found in Camomile-street in 1876, and that found in Duke-street, Aldgate, a few weeks ago.

The thanks of the British Archæological Association for so far opening out these remains have been rendered not only to Major-General Milman and to Her Majesty's Office of Works, but to Mr. John Taylor, who, in his capacity of surveyor to the department, has taken much interest in this curious discovery. The portion of the wall opened to view will be found close to the east face of the White Tower.

ARCHÆOLOGICAL.

ANOTHER CLIFF-TOWN DISCOVERED.—The occurrence of ancient cliff-towns, built upon or rather in almost inaccessible places along the precipitous sides of river canons in Colorado and New Mexico, was made known several years ago. Another very important discovery of this nature was made a short time since by Mr. James Stephenson, of the U. S. Geological Survey, in New Mexico. The city lies in a canon thirty miles long, never before visited by white men, and is about forty miles from Santa Fé and ten miles from the Rio Grande. It consists of a succession of excavations in the solid rock throughout the length of the canon, making, perhaps, the largest cliff town yet discovered. The houses are dug out of the rock side to a depth of from fifteen to twenty feet. Apparently they were excavated with stone implements. They are almost inaccessible from the plains. Mr. Stephenson, however, managed to clamber up the rocky precipice, and entered and examined a number of articles that he thought remains of their first possessors. A scientist who has travelled in that region and visited other caves and excavations of a similar kind says he is disposed to believe that they have been tenanted within modern times by Indians at war with other tribes, seeking safety and advantage over their enemies. He thinks the remains found there are the remains of the things these belligerents have used, eaten, or worn, and not the relics of the first owners of the rock houses.

BROMHAM.—During the recent Congress of the British Archæological Association at Devizes in August last an ancient Roman villa in this neighbourhood was visited and inspected, and so interesting did it prove a general wish was expressed that a thorough and complete examination might be instituted, as it was felt important and interesting discoveries might be made. Mr. Butler, upon whose farm the remains are situate, having kindly given full liberty for this to be done, a local committee has been at work at Bromham during the past week, and the result of their labours has been such as to justify the predictions made. The labours entered upon have so far, of course, only been of a preliminary character, but several articles of pottery, urns, and coin have been discovered, and the foundations of several chambers have been unearthed; also a length of wall, probably not less than 200yds. in extent, and varying from two to four feet in thickness. The outline of the villa may now be very fairly seen. The examination of the courts and apartments will be deferred until next summer, when doubtless, matters of importance to archæologists will be revealed.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—An ordinary meeting was held at the rooms of the Association, Queen's College, on Tuesday evening last, at which a paper on "Architectural Physiognomy" was read by Mr. Fred. W. Cross.

COMPETITIONS.

BRIGHTON.—The town council of Brighton decided on Wednesday to institute a competition for designs for a clock-tower and urinal to be erected in North-street. Premiums of £20, £15, and £10 are offered. The designs are not to exceed £1,500 in cost of erection, exclusive of the clock, and are to be sent in before 4 p.m. on March 3rd next.

CLITHEROE DAY AND SUNDAY-SCHOOLS COMPETITION.—The committee, on the 22nd ult., placed the five designs, reviewed last week, in the following order of merit, viz.—"Limestone," by Mr. W. S. Varley, Blackburn; "As You Like It," by Mr. R. Knill Freeman, of Bolton and Derby; "What do You Think," by Mr. Edward Clarke, London; "Octagon," by Mr. J. Wardle Bulcock, of Blackburn and Clitheroe; "Simplex," by Messrs. Bromilow and Cheers, Liverpool, the first and second premiums being awarded to the first two named.

THE ROWLAND HILL MEMORIAL.—A meeting of the Mansion-house Committee of the Rowland Hill Memorial Fund was held on Thursday, when the total of the fund was reported to amount to £17,286. In regard to the statue of Sir Rowland Hill, at the site in Royal Exchange buildings, the sub-committee reported that they had received 14 models, nine being of erect and five of sitting figures, and that, having visited the site and taken occasion to see most of the public statues in the metropolis, they were strongly and unanimously of opinion that the statue should be an erect and not a sitting figure. Sir Frederick Leighton had, on the invitation of the committee, placed his services at their disposal in the selection of the best work of art, and had suggested that the committee should also ask two senior sculptor members of the Royal Academy to act with him, and that their award should be final. The committee proposed, therefore, to invite Mr. Calder Marshall, R.A., and Mr. Woolner, R.A., to join Sir Frederick Leighton as umpires, and they proposed, on receiving the final award, to make the necessary arrangements with the successful artist for the erection of the statue, in accordance with the conditions laid down. The report was adopted unanimously.

TORONTO.—The competition for public buildings at Toronto has resulted very badly, according to the *American Architect*. Although arranged with remarkable fairness and care, the terms of the competition required such a vast amount of useless work as to make it impracticable for architects with other important engagements to compete, and the absence of any guarantee that the award should be made by professional judges operated still further to deter the best class of designers. Sixteen sets only of drawings were received at the appointed time, nearly all, it would seem, from local architects, and, in accordance with the agreement, three of these were allotted premiums, the first, of two thousand dollars, being given to a plan marked "Datur Digniori," the second, of one thousand dollars, to one entitled "Waterloo," and a third, of five hundred, to "Nox." So far from the object of the competition being attained, however, by the awards, the experts declined to recommend any of the prize designs for execution, considering them all unworthy of the site, and although the Government acquires the title to the premiated plans, it is understood that they will not be used, and the Province of Ontario is, after paying away its thirty-five hundred dollars, as far from having a convenient and creditable public building as ever. One design only received mention as being "architecturally good," but its cost was excessive. A competition for a great public building which results in the production of but one good design, and that too costly for use, must be regarded as a practical failure; which in this case is the more to be regretted on account of the evident desire of the officials who directed it to obtain the best result result by the most honourable means.

A meeting of the Broadstairs Pier and Harbour Commissioners was held on Monday evening, when it was resolved that a jetty, 455ft. long, be erected in a northerly direction from the old pier.

The Tottenham Local Board, on the 21st Dec. last, accepted the tender of £19,708, of Mr. John Bell, contractor and builder, Wood Green, N., for Limmer asphalte paving, granite kerb, and crossings, for contracts No. 5, 4, 3, and 2.

Building Intelligence.

ASCOT.—The old rectory at Ascot has been considerably enlarged by the addition of an oratory and schoolroom for the Rev. W. Kirk Pierce, at a cost of £1,020, by Mr. W. Watson, builder, of Ascot, under the superintendence of Mr. Byrne, architect, of Windsor, and 12, Buckingham-street, Strand. The four stained-glass windows in the oratory were executed at the Royal Stained-glass Works at Old Windsor, from the designs of Mr. Westropp, of that establishment.

HANLEY.—The School of Art, which has been closed eight months for additions and alterations, will be reopened on Monday, the 10th inst. The school, previous to the additions, consisted of one room 60ft. by 36ft., which had to serve both for elementary and advanced students; and a library, 25ft. by 15ft., on the first floor, with modelling-room, over the library, formed in the roof. The whole were approached by a narrow and inconvenient entrance and staircase. The accommodation provided for only 75 students, but generally the attendance numbered upwards of 120. The alterations consist of an additional story over the old school, containing antique room, 38ft. by 36ft.; modelling-room, 22ft. by 36ft.; and life class-room, 15ft. by 29ft. The old schoolroom has been remodelled, and the space occupied by the old staircase utilised; the accommodation on this floor now consists of an elementary room, 46ft. by 36ft.; architectural and mechanical room, 15ft. by 36ft.; library and designing-room, 13ft. by 14ft.; attendant's room, and ladies' cloak-room. The whole are approached by a new and commodious entrance and staircase, at the rear of which are a casting-room and closets and lavatories. The school will now conveniently accommodate upwards of 200 students. The schoolrooms are ventilated by means of Shillito and Shorland's inlet ventilators and specially constructed windows, and by Messrs. Hill and Hey's siphon outlet ventilators, and are heated by hot water. Mr. Nicholas Bennett, of Burslem, has been the contractor for the additions and alterations. The whole has been erected frem the designs and under the superintendence of Mr. Ralph Dain, architect, of Hanley and Burslem.

HORNSEY.—The Bishop of London consecrated the new church of Holy Trinity, South Hornsey, on Friday, Dec. 31st. It supplies the place of an iron one, lately erected, which was found inadequate for the wants of this vastly increasing suburb. It was designed by Mr. C. B. Terry, 15, Spring-gardens; the builder was Mr. T. Boyce, Hackney. The brass lectern, gas-fittings, Communion-rail, and other furniture were supplied by Jones and Willis, of London and Birmingham.

LEVENSHULME.—The foundation-stone of a new Congregational church was laid at Levenshulme on Saturday last. The church is being erected upon a site adjoining the present school, and is 64ft. long by 43ft. wide, and 49ft. to ridge of roof. Two vestries are placed on the south side. A spire will stand at the north-west angle, the lower stage of which forms the principal entrance to the church, and opens through folding doors into a vestibule which occupies the entire length of the front. Internally the fittings will be of pitch-pine; accommodation being provided for 400 persons. Provision will also be made for the erection of a future gallery, to contain 100 additional seats. Increased class room and other accommodation will also be provided in connection with the present school. The total cost will be about £3,300. The building is being carried out under the superintendence of the architect, Mr. John Lowe, F.R.I.B.A., Manchester; Mr. W. W. Harrison, also of Manchester, being the builder.

The annual prize distribution, in connection with the Norwich School of Art, took place on Wednesday week at the Free Library in that city. It was reported that the school was in a prosperous condition, both as to number of students and finances. An encouraging address was delivered to the students by Mr. Walker, President of the Liverpool Society of Water-Colour Painters, and art referee to the Southport Corporation, who, 30 years ago, was a student in the Norwich school.

More than Fifty Thousand Replies and Letters on subjects of Universal Interest have appeared during the last ten years in the ENGLISH MECHANIC AND WORLD OF SCIENCE, most of them from the pens of the leading Scientific and Technical Authorities of the day. Thousands of original articles and scientific papers, and countless receipts and wrinkles embracing almost every subject on which it is possible to desire information have also appeared during the same period The earliest and most accurate information respecting all new scientific discoveries and mechanical inventions is to be found in its pages, and its large circulation render its the best medium for all advertisers who wish their announcements to be brought under the notice of manufacturers, mechanics, scientific workers, and amateurs. Price Twopence, of all booksellers and newsvendors. Post free 2½d. Office: 31, Tavistock street, Covent-garden W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, £1 10s. 10d.; to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. R. M. TUTTLE, of 13 and 15, Laight-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Cases for binding the half-yearly volumes, 2s. each.

NOW READY,

Handsomely bound in cloth, Vol. XXXVIII. of the BUILDING NEWS. Price Twelve Shillings. Order at once, as only a limited number are bound up.

N.B.—Cases and vols. must be ordered through a bookseller or newsagent, as the regulations of the Post-office prevent them from being sent by post.

RECEIVED.—D. B. B.—H. and I.—L. J. C. and Co.—E. W.—P. of N.—A. J. T.—J. S. and Son.—C. H. C.—J. R. F.—G. and G.

"BUILDING NEWS" DESIGNING CLUB.

Correspondence.

PUBLIC GENEROSITY IN COMPETITIONS.

To the Editor of the BUILDING NEWS.

SIR,—One farcical condition in competition instructions is not receiving that consideration which it deserves among those who have already written on this, at present, fruitful theme; we mean the one which states: "If the plans of the first premiated design be adopted, the premium to merge in the commission." As, ninety-nine times out of a hundred, the first premiated plans are adopted, we are lost in wonder at the stupendous moderation of the first premium generally offered. Take the late Liverpool School of Art Competition for instance: the first premium was 100 guineas to be merged in the commission. As the cost of the building was limited to £10,000, the commission would thus be £500. Now, why should the board have been so niggardly as to offer only 100 guineas? Why not have been generous and offered 400 guineas? 300 guineas, more or less, would have been nothing out of their pockets, while a prodigious generosity would have been cheaply obtained.

We commend this suggestion to all future framers of competitions, as, of course, those interested—incipient architects and draughtsmen who have not yet learned to enter a competition, especially one without a referee, unless they know beforehand they are to win—will never detect the fallacy.

The real amount of money awarded by the above board for 96 sets of drawings was the munificent sum of 25 guineas, about five shillings a set, and thus at ten drawings in a set, about sixpence the sheet—the price of the paper without the stretchers.

We believe the large number who entered this competition were induced to do so from the announcement that the drawings would be exhibited.

Most competitors look on such an exhibition as an advertisement, and as such, even if unsuccessful, a remunerative speculation indirectly, especially when the professional journals give them a favourable criticism.

Not to exhibit the drawings was, we think, in this instance, looked on as a great injustice, the labour bestowed being utterly thrown away.

We would suggest as another *sine qua non* in competitions that the drawings be always exhibited.—I am, &c., A. D.

LIVERPOOL SCHOOL OF ART COMPETITION.

SIR,—The thanks of the profession are due to Mr. Walker for exposing the ungenerous treatment which we have received at the hands of the directors of the Liverpool Institute. I certainly accepted Mr. Sharp's statement as a *moral* guarantee that a referee would be appointed, and if, as he asserts, the committee made the selection without favour, could they not have gone a step higher and given the proof-positive of their sincerity towards the profession by seeking the advice of an experienced and eminent architect in arriving at a decision? Such a course could have had no drawbacks in their desire to deal justly, and it would have been a real satisfaction to the large number who responded to their invitation, for while Englishmen can bear defeat, they like to know they have been beaten *fairly*. It is needless for Mr. Sharp to tell the profession that some of the committee had experience in competitions, for no amateur-knowledge is sufficient to grapple successfully with such a large number of competition drawings. While it would be premature to pronounce an opinion on the successful design, the fact of its being conceived in the "Queen Anne" style is an ominous sign that this "Be just and fear not" committee would not have made a great blunder if they had sought the guidance of a ripe and sober judgment.

It is never a healthy sign, and reasonably creates suspicion, when a set of men can't leave their acts to the judgment of the public; and apart from the ungrateful and undignified treatment in refusing competitors the satisfaction of a professional criticism, it has yet to be explained how "Liverpool gentlemen" (as they call themselves in Manchester), can tell people that drawings are packed up and sent off (carriage paid—let us thank them for this generosity) which do not arrive in London for about ten days after.

Liverpool gentlemen! we would not harm you; but need you have treated a liberal response to your invitation scurvily?—I am, &c.

A COMPETITOR.

GLASGOW MUNICIPAL BUILDINGS COMPETITION.

SIR,—I must repeat to "Another Competitor" that the words quoted by him do not forbid blackening windows. An elevation is none the less "in line" because the windows are blackened; and the conditions do not specify that they are to be in line *only*. Colour and etching are excluded, but not blackening. There is no room for doubt as to the meaning of the expression; but the intention of those who drew up the conditions is not equally clear. Several of the competitors accordingly wrote and received private instructions, which can hardly be considered binding on those who heard of them only during the exhibition of competitive drawings. When your correspondent says that "90 competitors out of 96 break rule," he suggests the eleven obstinate jurymen of the anecdote, and casts an undeserved imputation on his profession.—I am, &c., T. L. W.

THE FUTURE OF CEMENT.

SIR,—At the risk of being considered tedious, I must crave a few words more on this subject. Why an observation, which from me is in "bad form," and is "regarded simply as the vapouring of an ambitious would-be cement authority," would have "come with better grace from the President" of the Institution of Civil Engineers, is even less intelligible than the rest of Mr. Reid's latest epistolary effort. Mr. Reid secured a very cautiously-worded notice of his book in the "joint-paper," and he is at liberty to use it to puff his third edition. I am glad he admits his mistake about the formation of a silicate in the humid way. He must really get Mr. W. F. Reid to explain the matter to him a little more fully, however, for he is still foggy on this point. That I am regarded as the "*trade* exponent" of sulphur, selenite, and loam is news to me, though we live and learn. Mr. Reid, when he is facetiously inclined, should try and be more exact—the history of a childhood is not the same as a "child's history."

I wish to take this opportunity of saying that in the paper read at the Institution of Civil Engineers, the paragraph to which Mr. Reid alludes, respecting the nature of Joseph Aspdin's cement, is, when taken in connection with the subsequently-ascertained facts, scarcely just. There can, I think, be no doubt that Aspdin was the first manufacturer of Portland cement, though we have, as stated in the joint-paper, no evidence from his specification that the cement he made in 1824 was identical with what we now call Portland cement. It is satisfactory to learn that Mr. Reid is so much in request by those in search of advice upon matters in which he considers himself so "*experienced.*"—I am, &c.,

GILBERT R. REDGRAVE.

Muswell-hill, N., Jan. 3.

SIR,—With reference to Mr. Reid's remarks in the last number of the BUILDING NEWS, will you allow me to say that no one realises more fully than I do the very great importance of clean aggregates for making concrete, nor has anyone insisted more strongly on this condition being observed on works where Portland cement concrete has been used in very large quantities. I should be glad to know on what authority Mr. Reid makes a statement implying that I am in the habit of allowing dirty or unsuitable material to be used.—I am, &c.,

E. COLSON.

H.M. Dockyard, Portsmouth, Jan. 4.

FIGURES IN GLOUCESTER CATHEDRAL.

SIR,—Can you, or any of your numerous correspondents, inform me with reference to the figures in the reredos of the high altar in Gloucester Cathedral, which was erected some few years since, from the designs and under the supervision of the late Sir Gilbert Scott; whether they are not still simply the original plaster models doing duty for the sculptured marble ones originally intended?

It is stated that the plaster figures have never been removed; but if this statement is incorrect, I should, for one, be glad to be told so, as I believe marble figures were paid for.—I am, &c.

ONE IN DOUBT.

ST. MARK'S, VENICE, AND THE INSTITUTE.

SIR,—Scarcely recovered from the shock of last night at the Institute, I hasten to note, for the benefit of your readers who were not present, the harrowing scene which took place there in connection with St. Mark's, Venice.

After the first portion of the business was completed, there were those signs of restlessness, those whisperings and murmurings, which precede, in meetings, some important communication from the leaders; members huddled together as if for mutual support during the ordeal, the president was graver than usual, the secretary looked defiant—more defiant than ever, and when the hon. secretary rose, one could have heard a crowbar fall. With a printed paper trembling in his hands, and with quivering lip, he read extracts from a circular by Mr. Street, the purport of which I gathered was to invite members to sign a memorial praying that further works at St. Mark's be at once stopped. This ultimatum was received with smothered, but warlike excitement; it required but the word to hurl deadly combat at the Venetians, and the fierce gladiators were only kept back by the paragraph in the circular which advocated calmness

and mercy, and expressed the desire that nothing should be done to wound the susceptibilities of the dire foe. Staggering to his seat, the hon. sec. breathed again, and probably a respite would have been granted—but No! in an instant darted up an old warrior, hissing rage; he had only just returned from St. Mark's, he had the blood-thirst still warm; he had witnessed with the aid of powerful glasses the bloody works going on at unhappy St. Mark's, and back came the desire of every owner of stout heart and arm to rush upon the perpetrators: the sword-hilts were grasped when this old warrior just returned from St. Mark's related how it nearly happened that the west front would be brought out from six to twelve inches, resulting, of course, in an entire rebuilding. How thereby all the "irregularities," all the "wavy lines," all the small pieces of stones," all the results, in fact, of bad setting out and careless workmanship, would be for ever lost. How in one instance where there were some small pieces of marble casing, "single sheets" of marble had been substituted, and how some old paving with "wavy lines" had been taken up, and new paving (he didn't know whether the pattern was the same or not) with straight lines laid in place. The sturdy little Briton had now worked his hearers into the requisite pitch of excitement, and when the last foul deed was recited—when, with distended nostrils, he told how certain capitals were left unprotected, while wretched hirelings were banging away, and brickwork tumbling down; and reached his climax by saying that he had seen *one* capital chipped—then he had lost all command of the band, which thereupon swore death or glory at the west front of St. Mark's. This mighty harangue of the old hero had cost him exertion; fainter and fainter grew his faltering notes until he sank with the words: "Stop the works for ever; leave all cracks as they are; leave the irregularities; leave the wavy lines; leave it all alone," and live or die in the determination to preserve intact the west front of St. Mark's.

Precisely so, Messrs. Ewan Christian and George Edmund Street; and is not that desire to pressure intact the Church of St. Mark as dominant in Venetian architects as in yourselves? And if not, are you to dictate to foreign governments and foreign architects as to the necessity or otherwise of taking precautions to uphold, alter, restore, or rebuild any particular structure they may desire should be so dealt with? Are your views, even with the aid of powerful glasses, to be thrust upon other countries, as to whether a building stated to be unstable by local architects employed for the purpose, is, or is not, in want of attention? Is it because you choose to take under your protection "wavy lines," "small pieces," "irregular work," and other funny things in that jumbled up west front, with columns having bad capitals carrying nothing, with a balcony as incongruous as it could be, with proportions and details as offensive as possible, and all intermixed with silly sculpture, that you ask members of the Institute to help you in your indelicate work? Would English architects like French architects, after visiting London, to go back and write insane letters to the *Times* about matters which properly are and should be left to English architects? Could not a man just returned from the London Law Courts address his Venetian brethren, and pray that the attention of the English Government should be called to the many things there, inside and outside, which, in his opinion, should be altered, and the works in progress stopped? Could he not ask why that piece of circular insipidity at the corner of the Northumberland-avenue was allowed to be erected; and could not somebody say, "Because it was to help Drummond's Bank"? And what about the best sites at the west of London being covered with pieces of embodied ugliness called Queen Anne architecture? What about some scores of other buildings which might be named, wretched responses to wretched fashion? What about so-called fine art in the drawing-room, such a "corner" as that recently illustrated as the work of Mr. Edis—another example of faddy-fashion? I suppose any circular on these little matters issued by a foreign institute would be considered impertinent by London architects; and if Mr. Christian is so fond of "wavy lines" and "small pieces," why does he not execute them in his buildings? That building of his in Bridge-street, Blackfriars (which, I am sure, we all admire), is not absolutely covered with wavy lines, and the stones are very much bedded and jointed, as customary; then let practice follow precept. I don't know that much more can be done in the way of "bits" at the Law Courts; but perhaps we can have them in other works.

I conclude, Sir, with the earnest wish that the members of the Institute will abstain from committing themselves to any protest, circular or otherwise, which would convey imputations that our Venetian brethren are incompetent, and that when they report that St. Mark's is in need of reparation, restoration, or rebuilding in parts, they so report in order to get a job, and that the only man who really knows what is required is Mr. George Edmund Street. As a member of the Institute, I should not dare to become a party to so insolent a piece of meddling; and I hope that members will show their disapprobation of the whole affair by withholding their signatures from any circular which may be sent to them.—I am, &c.,

January 4. WM. WOODWARD.

Intercommunication.

QUESTIONS.

[6345.]—**Surveyor's Charges.**—What are the fair and customary charges for taking out quantities and making estimate, from architect's drawings and specification, for a builder, when his tender is accepted? Also, what is a fair charge for making an estimate, when the architect or his surveyor supplies quantities, to the builder, if his tender be accepted? I am often called on to take out quantities and make estimates for builders, taking no risk nor being responsible for accuracy. I do not know what is a fair charge for so doing. If I charge 2½ per cent. when the builder is successful I am told it is too much, and am offered 1 per cent., which I think is too little. Will some builder's surveyor give me his opinion?—QUANTITY SURVEYOR.

[6346.]—**Landscape Gardening.**—If any reader could give the name of a small work on the above it would greatly oblige.—OVAL.

[6347.]—**Perspective Drawing.**—Which is the best book treating on the above in its application to the requirements of architecture?—H. K. A.

[6348.]—**Organ in Trinity College Chapel, Dublin.**—Will some reader kindly give specification and brief description of this instrument?—INQUIRER.

[6349.]—**Violin.**—Inside one which cost a friend £25 more than half a century ago is "Ignatio Bentze in Italia a Croemona." Any information regarding this maker or his merits will be welcomed by—INQUIRER.

[6350.]—**Surveying.**—Will some reader oblige by answering the following:—A field is separated from a country high road by the usual hedge and ditch, the ditch on the road side. Would the centre of the hedge be the boundary line?—Z. Y. X.

[6351.]—**Openings.**—Having just completed a large job where openings are not deducted, the proprietor objects to allow me to take the following opening, 22 by 20, for stage. The walls to opening are plastered on both sides, and from stage to floor 5ft. The room is 86 by 34, and 26ft. high; also in corridor, 100ft. by 15ft., he objects to the following openings being taken: 6ft. by 37ft., also 12ft. by 6ft., also 8ft. by 22ft., also 13ft. by 10ft. Will you kindly insert this in your valuable paper, as myself and proprietor and architect have agreed to accept the answer given therein.—ROMBALD.

[6352.]—**Wall.**—To what height would it be necessary to build a 9in. brick wall, 15ft. long, before the superstructural weight would crush the bottom course of brickwork, supposing it could be done? I have an argument about this, and should be thankful for any information, the kind of bricks used being kiln.—LEO.

[6353.]—**Orientation.**—Apropos of your article in last week's BUILDING NEWS on "Orientation," have any of your readers noticed (1) how far the private chapels attached to the old manor-houses in various parts of the country orientate? (2) Also if the manor houses themselves commonly follow the points of the compass. Some instances in Lancashire and Cheshire have been pointed out in "Notes on Sketching Tours," recently published by Batsford. Can instances be quoted in other parts of the country?—J. M. G.

REPLIES.

[6343.]—**Water Tests.**—The fundamental principle of the ordinary method of ascertaining the relative hardness of water is the fact that hard waters require more soap to form a lather than soft ones. A measured quantity, therefore, say, 70 cubic centimetres of the water in question is put into a stoppered bottle which has been carefully rinsed with distilled water, and an alcoholic solution of soap of exactly known strength is added from a graduated glass measure called a burette, until the mixture, on shaking up, forms all over its surface a lather which will last for five minutes. The quantity of soap solution added is then read off, and the hardness of the water can be calculated from the amount of soap used. The hardness of water is due to the decomposition of soap by certain salts of lime and magnesia held in solusolution, and as a fixed quantity of soap is decomposed by a fixed quantity of these salts, the more of them a water contains the more soap is decomposed before any can dissolve and remain unacted upon so as to produce a good lather. The number of measures of soap solution used by a gallon of a water is its number of degrees of hardness. Seventy cubic centimetres of water weigh 70,0.0 milligrammes, and one gallon weighs 70,000 grains, therefore 70 cubic centimetres may be considered a miniature gallon, and it is a convenient quantity to take, as a gallon would be too bulky to work with. Professor Wanklyn recommends that the solution of soap should be made of such a strength that one cubic centimeter will contain just enough soap to be acted on by one milligram of carbonate of lime. This is done by dissolving 10 grammes of Castile soap in one litre of weak alcohol, of about 35 per cent. in strength. All the soap must be dissolved, and the solution well shaken up. Now, if 70 cubic centimetres of a water took 5 cubic centimetres of this "soap test" it would have 5 degrees of hardness, 70 cubic centimetres of another water taking 8 cubic centimetres of the soap solution would indicate 8 degrees of hardness, and so on. The foregoing is a partial outline of the process for determining hardness given in Wanklyn's "Water Adalysis," but as I dare not take up too much space, the outline here given makes no mention of the various practical details of the method. With regard to the second question of "Juventus," I may safely say that there are no really simple and, at the same time, reliable tests as to whether any particular water is fit or unfit for human consumption. To quite satisfactorily solve such a problem necessitates the employment of many and difficult scientific processes which can only be carried out by those who have had long training in analytical chemistry. The quantity of foreign matter present even in waters which may be most deadly in their effects on the animal system is so minute that water analysis constitutes one of the most delicate and difficult branches of chemical science, and cannot yet be said to be in a thoroughly satisfactory condition. The greatest chemists have differed and do differ on the respective merits of the best processes at our command, and it is very obvious that if there were any good and simple test of the kind asked for by "Juventus," the complicated processes, expensive apparatus, and voluminous literature connected with water analysis would be useless, and without any raison d'être. The third question can be more easily answered. Iron, lead, and copper, if present in water, even in minute quantities, may be easily tested for by adding a few drops of ammonium sulphide solution to about 100 cubic centimetres of the water, which should be in a white porcelain dish or bason If a brown or black colouration is produced which does not disappear on the addition of a drop of pure hydrochloric acid, either lead or copper is present, and the water should be absolutely condemned. If the colouration disappears on the addition of the acid, it is due to iron, and in this case, supposing the colour to have been originally only just visible, no notice need be taken, as a trace of iron is for most purposes unimportant. There is no special test for urine, but the presence of a large amount of free ammonia in water is, to a great extent, indicative of urinous (especially) and other organic contamination, and the best test for ammonia is that called Nessler's test, which, on being added to a water containing much free ammonia, would impart a sherry-coloured tint, or, if the contamination were excessive, a brown precipitate. The water-testing apparatus at a guinea and half a guinea, sold by the London and General Purifying Company, 157, Strand, W.C., contains simple tests, with directions, for the most usual impurities in water, and, as far as it goes, would probably meet the requirements of "Juventus." By its aid he could condemn any thoroughly bad waters, but I cannot too strongly urge that, as regards the vast majority of waters one meets with, no process short of a regular analysis would quite reliably enable one to decide upon their safeness or the reverse.—EDWY G. CLAYTON, Analytical Chemist and Assoc. Socy. Public Analysts.

CHIPS.

At the Lancashire Quarter Sessions, held on Thursday week, the sums of £20,500, £11,000, and £8,850 were voted for the erection of a new annexe at the several lunatic asylums at Whittingham, Prestwich, and Lancaster respectively, and £12,000 for the purchase of a site in Islington-flags, Liverpool, for the erection thereon of a sessional court-house for that city.

Two of the works which were contributed to the present exhibition at the Grosvenor Gallery, have been purchased by the South Kensington Museum for the nation.

The Institution of Civil Engineers, which was established for the promotion of mechanical science, has just entered upon its sixty-fourth year. According to a list corrected to the 2nd inst., it now numbers 3.839 of all classes, distributed thus:—members, 1,231; associate members, 1,335; associates, 569; honorary members, 18: and students, 686.

A new coffee-tavern, in the High-street, Deptford, belonging to the United Kingdom Coffee-Taverns Co., was opened on Thursday week.

The cap-stone of the spire of Christ Church, Leeson-park, Dublin, was laid by the Rev. Dr. Neligan, on Wednesday week. The church was built between 1859 and 1863, with the exception of the spire, from the designs of Mr. Rawson Carroll. The new tower has a belfry in the upper stage, with four double-light windows with pointed and cusped heads; at present it contains no bells. Over this is a broach spire having a range of lucerne lights, and above these quatrefoil perforations, and the total height from ground to copper terminal is 150ft. The materials are chiselled Ballyknocken granite, and limestone dressings. Mr. Rawson Carroll was the architect, and Mr. Bolton the contractor.

The Devonport borough prison has been sold to Mr. John Martin, builder, for £5,500.

LEGAL INTELLIGENCE.

THE DANGEROUS CHIMNEY AT THE CRITERION.—On Wednesday the dispute about the degree of stability of the Criterion chimney-stalk again occupied the magistrate at the Marlborough-street police-court. Mr. Cooke was on the bench, and showed some reluctance to adjudicate in a case with which Mr. Newton had previously dealt; but on it being admitted by both parties that Mr. Newton's order could not be carried out, as it was against the builder of the chimney, out of whose hands the building had completely passed, Mr. Cooke consented to hear and decide upon the case on its merits. Mr. Napier appeared for the Board of Works, and Mr. Bigham (barrister) for Messrs. Spiers and Pond. The argument of the summons was "to take down the new chimney-stalk on the building to the extent of four feet on the top thereof; or, otherwise, to stay and support the said chimney-stalk (leaving it at its present height) by means of an additional stay of H iron, nine inches deep, properly secured at the foot, and attached to the chimney-stalk at the head by a proper iron stretcher." Mr. Robert Kerr, district surveyor of St. James, said this chimney was erected in May, 1879, without notice being given to him. An application was promised by the builder to the Metropolitan Board of Works for its sanction, but it was not made. In October, 1879, notice was given by the district surveyor to have the work amended. Nothing was done. In November of that year there was a summons of the builder to the police court, with its adjournments. In January, 1880, the case was heard before Mr. Mansfield, and referred to the Metropolitan Board of Works. Doubts were felt as to the Criterion being a public building, and, therefore, as to the applicability of the Act. Mr. Mansfield decided this affirmatively. In May, 1880, the Metropolitan Board of works decided that an iron stay should be put up. In June there was a notice given by the district surveyor to the builder to amend his work according to this decision. It was not amended. In July there was a second summons to the police-court. One case was adjourned *sine die* by consent. The other was heard by Mr. Newton, and an order was made in terms of the Metropolitan Board's decision. In August the written order was delivered by the police. Mr. Verity, the architect, told the district surveyor he would not obey it. On Nov. 27, an information was laid by the district surveyor that this chimney was a dangerous structure. On December 1 it was condemned as dangerous, and hence the summons (No. 3) to the police-court. The Building Act, Section 20, sub-section 10, implied the danger, and so did the decisions of the Metropolitan Board, after an exhaustive hearing of the case, and the decision of Mr. Newton. He (Mr. Kerr) had repeatedly examined the chimney, and he pronounced it to be a dangerous structure in respect of its excessive height. It was four or five feet higher than it should be by statute, and was only supported by four strings of copper rope. He had had no end of trouble over it. As he had indicated, it had been in this court about 19 times. The statutory height of a chimney was six times the width in a private building. This was a public building, but he could not conceive that the legislature of this country would lay down a rule for the height of a chimney attached to an ordinary dwelling-house and allow it to be disregarded in regard to a public building. Mr. Kerr added that the width of this chimney was 4ft., and its height should consequently be 24ft. He had got an order upon the builder to take it down to 24ft. above the roof, but had taken no steps to put it in force, as he found the builder had no longer any power in the matter. The brickwork of the chimney was built round iron pipes, and could not therefore be as stable as ordinary work. In cross-examination, Mr. Kerr admitted that when he received on the 30th November an order from the Board of Works to survey and report on this chimney, he did not make a close survey from the roof of the Criterion before sending in his report; but he explained that the reason of this was that he had several times previously made a very close survey, and knew, on Dec. 1st, by merely looking at the chimney, that it was in the same condition as he had before found fault with. Mr. Robert Walker said he was district surveyor on the other side of the Haymarket. He had seen the chimney-stalk in question, and he agreed with the last witness in considering it to be a dangerous structure. Cross-examined, he said he had seen the chimney-stalk from the roofs of adjacent buildings. Asked why he regarded it so intently, as now to be able to volunteer evidence about it; he said the chimney was a matter of notoriety amongst the architects of the metropolis. The Grand Hotel, at Charing Cross, had built one like it, but had been compelled to take it down 15ft. Being asked if his readiness in volunteering evidence adverse to Mr. Verity, the architect of this building, did not arise from his unsuccessful attempts against the owners of other buildings erected by that gentleman, he said he had never taken proceedings against Mr. Verity in his life, and indeed he had never taken proceedings against anybody which were unsuccessful. Mr. Bigham then addressed the Court, contending that the preliminary steps necessary to secure the hearing of this case had not been taken. This application was made under sections 69 to 74 of the Building Act, and they provided that whenever it was made known to the commissioners under it that any structure was in a dangerous state, such commissioners should require a survey to be made by the district surveyor, and that it should be the duty of the district surveyor to make known to the commissioners any information he might receive in regard to any structure. He submitted that Mr. Kerr had not made a survey within the meaning of the Act between the date (Nov. 30) of receiving the order to survey the chimney and the date (Dec. 1) of writing his report on it. Mr. Cooke remarked that the Act was clear on the point that the information must be made to the commissioners, and then the commissioners ordered a survey. Mr. Bigham said the first document was the information given by Mr. Kerr, and the second the requisition by the board to Mr. Kerr to make a survey. The next document was the survey; but in this case it was proved that there had been no survey in obedience to the requisition. Mr. Cooke said he would take it that a survey had been made. Mr. Bigham: Between Nov. 30 and Dec. 1? Mr. Cooke: Yes; there was a certificate before him that Mr. Carr had made it and he received the certificate. Mr. Bigham pointed out that Mr. Kerr had admitted that it was probable he had not made a close survey at that time, giving, as his reason, that he had seen the place frequently before. Between 30th Nov. and 1st Dec., if he looked at the chimney at all it was only from the ground. Though the chimney was now in the same condition as it was in 1879, the district surveyor thought it so little of a dangerous structure that he had allowed it to remain more than a year before he took proceedings under that portion of the Act which related to dangerous structures. He (Mr. Bigham) held that there had been no survey at all. Mr. Cooke ruled that there had been a survey, saying that he had a certificate to that effect before him, and that it was not his duty to inquire how the district surveyor had made it. Mr. Bigham's proper course was to call evidence, if he had any, to show that the district surveyor had made some mistake about it. If he showed that then it would have some weight with him. Mr. Verity, the architect of the Criterion, was then called. He said the main building was erected in 1873, and what was called the Annex, of which this chimney was a part, in 1879. The greater part of the heat from the premises below was conducted up a flue which had no connection with the chimney-stalk. The chimney was in no danger from a high wind. The guy-ropes were put up twelve months ago because the district surveyor was so uneasy about the chimney. In reply to Mr. Cooke, the witness admitted that the chimney was 3½ft. higher than the statute would allow in a private building; but the Criterion was a public building. Being asked how, if such a height of chimney constituted a dangerous structure in a private building, the same thing was not dangerous in a public one, he said it did not follow that because the statute prescribed a certain height it was dangerous to go higher. In reply to Mr. Bigham, he said the part of the Act which had reference to private buildings contemplated appearance as well as safety. Mr. Woodthorpe, a district surveyor, who made some demur against being examined at all, as he must express an opinion against his employers, the Metropolitan Board, said, at last, that he had surveyed the chimney, and could not term it a dangerous structure. He admitted that it would be better if a few feet were taken off it, and thought that the defendants ought to attend to the orders of the Board and the magistrates in this. Mr. Harvey, architect, declared that it was impossible to make a satisfactory survey of this chimney from an adjoining roof. He had made a close survey of it, and there was no reason whatever for suggesting that it was a dangerous structure. Mr. Cooke recognised that the Criterion was a public building, inasmuch as there was a theatre in it. It seemed to him that there should be something done in regard to this chimney. The certificate spoke of it as a dangerous structure, and the summons called upon the owner to either reduce the height by four feet or to give it some further support. These proceedings seemed to have been going on for more than a year. He could not understand why the matter might not have been settled in a satisfactory way without all this litigation. He feared that some feeling had been introduced into the case. It was in the public good that some reduction should be made in the height of the chimney or some other support given to it. What guided him very much in coming to this decision was that the first portion of the Act fixed the height 3½ft., at all events below the height of this chimney, even on the admission of Mr. Verity. The learned counsel, who saw the effect of the admission, asked him if the Act did not apply to the appearance as well as to the safety of the buildings. [He (Mr. Cooke) hardly thought that appearance was much considered in dealing with chimneys. When the Act fixed the maximum height of a chimney, there must be good and sufficient reason for doing so. If there had never been any other examination than the last one made by Mr. Kerr, he would have certainly rejected his report; but it appeared that Mr. Kerr was perfectly conversant with the chimney, and if he made an apparently superficial examination on the last occasion, he had made thorough examinations of it before. He (Mr. Cooke) therefore made an order, in terms of the summons, to be executed within a month.

CHIPS.

New board-schools, masters' residence, &c., Wheatley Hill, Durham, were opened on Wednesday week. They have been built by Mr. J. Perks, contractor, Stockton-on-Tees, from designs and under the supervision of Messrs. Weatherill and Moses, Stockton-on-Tees, architects to the board.

The whole of the facing bricks, rubbers, also the moulded bricks and the tiles for the roof for Westwood House, Sydenham, illustrated by us on Dec. 24th, were supplied by Mr. T. Lawrence, of Bracknell, Berks. The facing bricks are his picked hand-pressed; the moulded bricks were made specially for this job, and so were the tiles, and the carved work is done with rubber bricks.

A stained-glass memorial-window has just been placed at the east end of St. John's Church, Deptford. The centre contains a full-length figure of the patron saint, and beneath he is represented in the Isle of Patmos receiving the Book from the Angel. On the left are representations of the parables of the Talents and the Good Samaritan, and on the right the parables of the Ten Virgins, and the Prodigal Son.

The Dundee town council last week had under consideration the plans and Bill for the new Tay-bridge. They decided to recommend Parliament to make the height of the bridge 40ft. above high-water level instead of 77ft., as proposed in the Bill, and will take steps to secure the co-operation of the burghs interested in seeing that the new structure is a thoroughly substantial one to attain the object in view.

Foundation-stones of Saron Welsh Congregational Chapel were laid at Nant, near Minera, on the 14th ult.

A large building, recently erected at Bohemia, Hastings, for the members of St. Paul's Working Men's Club, was opened on Wednesday week. Mr. W. J. Gant was the architect, and Messrs. Russell were the builders.

Mr. John M'Crae, at present superintendent of the gasworks at Bury St. Edmund's, has been appointed manager of the Dundee gasworks, in succession to his father, Mr. Boyd M. M'Crae, deceased.

A cottage hospital, erected at Keith, N.B., as a memorial of the late Dr. Turner, was opened on Friday last. It has been erected at a cost of £1,500, including furnishing. The architect was Mr. Robertson.

The bells of Dawlish-church have been rehung, and new chiming apparatus provided, by Mr. Aggett, of Chagford.

The corporation of Rochester have obtained the sanction of the Local Government Board to borrow £3,219, to be repaid in 15 years, and of £1,590, to be repaid in 5 years, for paving and channeling the streets in the outlying districts of the city.

Alderman George Moyers, LL.D., who was sworn in as Lord Mayor of Dublin, on New Year's Day, is a builder in extensive business at Portobello, a southern suburb of that city.

The new Skeldergate-bridge, at York, was opened to foot-passengers on New Year's Day, and will soon be available for wheel traffic. It was built at a cost, for bridge and apparatus, of between £40,000 and £50,000. It is of iron, in three spans, one of 90ft., and two side ones of 30ft. each, one of the latter, that next the city, opening to allow of the passage of masted vessels. There are also two land arches of 24ft. span each. The consulting engineer was Mr. George Gordon Page, C.E., of London, and the resident engineer, Mr. R. Munn, who acted in conjunction with Mr. Hyan, city surveyor. Messrs. Handyside and Co., Derby, supplied the ironwork, and Sir William Armstrong and Co. provided the hydraulic machinery, by which the machinery of the bascule-bridge is moved. We illustrated the original design by a perspective and detail drawings on May 24, 1878, and the amended design by a perspective on June 25, 1880.

Our Office Table.

A REPORT has oozed out from the inquiry which Lord Derby and his colleagues are now prosecuting, to the effect that in 12 years the trust property of the City Companies or Guilds has increased upwards of £100,000 a year. It may be observed that this is a fact which intimately concerns the arts and industries. From it we learn that if for the promotion of technical education we had but the increment of the last dozen years, we should have an income of £100,000 a year, and if this splendid sum is compared with the income which these Guilds have voluntarily contributed to the proposed Technical College at South Kensington, it will be seen how large is the difference between what they propose to do and what they ought to do.

MR. HENRY R. WORTHINGTON, one of the most prominent hydraulic engineers in America, died Dec. 17, 1880, at New York, after a very brief illness, at the age of 63 years. Mr. Worthington was a native of Brooklyn. He engaged in mechanical pursuits at an early age, and became a hydraulic engineer while a very young man. His success in his profession was marked, and he invented a number of important improvements in hydraulic machinery. He constructed the pumping machinery for the waterworks of a great many cities, including that for the new high-service works at 97th-street, and Tenth-avenue. He maintained an office at No. 239, Broadway, and was also President of the Nason Manufacturing Company. He was Vice President of the American Society of Mechanical Engineers, which he assisted to found, and was a member of the Society of Civil Engineers.

THE REV. FREDERICK JAMES JOBSON, D.D., who was president of the Wesleyan Conference in 1869, and for many years chief at the Conference office, died on Tuesday moring. He was seized with paralysis on Christmas-eve. He was born at Lincoln in 1812, and articled to Mr. Willson, F.S.A., an architect of that city. He became a minister in 1834, and filled some of the most important posts in the Methodist body, having been officially connected with chapel building and schools for minister's sons, the theological institution, the relief and extension funds, and day-school education, and acted as clerical treasurer for the Foreign Missionary Society. In 1869 he was elected president of the Wesleyan Conference for the ensuing year. In addition to several devotional works which attained success in Methodist literature, Dr. Jobson published "Chapel and School Architecture as Appropriate to the Buildings of Nonconformists," 1850; "America and American Methodism," 1857; and "Australia, with Notes by the Way on Egypt, Ceylon, Bombay, and the Holy Land, 1862."

A COMMUNICATION on the subject of Boulder Stones as Gravestones was read at the last meeting of the Manchester Literary and Philosophical Society by Mr. E. W. Binney, the president. Mr. Binney said that in the numerous excavations made in the drift deposits large boulder stones are often met with, and cause a good deal of trouble to the workmen. They are glad to get quit of them somehow or other. Blasting them with gunpowder or dynamite, or burying them near to the place where they have been found, have been generally employed. Latterly it has become the fashion to remove them to public parks in order to preserve them; and fine specimens may be seen in those places at Manchester, Salford, Oldham, and Macclesfield, where they are not only preserved, but exposed to public attention. He (the president), when visiting Ashton-under-Lyne the other day, observed another use to which boulder stones had been applied. There in the churchyard in the Manchester-road a greenstone boulder, instead of being buried as was formerly the custom, is now used as a tombstone over the grave of a son of an Alderman of that borough. This is the first instance where he had seen a boulder stone used for such a purpose, and it is one where they may not only be preserved, but exhibited to the public. Over the grave of the late Mr. Locke, the railway engineer, in Kensal Green Cemetery, is a block of red granite, but although plain, he thinks it is not a boulder like the one at Ashton-under-Lyne.

IF a man wants to build a wall or a house in Cyprus, according to the *St. James's Gazette*, he begins by making a hole in his garden. Shovelling up and sifting the earth, he adds chopped straw; his wife helps and throws water on the mixture, which is worked up until it is thick enough to form into flat slabs. These are moulded with the hands, with or without the help of a rough wooden frame. It is not without significance as to the low value put upon labour, and the perfectly rudimentary state in which some of the crafts of this old island still remain, that the masons may be seen working mortar with the hands, and so carrying it up a ladder, or placing it on the stones without the aid of hod or trowel. The thick walls built of the mud slabs and the flat mud roofs form an admirable sun-fence; but no sooner are they erected than sun, wind, and rain, all violent of their kind, commence a rapid course of destruction; and, as repairs are seldom undertaken, most of the small houses and their enclosures have already become, or are, in the perfectly accurate language of Job, ready to become, heaps. The "ruinous heaps" an dilapidated walls are washed by the torrents, and encumber the uneven, up and down tortuous lanes and alleys with dirt and dust. In a thunderstorm in November, 1880, five houses together were resolved into their native elements in Limasol. The aspect of such a town or village is of one uniform dead hue of mud, and must be seen in order to fully understand the "beating down" and the "merciless ploughing" of the ancient conquerer, and the sowing of "barren salt" over the ruins of a "fenced city."

THE death is announced, at the age of 79, of Mr. John Parker, of Wycombe, an antiquary of great local reputation. Mr. Parker's chief work was his "Early History and Antiquities of Wycombe," which was published by subscription in 1878. The preparations for this book, which displays great learning and research, occupied the greater part of Mr. Parker's latter years. The subject was congenial to him, and, from the antiquity and many historical associations of the borough of Wycombe, more interesting to the outside public than the books of antiquaries are wont to be. Mr. Parker was by profession a solicitor, and was at one time town clerk and for many years clerk to the borough magistrates at Wycombe.

LAST week the Duke of Portland gave a supper to abont 80 of the workmen employed at Welbeck, who have been working for months past on the restoration of the Abbey. Mr. Tinker, the clerk of works, proposed the health of the Duke of Portland, coupled with Lady Bolsover and the other members of the family. The Duke responding, proposed the health of Mr. Tinker, coupled with the names of Mr. Collingham and Mr. John Stubbings, for whom all gave three hearty cheers. The company afterwards drank the health of Mr. Turner, agent, and Mr. M'Callum, steward; and having spent a very pleasant evening, broke up about 10 o'clock.

MR. G. F. ANSELL, the inventor of the firedamp indicator, who died on the 21st ult., has recently applied the principle of that apparatus to the production of an instrument for the detection of gas leaks. The action of Mr. Ansell's firedamp indicator is founded on the fact, that different gases have different rates of diffusion through a porous body, the velocities of diffusion being inversely as the square roots of the respective densities of the gases. In the gas leak indicator, this property is taken advantage of as follows:—A small chamber is provided, having its back formed by a disc of terra-cotta, this chamber being provided with a small stop-cock, by which its interior can be placed in communication with the outer air. If, when this stop-cock is closed, the indicator be taken into a room where a gas leakage exists, the gas, in virtue of the above named law of diffusion, enters the chamber through the terra-cotta disc more rapidly than the enclosed air escapes, and the pressure in the chamber consequently rises. This increase of pressure is utilised to move a hand on a dial at the front of the instrument, each pressure corresponding to a certain percentage of gas in the atmosphere in which the indicator is placed. The dial is graduated from 0, to 35 per cent. of gas, and is moreover marked to show when the mixture is, and is not explosive.

ABOUT six months ago, Messrs. Tangye, engineers, of Birmingham, offered to subscribe a sum of £10,000 towards the erection of an Art Gallery, on condition that the Town Council would vote for the erection of the Art Gallery and an Industrial Museum, and that a further sum of £5,000 was obtained by public subscription. On Tuesday at the meeting of the Council, it was announced that a sum of £6,500 had been subscribed or promised. The Council, who had previously given their sanction for the establishment of an Art Gallery, passed a vote of thanks to Messrs. Tangye for their munificent gift. The Art Gallery will be situated in the Council-house, and already many presents of valuable works of art have been made.

To make shoe-pegs enough for American use consumes annually 100,000 cords of timber, and to make the lucifer matches, 300,000 cubic feet of the best pine are required every year. Lasts and boot-trees take 500,000 cords of birch, beech, and maple, and the handles of tools 500,000 more. The baking of bricks consumes 2,000,000 cords of wood, or what would cover with forest about 50,000 acres of land. Telegraph poles already up represent 800,000 trees, and their annual repair consumes about 300,000 more. The ties for railroads consume annually thirty years' growth of 75,000 acres, and to fence the railroad would cost 45,000,000dols., with a yearly expenditure of 15,000,000dols. for repairs. These are some of the ways in which American forest are going. There are others; packing boxes, for instance, cost, in 1874, 12,000,000dols. while the timber used each year in making wagons and agricultural implements is valued at more than 100,000,000dols.

A MEETING is to be held this afternoon at the Mansion House, at 3 p.m., under the presidency of the Right Hon. the Lord Mayor, to consider the present smoky condition of the atmosphere of London, which injuriously affects the health and happiness of the community, beside destroying public buildings, deteriorating perishable fabrics, and entailing in various ways unnecessary expenditure, and promote the best means of remedying this evil. The Joint Committee of the National Health and Kyrle Societies have arranged, by permission of Her Majesty's Commissioners for the Exhibition of 1851, of the Lords of the Committee of Council on Education, and of the Council of the Royal Horticultural Society, to hold an exhibition (open to Foreign as well as British competition) in the buildings erected for the International Exhibition of 1862, of the various smokeless coals and other fuels, and of various appliances applicable to household and manufacturing purposes for the reduction of smoke, and to test the same, in order to demonstrate for public information the means practicably available to secure that object. The Committee are of opinion that such investigation and testing should precede any application for amendment of the existing smoke acts, or for new legislation in regard to smoke from dwelling houses. Resolutions will be proposed in furtherance of these objects.

A CORRESPONDENT of the *West Sussex Gazette* writes: The intelligence of the decease of the Rev. Mackenzie E. C. Walcott will be received with great regret by those who knew him. Appointed to the Precentorship by Bishop Gilbert, on the death of Dr. Rowden, he soon created a circle of friends by his kindness, courtesy, and varied talents. In addition to his fine voice and love of music, he was an eloquent extempore preacher, whose sermons always riveted attention. He immediately interested himself in the history and antiquities of Sussex, and thought no amount of research too great as to the archæology of Chichester and its neighbourhood. His "Memorials of Chichester," published in 1865, and "History of the Bishops of Chichester, from Stigand to Sherborne," in the collections of the Sussex Archæological Society, are evidences of his unwearying industry. In kindred pursuits Precentor Walcott was ever ready to aid coadjutors, both with his pen and with his facile pencil. His knowledge of heraldry was accurate, and few could decipher mediæval MSS. with equal ease. Amongst his many works, may be specially mentioned "Cathedralia," "The English Ordinal," "Interior of a Gothic Minster," and "William of Wykeham and his Colleges." The latter, written thoroughly *con amore*, and as illustrating the scenes in which he delighted in his boyhood, is perhaps his best production. As that of a scholar of high culture, refined taste, and pleasant manner, the death of Precentor Walcott is a loss to West Sussex much to be deplored. The same journal, in mentioning that Mr. Walcott became Pre-

bendary of Oving and Precentor of Chichester in 1863, explains that the precentor ranks in the cathedral next after the dean; but that it is at Chichester purely an honorary dignity, the duties which usually fall to the precentor being at Chichester discharged by the Succentor.

PART IX. of "Gloucestershire Notes and Queries" edited by Rev. B. H. Blacker, M.A., contains as usual, a variety of matter of special interest to the antiquary. On p. 295 is a quotation on the Source of the Thames, from which it appears that the cabmen of Cheltenham, anxious for the custom of visitors, "are fain to represent that the head of the Thames is to be found within a five-miles drive of that town at a place called 'Seven Springs,' in the parish of Cubberley." But this source is the head of a tributary stream, known by the name of Churn, as shown by Leland's remarks. In note cccxiv., mention is made of a paper, illustrated, on "Architectural Notes in the Neighbourhood of Cheltenham," in the *Archæological Journal*, Vol. IV., by J. L. Petit, the well-known architectural critic and author of "Notes on Continental Architecture." The quotation given is apropos; Mr. Petit therein directs attention of the antiquary who may visit Cheltenham to the village churches within his reach, where curious architectural features and valuable specimens of decoration, painted glass, tiles, woodwork, &c., will amply reward research. Following, is a quotation from the the Rev. H. Hayman's "Historical Memories and Tewkesbury Abbey" in the *Antiquary* of March last, in which the writer conjectures the opinion that the large window recess once had a group of Norman lancet windows, and appeals to the Freemasons of the kingdom, for help to restore the west front. What will the S.P.A.M. say to the suggestion? Among other interesting matter, we find something on the largest oak in Britain, extracts from parish registers of Cheltenham and Tetbury, indices to monumental inscriptions, and some gleanings about Colston's House at Mortlake.

CHIPS.

A stained-glass window has just been placed in the north aisle of St. Andrew's Church, Plymouth, in memory of Mr. John Kelly. It is fifteenth-century in style, and the lights are devoted to large single-figure emblematic illustrations of Abraham represented as bearing the knife in his hand, Isaac with a bundle of wood, Moses and the Tables of the Law, David a harp, Solomon the Temple, John the Baptist the Lamb and Staff, John the Evangelist a book and pen, Peter the keys, and Paul a sword and book. The tracery contains figures of angels with emblems. Messrs. Fouracre and Watson, of Stonehouse, executed the work.

The local board of Teignmouth received, on Tuesday week, sixteen applications for the post of surveyor rendered vacant by the resignation of Mr. Turner. Six of these were considered:—Mr. R. Evans, Chepstow, who asked £200 a year as salary; Mr. W. Poulson, Stoke-on-Trent, £200; Mr. Thomas Blewitt, C.E., Birmingham, £180; Mr. Thomas Caink, Great Malvern, £164; Mr. J. I. R. Dodd, Sheffield, £150; and Mr. R. Valentine, builder, Teignmouth, £100. On the vote being taken, Messrs. Caink and Valentine received an equal number, and the chairman gave a casting vote in favour of Mr. Caink.

The workmen of Mr. George Jamieson, builder, of Woodside, Aberdeen, held a supper and ball in their large workshop last week in celebration of their employers' marriage. At the supper, Mr. Rust, junr., architect, of Aberdeen, occupied the chair.

Mr. Robert King, of Bridge Wharf, Kingsland-road, has taken into partnership his nephew Mr. Walter Scarborough, and the business will henceforth be carried on under the name of King and Scarborough.

The east window of St. Nicholas Church, Saltash, has just been filled with stained-glass, the work of Mr. Gibbs, of Bloomsbury-street, London. It comprises five subjects:—"Behold the Man," "Jesus Bearing the Cross," "It is Finished," "They laid Him in a Sepulchre," and "Touch Me Not."

The *Church Times*, in an obituary notice of the late Rev. G. D. Tinling, of St. Clement's, Bournemouth, second son of Canon Tinling, of Gloucester, mentions that after leaving Oxford, Mr. Tinling spent a year in Sir Gilbert Scott's office, and, at its expiration, took priest's orders.

The foundation-stone of Dalmamock Established Church, at Bridgeton, near Glasgow, was laid on Monday. Messrs. A. Galbraith and Co. are the builders, and the cost will be about £3,500.

A new Independent chapel, to be known as Zoar, is about to be built at Clydach Vale, near Pontypridd. Mr. J. Rees, of Pentre, is the architect.

St. Jude's mission-room, in Lamb-street, Bristol, was opened on Monday. It is built of stone, with free stone dressings, and consists of two floors, on each of which is a room 25ft. by 18ft., and several smaller apartments. Mr. W. Church was the contractor, and the work has been carried out under the superintendence of Mr. Saunders, also of Bristol, at a cost of £600.

The prizes and certificates gained by students in the science and art classes at Cardiff were distributed by Sir E. J. Reed, M.P., on Monday evening. The report stated that there had been, during the past year, an increase both in the number of students and in the prizes and certificates taken.

Mr. William Wilson, late assistant in the Dundee school of art, was presented on the 30th ult., with several books on art, and a gold albert, by the teachers and students, on the occasion of his leaving Dundee to take the post of master of the Kirkcaldy school of art.

A stained-glass window is about to be erected in St. John the Baptist's Chapel, Westminster Abbey, in remembrance of Dr. Livingstone. The principal subject will be a figure of St. John the Baptist preaching in the Wilderness, and in a lower panel will be shown St. Philip baptising the Ethiopian eunuch. The artist is Mr. W. F. Dixon, of the firm of Dixon and Vesey, London.

The parish-church of Dunmow, Essex, has just been lighted with gas; there are three suspended central gaseliers over the nave, and one in the chancel, as well as three lights and brackets in nave, and two open-worked brass standards of 20 lights each, at east end of nave. The work has been carried out by contract by Mr. John Young, of Dunmow.

An infectious diseases hospital is about to be built at Keycol-hill, Sittingbourne, for the improvement commissioners of that town. Mr. W. L. Grant is the architect, and the cost will be £5,000.

The local board of Long Eaton, near Trent Junction, last week adopted plans for the drainage of the district, prepared by Mr. Sheldon, the surveyor, and estimated to cost, in execution, £2,000.

The newly-constructed "light" line of railway from Swindon to Highworth was opened on Tuesday week by a trial trip from Swindon, and a dinner at the terminus, given by the contractor, Mr. James Hinton, to the promoters of the line. There are intermediate stations at Stratton, Stanton, and Hannington. Mr. Robertson was the engineer.

An inquiry was held at Eastbourne on Wednesday week, before Mr. J. T. Harrison, C.E., on behalf of the Local Government Board, into an application from the Eastbourne local board for permission to borrow £3,850 for supplemental works in connection with the disposal of the town sewage. Mr. A. G. Willis, resident engineer to the Duke of Devonshire, explained that it is proposed to adopt the sewage ejectors of Mr. Isaac Shone, of Wrexham, and Lieut-Col. Jones, V.C., declared the plan to have been a success at Wrexham, while Mr. H. Currie, architect to the Duke of Devonshire, and others spoke in favour of the scheme.

The *Salisbury Journal* calls attention to the fact that some shrubs have been planted on the north side of Salisbury Cathedral between the transepts, in order to conceal a gas-engine house which has been erected on the east side of the principal transept, for the purpose of working the bellows. Instead of planting trees, which will hereafter efface the lines of the noble plinth and base moulds which Professor Willis had rendered visible 30 years ago, it is asked whether it would not have been better and more in accord with Gothic precedent to have designed an engine-house in accord with the cathedral, and to have boldly shown it?

A new free library and reading-room, being erected at Luton, by public subscription, is nearly completed. It is of a Free Italian style, built of local bricks and Bath-stone; the facade is enriched with carvings by Mr. S. Horsman. The builders are Messrs. Smart, of Luton, and it is being erected from the design of Messrs. Brown and Humphrey, of the same town.

A Treatise on Horticultural Buildings: their construction, heating, interior, fittings, &c., with remarks on some of the principles involved and their application, by F. A. Fawkes, with 123 illustrations, is about to be published by Mr. B. T. Batsford, 52, High Holborn.

Messrs. Jones and Willis, of Birmingham, have just lit up Coley Church, near Halifax, with their patent Hesperus lamp. The same firm have also executed a handsome oak pulpit and reading-desk and seat for Wolston church, Coventry.

Mr. Coulton Maw has retired from the firm of Messrs. R. Dennett and Co., and the business will in future be continued by Mr. Robert Dennett and Mr. Fredk. Ingle on their own account, under the style of Dennett and Ingle, by whom all debts due to and owing by the firm will be received and paid.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill. *Use no substitute.*—ADVT.

Holloway's Pills have many competitors, though no equals, for supplying the young and delicate with a simple strengthening and purifying aperient. These pills, composed of the finest balsams, are particularly adapted for all complaints peculiar to females, and are most serviceable at the critical periods of early and mature years.

Throat Irritation.—Soreness and dryness, tickling and irritation, inducing cough and affecting the voice. For these symptoms use Epps's Glycerine Jujubes. Glycerine in these agreeable confections, being in proximity to the glands at the moment they are excited by the act of sucking, becomes actively healing. Sold only in boxes, 7½d. and 1s. 1½d., labelled "JAMES EPPS and Co., Homœopathic Chemists, London." A letter received: "Gentlemen,—It may, perhaps, interest you to know that, after an extended trial, I have found your glycerine Jujubes of considerable benefit (with or without medical treatment) in almost all forms of throat disease. They soften and clear the voice. In no case can they do any harm.—Yours faithfully, GORDON HOLMES, L.R.C.P.E., Senior Physician to the Municipal Throat and Ear Infirmary."

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—London Institution. Frederic Harrison on "The French Revolution and the Various Histories of it." 5 p.m.

THURSDAY.—St. Paul's Ecclesiological Society. Dr. J. Wickham Legg on "Liturgical Colours." 7 p.m.

London Institution. Henry Blackburn on "The Art of Popular Illustration." 7 p.m.

CINDER-SIFTING ASH CLOSETS

Superior to Earth Closets. For Gentlemen's Houses, Cottages, Schools, &c.

NO DRIED EARTH REQUIRED.

The Sanitary Appliance Co. (Ltd.), Salford.

Doulting Freestone and Ham Hill Stone of best quality. Prices, delivered at any part of the United Kingdom, given on applicatien to

CHARLES TRASK,

Norton-sub-Hamdon, Ilminster, Somerset.

—[ADVT.]

McLACHLAN & SONS, 35, St. James's-street, S.W. Builders, Decorators, and House Painters. Designs and Estimates.

General Repairs and Alterations Executed. Experienced Workmen always in readiness, and sent to any part of the country.—[ADVT.]

BATH STONE.

SUMMER DRIED,

CORSHAM DOWN,

100,000 Feet Cube.

PICTOR & SONS, BOX, WILTS.

[ADVT.]

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender—it adds to the value of the information.

BARCOMBE, NEAR LEWES.—For alterations and additions to Barcombe House, Barcombe, Sussex, for T. J. Elmore, Esq. Mr. George Fuller, architect and surveyor, Lewes and Eastbourne. Quantities supplied:—

Newnham, J. M., Brighton ...	£2,985	0	0
Lockyer, G. R., Brighton	2,940	0	0
Parsons, H., Brighton	2,880	0	0
Barnes, J., Brighton	2,874	0	0
Cheesman and Co., Uckfield ...	2,830	0	0
Card and Son, Lewes	2 737	0	0
Patching and Son, Brighton* ...	2,663	0	0

* Accepted.

BURNTWOOD.—For the erection of new infant-school, with boundary walling, &c. Mr. Samuel Loxton, architect, Bank Chambers, Walsall. Quantities supplied by the architect:—

Widdowson, G....	£840	0	0
Wiley, W.	807	8	0
Blanchard, W.	800	0	0
Insley, G.	796	10	0
Loughton, J.	776	0	0
Brailsford, J.	764	11	0
Callende and Day	760	0	0
Traces, H.	739	0	0
Heap, W. B.	736	0	0
Marshall, G. H	721	0	0
Teece, S. S.	697	0	0
Bennett, W. T....	689	0	0
Wistance, W.	678	11	0
Bedford, A. C.	675	13	6
Barton, R.	675	0	0
Guest, J....	675	0	0
Jones and Son	675	0	0
Moore, D.	658	0	0
Bate, J. H.	650	0	0
Bentley, E.	650	0	0
Lynex, A. (accepted)...	645	10	0

BRIGHTON.—For alterations to two shops in Blatchington-road, West Brighton, for Mr. J. Wells:—

Blaker	£267	7	0
Creswell, H. (accepted)	207	10	6

BRISTOL.—For a new front and alterations to warehouses, Back-street and Welsh Back, Bristol, for Messrs. Davies and Co, Mr. Herbert J. Jones, architect:—

				Allow for old material.		
Sharp and Graham ...	£912	0	0	£60	0	0
Virgo and Ford... ...	898	14	0	18	0	0
Lewis and Edbrooke ...	834	4	0	137	4	0
Eastabrook and Sons	834	0	0	60	0	0
Bastow	829	0	0	25	0	0
Love	760	0	0	34	0	0
Banner	680	0	0	10	0	0
Crocker	675	0	0	—		
Krauss	627	0	0	—		
Johnson (accepted) ...	605	0	0	25	0	0

CARLISLE.—For coffee-tavern, reading-room, shop, &c., Carlisle. Messrs. Hetherington and Oliver, architects:—

Armstrong, C. and J.	£1,105 16 8
Metcalfe, J.	1,039 19 1
Court, W.	1,032 5 1
Bell, J....	1,015 8 0
Court, H. and R.	1,012 0 6
Black, Geo (accepted)	918 16 5

(Architects' estimate, £900.)

CLACTON-ON-SEA.—For the erection of the "Railway Hotel," Clacton-on-Sea, for Mr. F. Snelling. Mr. G. Gard Pye, architect:—

Everett and Son	£5,370 0 0
Beard, J. (accepted)	5,010 0 0
Forshaw, J. H.	4,724 0 0

CLEY-NEXT-THE-SEA.—For a new road from the town to the sea:—

Tubby, C., Brixton (accepted) ...	£135 0 0

COVENTRY.—For the erection of factory at Kingsfield Works, Foleshill, for Messrs. J. and J. Cash. Mr. Herbert W. Chattaway, architect:—

Frith, G., Coventry	£970 0 0
Brown, J., Coventry	964 0 0
Haywood, C., Coventry	895 0 0
Worwood, J., Coventry (accepted)	873 0 0

DEAL.—For laying 9in. piping at North-end, for the town council:—

Chandler, S. and W. (accepted) ...	£55 0 0

EAST DEREHAM.—For the execution of sewerage works, for the local board of East Dereham, Norfolk:—

Hubbard, W., Dereham (accepted)	£2,843 0 0

[Lowest of 14 tenders received, of which the highest was £5,510.]

FULHAM.—For erecting and finishing complete, four shops, dwelling-houses, and stables, on the Greyhound-road, Fulham, S.W. Messrs. Habershon and Fawckner, architects:—

Williams, Croydon	£4,200 0 0
Johnson, Hammersmith	3,990 0 0
Higgs, Loughborough	3,848 0 0
Niblett, Highbury	3,808 0 0
Morton, Kew...	3,800 0 0
Parker, Peckham	3,798 0 0
Shapley, Old Kent-road	3,795 0 0
Brealey, Hammersmith	3,790 0 0
Ward and Lamble, Holloway ...	3,697 0 0
Jones, Gloucester	3,675 0 0
Kearley, Uxbridge	3,667 0 0
Johnson, Wandsworth	3,610 0 0
Childs, Tottenham	3,600 0 0
Judd, Mile End	3,570 0 0
Castle, Redeross	3,569 0 0
Clout, New Southgate	3,487 0 0
Bull and Cooper, Chelsea	3,459 0 0
Beale, Battersea	3,457 0 0
Price and Richardson, Clapham...	3,399 0 0
Battley, Old Kent-road	3,398 0 0
Evans, Peckham	3,175 0 0

GLOUCESTER.—For the erection of the second lunatic asylum for Gloucester, at Barnwell, near Gloucester. Messrs. Giles and Gough, of London, architects. Quantities by Mr. C. H. Goode:—

King, Gloucester	£27,000 0 0
Groome, London	25,800 0 0
Garlick, Birmingham	25,555 0 0
Trevens, Plymouth...	24,350 0 0
Lissaman, Leamington	24,042 0 0
Howell and Sons, Bristol... ...	24,000 0 0
Rigby, Worksop	23,962 0 0
Welsh, Hereford	23,950 0 0
Thomas, Pembroke	23,341 0 0
Vernon and Ewens, Cheltenham	23,229 0 0
Meredith, Gloucester	23,057 0 0
Jones and Co., Gloucester ...	22,950 0 0
Brock and Bruce, Bristol... ...	22,700 0 0
Krauss, Bristol	22,689 0 0
Ashbee and Sons, Gloucester ...	22,500 0 0
Clutterbuck, Gloucester	22,500 0 0
Smith, Birmingham	22,478 0 0
Neill and Son, Manchester ...	22,360 0 0
Davies, Cousins, Cardiff	22,350 0 0
Appleby & Lawton, Milford Haven	22,200 0 0
Lovatt, Wolverhampton	22,137 0 0
Pattinson, S. and W., Sleaford...	21,990 0 0
Drew, Chalford	21,519 0 0
Church, Bristol	21,474 0 0
Forse and Ashley, Bristol ...	20,927 0 0
Veals, Bristol	20,900 0 0
Sharman, London	20,580 0 0

HIGHGATE.—For pulling down and rebuilding a house and shop, No. 143, Highgate-road, Kentish Town, for Mr. W. O'Hara. Mr. James Robert Furniss, architect:—Dixon, 47, Highgate-road, N.W. (accepted) £811 0 0

HORSHAM.—For the erection of a curator's lodge at the new cemetery:—

Skinner, T. (accepted)	£285 0 0

[Lowest tender received.]

ISLINGTON.—For laundry works at the workhouse, for the Islington board of guardians:—

Jacques (accepted)	£225 0 0

LEICESTER.—For the erection of a pair of cottages, for Mr. G. Hartshorne. Mr. Chas. E. Willoughby, architect, 77, Welford-road, Leicester:—

Lowery, P.	£674 0 0
Brown, R. W.	671 10 0
Southam, H. B...	653 0 0
Gilbert and Pipes	651 0 0
Langton and Son	644 0 0
Bass, C.	638 0 0
Knight and Baxter	600 0 0
Bland, H. and Sons	599 10 0
Riddett, J.	593 0 0
Clark and Garrett	593 0 0
Marston, J., Farnham-st. (accepted)	533 0 0

LIVERPOOL.—For lighting, by electricity, twelve of the principal streets in the city during one year, from sunset to sunrise, for the city council:—

Siemens, Bros.	£2,895 0 0
Brush Electric Light Co.	5,800 0 0

[Cost of present lighting by gas, £1,288.]

LONDON.—For making various alterations at the "White Horse," North-street, Fitzroy-square, for Mr. Shannaw. Mr. James Robert Furniss, architect:—

White, 26, Park-street, N.W. (accepted)...	£333 0 0

ROUPELL PARK.—For new road, sewer, &c., on the Roupell Park Estate, for the British Mutual Investment Company (Limited). Messrs. John Giles and Gough, architects. Quantities by Mr. C. H. Goode:—

Carter	£2,137 0 0
Tilbury	2,124 0 0
Killingback	2,046 0 0
Meston...	2,022 0 0
King	1,877 0 0
Parkhouse	1,775 0 0
Mayo	1,711 0 0
Nicholson	1,590 0 0

SOUTHAMPTON.—For the enlargement of St. Mary's Vicarage, Southampton. Mr. A. R. Barker, architect, London:—

Brinton and Bone, Southampton ...	£690 0 0
Bull and Son, Southampton ...	660 0 0
Goodall, Worting	591 4 0

SOUTHAM.—For Southam sewage outfall works, for the Southam rural sanitary authority. Mr. E. Pritchard, engineer, 27, Great George-street, Westminster, S.W., and 37, Waterloo-street, Birmingham. Quantities supplied by engineer:—

Ottaway, F., Oxford	£3,226 14 2
Dovener and Quesnel, Stoke ...	2,115 5 5
Rowson and Co., Stoke	1,719 10 11
Smith, J. W., Westminster ...	1,600 0 0
Smith, G. F., Milverton	1,404 0 0
Watson, G , Southam	1,390 0 9
Currall and Lewis, Birmingham...	1,246 0 0
Dewitt, J., Harbury	1,198 0 0
Green and Son, Warwick	1,177 12 0
Law, Geo., Kidderminster ...	1,139 0 0
Burkett and Co., Birmingham ...	1,045 0 0
Palmer, A., Birmingham (accepted)	979 0 0

(Engineer's estimate, £1,188.)

SOUTHGATE.—For the erection of parochial buildings. Mr. A. R. Barker, architect, London. Quantities by Messrs. J. S. Lee and Son, London:—

Newby, Southgate	£2,782 10 0
Pocock, Wood-green	2,632 10 0
Kerry, Southgate	2,500 0 0
Patman, Enfield	2,461 0 0

SOUTH LAMBETH.—For repairs, painting, &c., at the "Lansdowne Arms," Lansdowne-road, for Mr. D. Bear. Mr. Henry Roberts, architect and surveyor, 3, Sandfield-terrace, Lewisham-road, S.E.:—

Lathey, Bros.	£195 0 0
Lewis, J.	150 0 0
Fisher	149 0 0
Cracknell	138 10 0
Edgley, R. W. (accepted)	113 0 0
For alterations to bar and bar-fittings, &c.:—	
Taylor, J. W.	£303 0 0
Edgley, R. W.	281 0 0
Lewis, J. (accepted)	245 0 0

TORRINGTON, DEVON.—For alterations and additions to No. 2, Moreton Villas. Mr. W. C. Medland, architect:—

Grant, Torrington (accepted) ...	£100 0 0

WARWICK.—For construction of 3¼ miles single line, from Warwick to Leamington, for the Leamington and Warwick Tramway Co. Mr. E. Pritchard, engineer, Westminster and Birmingham:—

Mousley and Lovatt, 1, Westminster Chambers, London, S.W.

WOOLWICH.—For kerbing, channelling, and making-up James-street, Woolwich-common, for the Woolwich district board of works:—

Best, J. W., Plumstead	£597 0 0
Mowlem and Co.	356 0 0
Rutley, Bromley-by-Bow (accepted)	344 0 0

BEST BATH STONE.

Westwood Ground, Box Ground Combe Down, Corsham Down, and Farleigh Down.

RANDELL, SAUNDERS, & CO., LIMITED,
CORSHAM, WILTS.

COLLINSON & LOCK,

MODELLERS, WOOD-CARVERS, AND DECORATORS.

MODELLED PLASTER WORK for Ceilings, Wall Panels, and Friezes, as in the best Old English Manor Houses.

WOOD CARVING in the style of the Renaissance, and used constructively in the enrichment of Interior Woodwork and Furniture.

PAINTING & DECORATING. of an artistic kind. Richness of Colour and Effect produced by Simple and Inexpensive Methods.

Specially Designed and Coloured Wall and Ceiling Papers.

109, FLEET STREET, & 3, ST. BRIDE STREET, E.C.

THE BUILDING NEWS.

LONDON, FRIDAY, JANUARY 14, 1881.

SMOKE ABATEMENT.

LAST Friday a meeting was held at the Mansion House, under the presidency of the Lord Mayor, to take into consideration the question of smoke abatement in London, and the suggestions of remedial measures. The meeting was convened by the National Health and Kyrle Societies, who, it will be remembered, have lately been holding meetings with the object of discussing the question and organising a well-directed effort to abate the evil. The Mansion House meeting not merely ratified the work of the committee, but proved the great public interest felt in the question. Amongst those present we may mention the Right Hon. G. J. Shaw Lefevre, M.P. (First Commissioner of Works), the Earl of Aberdeen, Mr. W. Spottiswoode (President of the Royal Society), the Dean of Westminster, Sir F. Pollock, Sir U. Kay-Shuttleworth, and Dr. Farquharson, M.P. It is unnecessary to say that nothing of a very definite character was proposed, the resolutions that were carried being simply the unanimous testimony of the meeting on the injurious effects of the smoky atmosphere of London on health, and its deteriorating and destructive action upon all perishable fabrics and works of art; and that the smoke in the metropolis might be greatly reduced by the better enforcement of the existing law, and by amended legislation requiring that all premises and dwelling-houses should be fitted with smoke-preventing apparatus and improved stoves. The subject of smoke prevention is not a new question. The Smoke-Nuisance Act—passed in 1853—which applies to London, imposed a penalty of from £2 to £5 upon the owner of every furnace not constructed to consume its own smoke, or which is negligently used; but the statute has not yet been enforced with any satisfactory result, though it was amended in 1858. Many schemes have been proposed for utilising or consuming the smoke of factory furnaces, &c.; among these our readers may remember the proposition only recently reiterated of drawing the smoke of our houses into the sewers, thereby depriving the products of decomposition of their deleterious properties by the deodorising and disinfectant action of the sulphur which the smoke contains, and the more useful idea of economising the waste heat of our smoke flues.

Mr. Ernest Hart, in explaining the object of the society of which he is chairman, dwelt upon the means of prevention. He very justly remarked that by preventing smoke they would not prevent fogs, but that the evils might be considerably diminished, as it is quite certain that smoke adds to the opacity of fog and renders it corrosive and irritating. To the architect, the destructive effect of the smoky fogs of London is a matter of supreme importance, as the action of smoke, and especially the sulphurous acid it contains, is particularly destructive to all limestones used in buildings. The letter read from Mr. F. W. Burton, on behalf of the trustees of the National Gallery, referring to the injury done to the pictures in the collection, and the letter Sir F. Pollock read from Sir F. Leighton, are proofs of another kind of destruction, no less calamitous in its results. The means resorted to to protect the pictures is by covering them with glass, a plan which turns the picture into a mirror, and which spoils the effect of an oil-painting. We have thus actual evidence that a smoky atmosphere is most fatal to works of art, and to all fabrics and decorative processes. The various processes which have been applied to the external stonework of the Houses of Parliament, and to the frescoes within them, are still fresh in our memory. Speaking of the remedies, Mr. Hart said it was desirable that legislation should not be in advance of public opinion or of industrial enterprise, and with this idea in view it is contemplated to have an exhibition in South Kensington in which every kind of smoke-consuming apparatus and smokeless fuel would be shown. A committee of eminent scientific men would test the merits of these various processes and objects. Of the value of holding such an exhibition there can be but one opinion, though the committee entrusted with the collection would do well to classify the different kinds of apparatus. The names of new grates which profess to have this object in view are legion, and a great many nostrums are before the public. It is to be regretted that no very clear or definite views of the principles of constructing domestic grates have yet been put forth so as to lessen the labours of the investigators; and what is more surprising is that, as Mr. Spottiswoode pointed out in proposing the first resolution, so little is known about the nature of fog, and the conditions under which fog and smoke combine. It is somewhat gratifying to hear that the Royal Society have appointed a committee to investigate the facts connected with the formation of fog, consisting of Professor Frankland, Professor Abel, and Dr. Russell; and we hear almost simultaneously of a paper read before the Royal Society of Edinburgh by Mr. John Aitken, which throws a new light on the origin of fogs and dust.

According to Mr. Aitken, dust-particles in the air form the nuclei on which vapour condenses, and that, in short, "if there were no dust there would be no fogs, no clouds, no mists, and probably no rain." His laboratory experiments with moist air at various temperatures may be taken with some reserve as hardly applicable on a larger scale; but if the conclusions he arrives at can be accepted, they will lead to the rejection of all proposals to diminish our town fogs by the means the National Health and Kyrle Societies have in view. The heating of any substance, Mr. Aitken shows, gives off a fume of solid particles which, introduced into a receiver with pure air, produce a dense fog when mixed with steam; but as the principal source of fog-producing particles in our towns is the smoke and sulphur of our coal fires, there is some ground for the hope that by reducing the use of coal fires, and by a more perfect combustion, we may at least enjoy an immunity from the denser forms of fog, and that they may be rendered freer from soot-flakes, and be less injurious to health and our public buildings.

In addition to the mortality produced by smoky fogs, and the corrosive effect of smoke on our stone buildings and art-treasures, pointed out by Mr. Hart, the loss of sunlight in large cities like London is a serious evil, not only entailing the use of artificial light during a large portion of the working day—thus adding to the mist-producing particles—but causing considerable depression to the vital powers, to say nothing of the inconvenience felt by artists and others who require daylight for their work.

There was a general concurrence of opinion that dwelling-houses contribute largely towards the evil. It was stated that five millions of chimneys pour out their contents into the London atmosphere, equivalent to the discharge of thousands of tons of fuel.

Mr. Shaw Lefevre, speaking on the next resolution, dwelt with much force upon the growth of the London fogs. He pointed out that for years past "the air of London had been getting worse, and fogs were denser and of longer duration than formerly, even invading the summer months." Forty or fifty years ago London was famous for its roses; now they would not grow in many parts, and it was almost impossible to get conifers to thrive in the metropolis. Mr. Shaw Lefevre advocated the adoption of some other heat-giving apparatus than that in general use, and he thought the gas companies would do well to turn their attention to the production of gas for heating. For this purpose non-luminous gases might be turned to account.

Turning to the remedies proposed, we are of opinion it would be useless to resort to immediate compulsory legislation, and we agree with the last speaker that persuasion by example would have a stronger effect on the householder. If the householders of London could be induced to use smokeless fuel, such as the anthracite, in lieu of the bituminous, a great point would be gained; but we think that a more economical grate than that employed lies at the very root of the matter, facilities for the adoption of which might be given by the Legislature. Various forms of grate have been introduced of late, a few of which we have lately adverted to. The principle of some of these is that the fire is fed with fuel from the bottom instead of at the top, by which means the gases generated pass through the heated fuel, resulting in a clear bright fire. By a screw action the fuel is introduced in front. The saving effected by this mode of feeding has been computed to be as much as 25 per cent. of the coal, as all the combustible ingredients are consumed. For large factory furnaces, the feeding may be slowly performed by machinery, so that the fuel is delivered in small quantities at a time, and the admission of cold air regulated. Sufficient air for complete combustion, and a disposal of the fuel, so that the vaporised carbon may be in contact with hot air, are the two leading conditions of all smoke-consuming apparatuses; several plans, such as Jukes', have been brought out for the slow admission of fuel by machinery, and it is a fitting opportunity for the display of the ingenuity of scientific men to discover how similar conditions of equable and easy feeding, entire combustion of fuel, and consequent economy in cost, and great reduction in volume of smoke produced, may be secured in the ordinary domestic grate.

What has already been accomplished towards the solution of the difficulty will be exhibited at the forthcoming collection, to be held at South Kensington shortly. Here the joint-committee of the National Health and Kyrle Society have arranged for the display of improved fire-grates, furnaces, kitcheners, cooking, warming, and other apparatus of all kinds devised to prevent smoke or consume smokeless coal. Varieties of bituminous and anthracite coal, and other special fuels will form a part of the exhibition. A guarantee of the thoroughness with which the societies have entered into the movement is attested by the proposal to have a skilled committee of experts to test the efficiency of apparatus, and for ascertaining the relative value of the several kinds of fuel. Manufacturers and inventors have now a favourable opportunity of bringing forward their pet schemes, and we may hope to see many ingenious contrivances in the shape of smokeless grates. We think the last resolution moved by Dr. Carpenter a judicious one, namely, that the results and testing afforded by the exhibition should precede any application for amendment of the existing Smoke Act, or for new legislation in regard to smoke from dwelling houses.

THE GOLDSMITHS' COMPANY'S PRIZE DESIGNS.

THE exhibition of prize and other drawings in competition for the annual prizes offered by the Goldsmiths' Company, now to be seen at the South Kensington Museum, is rather above the average. Evidences of a more correct technical treatment of metal meet us in many of the designs brought together, and it is not less satisfactory to find that the architectural artist, true to the traditions of the universality of his art, has not thought it unworthy of his pencil to contribute designs for goldsmiths' work. Common-sense and logical fitness have too long been divorced from the art of the worker in the precious metals, and those who have sent in designs have only cared to produce lavish specimens of casting or chasing, and to have been prepossessed of the idea that the grouping and ornament used by the carver and sculptor may be applied to candelabra, inkstands, kettles, and other objects in the precious metals. The absence of a motive in design has led the artist to imitate all kinds of puerile fancies, and as cables, the texture of other materials and fabrics, cornucopias, festoons, and especially figures without the slightest meaning or constructive connection.

Figures and figure-grouping seem to possess a wonderful charm in the minds of those who compete for prizes in this competition, and we have on more than one occasion spoken of the taste as something to be striven against, and to be discouraged by those who award the prizes. The evils we have deplored as regards design in the precious metals have arisen mainly from the divorce that has so long existed between the artist and the actual metal-worker, a separation which has tendered to dissever the principles of applied art from the real work, creating a class of workers in metal who, having no knowledge of ornamental art, feebly imitate with meaningless labour every little detail, instead of expressing them in a generalised manner. With this class of designers, the imitation of a festoon, a cornucopia, or a figure is much easier than the mental effort of inventing ornament; we may, for instance, illustrate this remark by referring to the designs for a silver candelabrum, the £40 prize for which has been won by J. W. Bradburn, of Coalbrookdale. It would be unfair to other competitors for this prize to say the distinction won by this award is merited, or that other competitors have not by their designs challenged the justice of the decision. The design by H. Stannus, of Kennington Park-road, for instance, for a candlestick to carry five lights, which wins the £30 prize, is more original in conception, and exhibits technical merits that have been lost sight of in other designs. The design awarded the highest prize is a seven-branched candlestick, of the type usually met with in synagogues, and the author has, in his drawing, alluded to this use, a condition not warranted in the instructions. The design is faulty in scale, the sockets for the candles much too small—a defect which gives a fictitious proportion to the branches. Figures of Moses and Aaron with the Tables of the Law are shown, at the corners of the foot or base, and appear rather wanton introductions. The work is intended to be cast and chased, and the author estimates its value at £200. The drawings are neatly executed, and delicately shaded in India ink. We may remark, in referring to the technical qualities of the designs, that only one competitor, Mr. Stannus, has taken into consideration the importance of constructing the work so as to take to pieces for the purpose of cleaning, a very necessary point in the design. The branches of the candlestick we allude to are formed and cast so as to be easily fixed in sockets on the stem, on the principle of the bracket, and the author has not neglected the value of giving a good fixing to each branch. The design with monogram "W. A. W." has merit; the stem and branches indicate study of requirements, and ornament has not been lavishly bestowed. Two other designs, distinguished by a profuse display of unmeaning and baroque ornament and vulgarity of treatment, are only exhibited, it is hoped, as instances of what to avoid. No plan of the base is given, and in one case the drawing furnishes an ironical comment on the motto. But we pass on to notice the prize design for a dessert stand, by W. H. Singer, of Frome, Somerset, an artist whose work is generally marked by taste. This design which obtains the money prize of £20 has one fault in spite of some good points. The dish has a top-heavy look for the small stem and foot, and the cylindrical portion below the dish in repoussé work, suggests a clumsy effect in execution, while the relief would scarcely be seen in perspective unless the eye were low enough. The ornament introduced in the stem is cast and chased, and there is an elegance in the outline and treatment of the latter which deserves notice, and atones somewhat for the rather ungraceful profile of the upper part. For a silver salt-cellar, a prize of £20 has been given to F. Marriott, of Chelsea, for a rather commonplace design, more pleasing in its general form than the ornamentation. Another sketch for a salt-cellar in silver-gilt, Japanesque in spirit, and simple in outline, with foliage laid on, has the motto "Peeping Tom." J. Holgate, of Chelsea, takes an extra prize of £10 for a salt-cellar, deserving, as it appears to us, of a higher recognition. The base is triangular, and the receptacle is supported on three figures; there is more originality in the conception, and the details are worked out with an architectural feeling, the ornament being cast, stamped, and chased.

The designs for a tea and coffee-service called for the exercise of some skill; the shape and outline of the vessels, and the mode of joining the handles and spouts, so that the latter should appear to be the outgrowth of the vessels, and serve their end in the best manner, having in view the uses of the utensils, rather than become mere apendages, are points to which the thoughtful artist would naturally direct his attention. The design to which the sum of £20 has been awarded is by H. Stannus, and we must confess that the author's work is deserving of it; on the other side of the screen is a design unrewarded, however, which to our mind displays greater merit, and we are led to believe, by the drawing, that it is the work of the same author. In these designs, the principles of stability, ease in pouring, and the junction of the spout with the body of the vessel have been attended to; the base secures the first condition, the upper portion of the pots do not overhang; the handle is placed low down, and springs from the larger part of the body so as to give better control, and the spout is also joined in such a way as to lead out of the body in the most graceful manner, instead of appearing stuck on to it. The ornament has been suggested by the use of each object; thus we find simple chasing or engraving, to symbolise flames, are introduced round the underside of the teapot, the sugar-basin has its bowl reticulated by hexagons, to represent the crystals of sugar. Some of the designs in this class show an inadequate idea of metal relief; the ornament is too highly embossed for easy domestic cleaning, instead of being flatly treated, enabling the metal to be burnished, and utility seems to have been the last of the motives of the artist. We find inattention to the laws of liquid-holding bodies, and of utility in handling, prominent in many of the designs for a silver tea-kettle. The prize of £20 has been awarded to R. Needham, of Heeley, Sheffield. The design has a chased body, with a stand cast and chased; there is some originality in the outline of the kettle, though it exhibits shortcomings in the elements of good design. The spout is awkwardly joined, the handle is not hinged, and the cornucopias and ropes in the stand betray a want of appreciation of the fitness of such ornament. Extra prizes of £10 are awarded to W. H. Singer, of Frome, Somerset; H. Stannus, Kennington Park-road; and F. Gibbon, Cirencester, for designs. The first shows a kettle of rather heavy form, with hammered ornament in the body of Jacobean character, and with a large handle of disproportionate size; the second is better shaped, of Renaissance design; has a hinged-handle for turning down, and the author has wisely pivoted the kettle on the stand, so that it may be tipped forward for pouring; the body also steadily rests at two points on the stand. The kettle is stamped in sections and chased. We need scarcely remark the excessive elaboration in the design of F. Gibbon. Lacking in outline and elegance of design, the author suspends his kettle from two ornamental supports, one on each side of the body, and the manner these are drawn show a very ricketty fixing, and scarcely any lateral strength.

The inkstand designs are poor; we prefer the extra prize design by J. R. Duffield, Birmingham, to the one awarded the £20 by M. Hayes, of Chelsea, which is of an awkward shape, with no place for pens. Exception, also, we take to the hand-mirror by J. Sherlock, a treatment which shows a misconception of the use and mode of handling of a mirror. The drawings for dessert-knife, which take a prize (J. R. Duffield, Birmingham), are not remarkable for any particular merit.

Of the models, the £50 for the best group in plaster, finished for casting, has been deservedly won by Harry Barrett, Mottingham, Kent, for a spirited group, a cavalry officer with flag of regiment. W. Allan, Lambeth, receives a £20 prize for a horse drinking. The other designs exhibited possess more or less merit as groups, but in technical qualities and anatomical accuracy fail. Specimens of flat-chasing, by G. E. Brown, Farringdon-road, and of engraving by W. R. Cooke, Islington, receive prizes. E. Beresford, St. John's-road, receives a prize of £10. If the committee of selection insisted on sections and sketches in perspective, they would be adding considerably to the value of these competitions as tests of design.

WINTER EXHIBITION OF PAINTINGS AT THE ROYAL ACADEMY.—II.

IN the great Central Hall gallery there is an opportunity rarely to be had of comparing masterpieces of our four great artists: Gainsborough, Sir Joshua Reynolds, G. Romney, and Sir David Wilkie, all in perfect condition, even the Wilkie showing no signs of decay. The Nos. are 177, 180, 175, and 176. Sir Joshua's portrait of Lady Elizabeth Herbert and child is unusually rich in colour and happy in composition. She is seated, in a white dress and brown scarf, the child being undraped, looking up into her face and holding her chin in his left hand; there is a telling piece of landscape with trees and blue sky for the background. The owner, Lord Carnarvon, also exhibits another beautiful nude picture of a child, "Cupid Sleeping on a Cloud" (No. 34), equally good in every way. His other Sir Joshua (No. 181) has rather an amusing history. Colonel Acland and Lord Sydney are represented as shooting red deer with bow and arrow—rather a curious process, one would think, for the year 1770. These gentlemen,

who were great friends when the picture was ordered, but fell out before it was finished so that neither of them would pay for it; rather hard upon the artist. Might not the comicality of position have added to the disinclination of either of them to possess the painting? G. Romney's "Mrs. Banks, of Kingston Lacy," No. 175, is as elegant and refined as Sir David Wilkie's "Thomas Erskine, Earl of Kellie," is full of character and vigour. Miss Clara Montalba is to be congratulated upon the possession of the only picture by Velasquez, No. 102, "The Flute-player." The vigorous and bold treatment, doubtless, would delight an artist of her calibre. Of the many portraits by Van Dyck, No. 90, "The Wentworth Family," is of very high quality; the figures are somewhat too evidently arranged to pose, but as a whole, it is a grand picture. Thomas Wentworth himself is very fine. Nothing could be better than the painting of the armour of the gentleman who stands behind the daughter. The finest example, however, No. 137, occupies the post of honour in gallery No. III. It is of the noble dimensions of 117½in. by 106in., and was painted in 1634. The subject is "The Duke of Nassau, his wife, son, and three daughters," whose names and titles are fully inscribed on a pillar to the left. This is much less mannered than the former painting. The colouring is excellent and balance of the parts complete. All is natural, harmonious, and worthy of the stately personages represented. The best single figure is the portrait of Christian, Countess of Devonshire. She is of full length, and dressed in a finely-painted black-satin costume, with pearls round her neck, and having a single ring, the stone of which literally sparkles on her finger. There are several good Italian portraits, one (No. 145) of a Virtuoso, by Parmigiano. The Earl of Strafford's portrait, ascribed to Giorgione, seems to us more like the work of Paris Bordone. Andrea Del Sarto's portrait of himself (No. 150), if, indeed, it is his own, and not that of his friend Conti, is interesting. Giambatista Moroni is well represented in the anonymous portrait, No. 162, with the inscription "Duritiem mollitie frangit." The complexion is singularly dark.

No portraits are of higher value and quality than Rembrandt's "Lady and Gentleman," No. 75. The lady is seated, soberly and handsomely dressed, with a large white ruff; the gentleman, also in black, is standing. It is in the painter's most graceful and finished style. No. 165, "Marshal Turenne on Horseback"—of life size—was painted in 1649 when Turenne was in Holland. There are few paintings by Rembrandt of so important a size. By the same artist we have "Christ and His Disciples in a Storm"—No. 168—very realistic and somewhat vulgar; and No. 161, portrait of a man, of later date and better character. By his pupil, Ferdinand Bol, we have a calm, quiet portrait of a gentleman. Mrs. Hope has no less than three beautiful paintings by Paul Potter—No. 71, a farm-yard scene, called the "Stable-door"; No. 123, a landscape with four cows, a church and houses in the distance; and No. 82, "Landscape, with cattle and sheep." This is remarkable for its fine sky, with scudding clouds, throwing a weird light on the admirably-painted animals and landscape. Of the three De Hooghes, No. 113, from Buckingham Palace, is upon the whole the most important. It represents a card party in a room, lighted by a large window; through the open door a courtyard is visible, and so the artist is able to give his favourite description of varied light. In such natural domestic scenes, accurately and unaffectedly transferred to canvas, he is without a rival. No. 126, an interior, is less powerful, but fuller of detail; and, moreover, it is not in such perfect condition as the Queen's picture. There are few more valuable pictures of the Dutch school than "The Girl with Game and Vegetables," No. 97, by Gerard Dow. It is faultless—every texture is absolutely correct. It is very similar in size, manner, and subject, to that in the Jeel collection in the National Gallery, not quite so pleasing, perhaps, but if anything more highly finished. It is instructive to see how F. Van Mieris arrives at something of the same sort of excellence in a different way. No. 121 is a capital work of this rare painter. An old man stands at a window, round which some ivy climbs; on the left is a violin, and to the right a dish of prawns. Up the stone-work below a snail is crawling, and in the ivy above is a single bright-coloured butterfly; every tool-mark on the stone is drawn. The violin itself is a perfect marvel of realistic painting. No 128 is the best Ostade. "The Village and Church," No. 115, by Jan Van der Heyde, is bright and sunny, and greatly increased in importance by some of the most delightful figures that Adrian Vandevelde ever painted. Except a good J. Crome, and the Gainsboroughs, already noticed, there are not many landscapes of importance. The following are noticeable:—Two by J. M. W. Turner, No. 173, "Kilgarran Castle on the Twyweg," in his early style, being painted in 1799; it is a lovely picture. The other, No. 178, "The Lake at Tabley," was painted ten years later. There are also two companion pictures by Claude Loraine, of good average quality, and some first-rate Venetian views by Canaletto, Nos, 86, 92, and 151; the last, belonging to Mr. H. J. Bischoffsheim, of the "Grand Canal," with the Rialto on the left, is a splendid specimen. No. 46, "Calm on the Medway," is of about the same size and consequence as the companion, painted by Sir A. W. Callcott, which was exhibited last year. It strikes us as better and more natural in colour. We do not much like the "Virgin and Child," No. 152, attributed, without sufficient reason, to Raffaelle. No. 148 seems more worthy of the name. It is a somewhat early work, and has suffered a good deal. No. 149, "The Holy Family," by Titian, is a mere wreck. Not so is "Venus and Mars," by Paolo Veronese. The figures are life-sized, full-length; one cupid is tying them together with a ribbon, while another is keeping back Mars' charger with his sword. There is a good altar-piece, No. 160, by the same artist.

Gallery No. IV. contains specimens of the early Italian, German, and Dutch schools, besides a few very fine early portraits. Mrs. H. Huth's portrait of Sir Thomas More, by Holbein, is of the highest character. He is represented nearly life-size, in a fur-trimmed gown with crimson sleeves, wearing the collar of SS., the size of the panel being 29in. by 23½in. No. 201 is also a fine work of the same master, but a good deal injured by cleaning. No. 210, by Sir Antonio More, represents, in charming fashion, the daughters of Philip II. of Spain. Near to it, and equally interesting, especially for comparison of the costume of the richest, hangs the portrait of Lady Apsley and child. There is not much of the highest class: most are either school pictures or inferior specimens. The portrait by Francesco Francia, of himself, is a notable exception, belonging to Sir W. N. Abdy, who also is the owner of No. 206, a valuable historical picture by Giorgione, of "Malatesta di Rimini and his Mistress receiving the Pope's Legate." The earnestness of the Legate, who is dressed as a pilgrim, the insolence of the despot, and the half-hesitating interest of the woman are well portrayed. All the pictures from the Roscoe collection in the Liverpool Royal Institution are worthy of notice. The "Adoration of the Magi," by L. Van Leyden, and the "Deposition," by Albert Dürer, are both full of interest, both as showing the development of German and Low Country art, and how far these great men excelled rather in engraving. There is none of the archaic stiffness and angularity in the engraved work of either of these artists which mar the beautiful colour and admirable detail of both of these pictures. The other pictures most worthy of notice in this section are No. 184, "Virgin and Child," by Pinturiccio; No. 188, "A Pietà," very remarkably treated, by Andrea Mantegna; No. 203, a fair example of Lucas Cranach, and a very extraordinary Virgin and Child and four Saints, by an unknown artist of the early Venetian school, belonging of Mr. G. Richmond, R.A.

To give more than a sketch of the exhaustive collection of drawings by John Flaxman would exceed the space at our disposal. There are 185 frames, some containing a single drawing, but most of them more, from two or three to nineteen; so that we are enabled to see how this great artist worked and attained the high degree of excellence to which he reached. At either end of the room are some larger and higher finished compositions, one of the best there, No. 85, contributed by Mr. W. E. Gladstone. There are several studies of part of the same subject. It is interesting to notice what pains Flaxman took before he satisfied himself that he had done his best. Of some subjects, we have four or five different versions. How early his talent showed itself is shown in large classical subjects, 1, 2, 3, 140, 141, and 142, said to have been commissions received by him when quite a boy from Mr. Crutch, of Sunning Hill Park. In addition to many hundreds of actual sketches, we have a thoroughly representative exhibition of the finished outlines which he drew for book illustrations. These include subjects from Hesiod, Homer's "Iliad" and "Odyssey." Some very powerful studies from Æschylus. Many of the drawings of scenes from Bunyan's "Pilgrim's Progress," designs for sepulchral monuments. Mr. W. Russell's two drawings from the antique, Nos. 102 and 108, are as highly finished as any by Andrew Mantegna, and they show the great pains taken to secure accuracy of detail. Flaxman was an excellent draughtsman of portraits. There are several admirable examples of his ability in this direction. No. 158 (1) is a capital portrait of himself at the age of 27, dated 1782. But he did a better thing still in 1778 when he was a student at the Royal Academy: we mean the terra-cotta medallion, now belonging to South Kensington Museum. Mo doubt the portrait of Mrs. Matthew, the wife of his patron, the Rev. H. Matthew, who first noticed Flaxman, when a boy, in his father's shop in New-street, Covent Garden, was a labour of love for the kind friend who would read Homer to him while he was making designs.

THE ARCHITECTURAL ASSOCIATION'S EXCURSION IN NORFOLK.

AT the ordinary meeting of the Architectural Association, held on Friday evening, Mr. C. R. Pink, hon. sec. of the excursion sub-committee, read a paper entitled "A Week in Norfolk." The walls were hung with numerous illustrations, including the series of photographs taken during the excursion by Mr. J. L. Robinson, of Dublin, and described in our columns, p. 483, last volume; Cotman's Etchings, lent by Mr. Beloe; sketches, made by Messrs. J. Johnson, W. H. Lynn, F. C. Penrose, W. J. N. Millard, C. H. Löhr, and other working members of the party; and a series of measured drawings of Sall Church, by Mr. T. C. Yates; the last-named of which are reproduced this week amongst our photo-lithographic illustrations. The President, Mr. E. C. Lee, F.R.I.B.A., occupied the chair, and there was a large attendance of members.

The lecturer introduced his subject by pointing out the advantages derived from the Asso-

ciation excursions to those who took part in them, to whom it afforded a valuable means of examining systematically, and of comparing in successive years, the best buildings of different districts of the country in an economic manner, and under able guidance. The tour was devoted to active sketching and note-taking, and the interchange of opinion between members coming from all parts of the kingdom aided in the establishment of *esprit de corps* and good feeling between members of the profession. Having paid a high tribute to the work carried out by the late Mr. Edmund Sharpe, who founded the excursion movement in 1870, he mentioned the districts visited during successive years, and expressed a hope that in 1881 the members would be able to enjoy in one of the western counties a more complete mingling of fine churches and interesting domestic work than it had previously been possible to arrange. In treating upon the immediate subject of his paper, he said he should look at the subject from an architectural rather than from an archæological point of view; and should, moreover, confine himself to the characteristics of the Late Decorated and Perpendicular parish-churches visited, for that reason passing over Norwich Cathedral, and the important examples of domestic work seen at East Barsham and Blickling-halls, and Snoring parsonage. During the 15th and latter half of the 14th centuries, there was a general rebuilding or remodelling of churches throughout East Anglia, principally attributable to the increase of wealth consequent on the establishment of the woollen manufacture in the district; and, in consequence of the diversion of trade, these large and magnificent churches were left with merely rural surroundings, instead of the bustle and business attendant upon manufacturing centres. It was fortunate that the churches had been spared, albeit ofttimes sadly mutilated; and, in almost all cases, the reverse of circumstances had prevented proper maintenance and repair. At Cawston, the fine roof was falling to pieces; the great church of Sall was now almost deserted, and given over to the bats and jackdaws; Trunch Church was also in a miserable state; at Knapton, the richly ornamented roof was decaying; the lofty tower of North Walsham was in ruins; and Deopham Church, so far as its nave roof was concerned, had been pronounced to be in a dangerous condition, and the aisles and chancel were alone used for service. The peculiarities of the Late Churches of East Anglia had been often stated thus: Grand continuous clerestories, rectangular general plan, with nave and aisles, plain square western towers of large size, absence of chancel arch, fine two-storied porches and also vestries, splendid open-timber roofs, together with other rich woodwork in tower-screens and galleries, rood-screens, stalls, benches, &c.; large stone fonts, often with rich covers, peculiarly beautiful decorative painting made on woodwork, and a profusion of surface decoration in flush flint-and-stone panel work outside. These were the characteristics of the general type, but there was great variety in its particular application, and few or none of the churches comprised all the peculiar details described. Largeness of treatment and simplicity, and grandeur in proportional lines, distinguished this late work generally. The details were also as a rule unusual and worthy of careful study, whilst the woodwork, whether constructive as in roofs, or decorative as in screens and stalls, had been brought almost uniformly throughout the district to a degree of richness and excellence unequalled in any other part of England. The lecturer proceeded to describe in detail some of the more interesting ground-plans. That of North Walsham was a simple parallelogram, the only projections being the porch and tower. The aisles were continuous throughout, and there was no chancel, and the screen forming the only division; the eastern bays of arcades were, however, solid to form the sanctuary. The plan of St. Peter Mancroft, Norwich, differed from the last in having north and south porches, a projecting sanctuary, with vestibules behind, and also very small (11ft. by 9ft.), and subordinate transepts. The internal dimensions (excluding sanctuary, which was 14ft. 6in. deep) were 100ft. by 51ft., the width of nave was 19ft., and of aisles 13ft. 6in. The arcades were of eight bays, but the several arches had various spans. The staircase turrets flanking the east end of sanctuary were somewhat unusual. St. Stephen's, Norwich, was a parallelogram, with the tower on north side over the porch, and on the same side was a small projecting chapel. The dimensions inside were 130ft. by about 50ft.; but the north aisle got narrower towards the east end, and the nave was not of uniform width. Sall Church (see photo-lithograph) possessed a more fully-developed and elaborate plan than those previously considered. The nave was 90ft. by 27ft. 6in., with aisles each 14ft. wide; western tower; north and south porches, of large size, and fully-developed transepts; the chancel was treated distinctly, and was 59ft. by 26ft. Cawston had a nave 90ft., by 54ft.; chancel, 46ft. by 25ft., with north aisles and small attached chapel, west tower, south porch, and transepts of considerable size. Hingham consisted of nave, with aisles, west tower, south porch, and chancel, with a two-storied vestry on north side. Worstead was similarly planned; but the chancel had a short south aisle, and on north side a chapel, as well as vestry. Knapton and Edingthorpe were buildings of less size, and aisle-less; but had west towers and south porches. A comparison of plans showed a general ratio between lengths and breadths, the width of aisles being often half that of nave; the total length of church double the width. At Sall the breadth of body of church was about two-thirds the length, and equal to the length of chancel; the breadth of aisles and transepts was about the same and equal to half the width of nave. At Norwich Cathedral and Hingham parish-church the level of nave-floor descended towards the east, while at East Dereham there was a more noticeable ascent to the chancel. At Knapton the chancel-floor was stepped down below that of the nave. The church towers were commonly of large size, and considerable altitude; their general plan was square, and their position was almost always at the west end. They sometimes simply abutted on the west wall of the church, as at Sall, and St. Giles's, Norwich; but in other instances, as at Trunch, the aisles extended partly along the side of the towers. The general staging of the towers was simple; there was the ordinary number of principal stages—the lowest opening into the church with a well-developed arch, and having on the opposite face a fine west window and doorway, frequently so intimately connected in design as to form one feature. At St. Giles's the span of the tower arch was the whole interior width of tower, and the depth of moulded splay to jambs was striking. Sall and Cawston afforded good instances of the combined treatment of west doors and windows. The sill of the west window rested upon a richly-panelled band of stonework adorned with shields, and the spandrels formed between this and the well proportioned and richly moulded recessed doorway were filled with vigorous carving. A canopied niche flanked the doorway on either side between it and the buttresses, and base courses were also elaborately worked with traceried panel-work. At Worstead the outer mouldings of window-jambs were continued to the ground. At Cawston the attacking hunter was represented in one spandrel under the square hood of door, and his foe, the dragon, in the other; the same subject appeared similarly placed upon St. Ethelbert's gate at Norwich. In the stage below the belfry occurred the misnamed "sound-holes," which were square traceried windows, appearing generally upon each cardinal face. The tracery exhibited the greatest variety in design, and Sall and Worstead were particularly good examples. Sometimes, as at St. Lawrence, Norwich, and at Westwick, the design was similar to that often repeated in base and string-courses—the escutcheon surrounded by trefoils or quatrefoils. Two plain buttresses to each angle of tower were the rule, and the sets-off were few in number. At Deopham, Hingham, and St. Peter Mancroft, the angles made with the tower were canted off; and at Wymondham the buttresses were semi-octagonal on plan, and had small angle-shafts. There was an absence, almost universally felt, of that gradual diminution of bulk and change of plan which gave such a charm to the tower buttressing in Somerset. Trunch and St. Giles's, Norwich, offered the most striking examples of violence and coarseness in the sets-off; but there was a general want in the Norfolk designs of any leading up to pinnacle and parapet as the crowning features. The tendency was to stop the buttress below the belfry, and if continued above this it was often, as at Sall and East Dereham, in the form of a pilaster. The parapets were generally plain, but even the enriched battlements and angle pinnacles of the altogether fine tower at Sall seemed to want character, and the whole design suffered from a lack of cohesion when compared with, say, Bruton or Evercreech. There was also but little variety or piquancy in the skyline of towers, and the staircase turret was rarely a prominent feature, and spires were still more rare, the only examples seen during the excursion being those of Norwich Cathedral and Great Ellingham and New Walsingham Churches. He had obtained some dimensions of the principal towers, and found that Wymondham was 142ft. high, Hingham and Cawston both 120ft., and St. Peter Mancroft about 100ft. Sall measured externally 27ft. by 27ft., Worstead 28ft. by 28ft., and Hingham 33ft. by 33ft. Cawston tower was remarkable in this district from the fact that it was ashlar-faced with stone throughout. He would not go at length into the question of the round towers, of which they only saw unimportant examples. There were nearly 200 round towers in East Anglia, all of similar size and proportions, built with thick walls and without external doorways. Their dates, however, varied, as also the character and amount of decoration. Some, as at Edingthorpe, which was visited during the excursion, had the circular worked into the octagonal plan. He could not agree with the theory that the round form was adopted in a district without stone to avoid the use of quoins, for that material was used pretty freely in other portions of the churches, and he thought instances, even, of quoins worked with flints alone could be pointed out. The Rev. T. James had further held that the lack of stone led to the adoption of aisleless churches, and the omission of spires; but the former omission was the exception, not the rule, and a lack of stone could not be urged as a reason for the rarity of spires in the in every respect parallel district of Somerset. The way in which flint was used in conjunction with stone appeared to the author to show not so much a desire to save the latter, but rather a wish to obtain original effects by the use of local materials. In describing this flint panel-work, Mr. Pink remarked that flints were commonly used for ordinary walling in a rough state, as in Hampshire and other chalk districts, laid either random or in courses, projecting portions being roughly headed. They next found the flints uniformly split to give a fairly smooth face, and then squared, forming, when laid, diminutive ashlar-work. The simplest mode of using the dressed flints in conjunction with stone was seen in the plain checquer-work, as at Norwich Guildhall; but in more elaborate work there were panels, arcading, tracery, &c., of stone, filled up with split flints, carefully cut to fit into cusps, circles, and other geometrical outlines. The effect of this kind of work at a distance was to bring the stonework into relief as if by strong shadow; but where extensively used the appearance was cold and mechanical, and time had little influence in softening the outlines or surfaces of the hard, almost polished, flint panels. In some cases, moulded stone-work was used as a framework, projecting in front of the usual filling-in, as at Fakenham. At North Walsham, greater effect was gained in some canopies of the porch by an inlay of brown stone. It was by no means unusual to see in Norfolk bricks used in conjunction with flint. The porches throughout East Anglia had the greatest care and elaboration bestowed upon their design, and their large size and considerable altitude (generally of two stories) gave them almost a transeptal effect. The entrance was almost uniformly under a well-proportioned and richly-moulded pointed arch. The spandrels formed by the arch were often, as at Wymondham, Sall, North Walsham, and Attleborough, filled out to form a square head with shields, carved figures, or flint panel-work. Above the doorway the division between the stories was strongly marked in most examples by a rich band of sunk panels and shields, or ornamental flint-work. The "parvise" was generally lighted from the front by a square or segmental-headed window of considerable size, and often flanked, and sometimes surmounted by rich niches, and the front was completed by a low pedimental gable, or now and then by a horizontal line and rich battlements. Necessarily, however, there was great variety in the details of the several examples, but a comparison of the photographs and drawings would, he

thought, enforce the conclusion that the modern porch to St. Andrew's Hall, Norwich, scarcely exhibited the character and feeling found in old instances. Another external feature worthy of notice was the plinth, which was usually of excellent design, and much enriched with flint-panel-work. The abruptness of projection was very remarkable. The window tracery evinced great variety in design, the most noticeable peculiarity being the prevalence of a Flamboyant character in the Late Decorated work, and even in the Perpendicular tracery a greater use of flowing lines than usual. The principal window heads were contained under well-developed pointed arches, but in clerestories there were frequently adopted flat, four-centered arches, almost segmental in effect. Parapets were chiefly used for aisles, as the massive framing of the roofs required the use of the whole top surface of walls. In the internal arcades the distinguishing features were loftiness and excellence of proportion; the mouldings were large and effective; the rounds were capped at the springings, the hollows being continuous; and where there was no chancel arch the arcades were sometimes differentiated where they bounded the choir. An arcading was sometimes, as at St. Andrew's church, Norwich, employed on the aisle walls, a plan which, besides giving variety to the wall surface, was also useful in strengthening comparatively thin walls. Of the typical East Anglian clerestories, which almost resembled glazed gratings, so large was the window-space, so small the divisions. The Norwich churches, especially St. Peter Mancroft, afforded the best examples, and these, with their grand and massive roofs supported upon the much-pierced clerestory walls were, from the absence of tie-beams and buttresses, little short of marvellous, even to the architect. Of the Norfolk roofs there were several varieties, such as the low-pitched, with straight or cambered tie-beam or four-centred arch; the curved rib and hammer-beam (the latter sometimes concealed by a continuous cornice or cove); and the double-beam roof. In almost all examples might be noticed the springing of principals from corbels well down on the walls, curved braces forming wall arches, rich and effective cornices, and the curving down of the ridge-piece to meet the principal rafters. All, or almost all, the finest roofs had a pitch somewhat less than 45°. Having described in detail the typical church-roofs at Great Ellingham, Worstead, Cawston, Trunch, Wymondham, Knapton, Sall, and St. Peter Mancroft, Mr. Pink said that at North Walsham was altogether different from the others; but was very suggestive in treatment. The church was exceptional in the district in having no clerestory; it seemed probable that it was intended to add this feature, and that the present massive, but severely-plain, roof was provided as a temporary covering. The nave and aisles were practically under one roof. The aisles had lean-to rafters and tie-beams, and from the latter the purlins were strutted. The tie-beams went through the arcade walls, forming the corbels to the wall-posts, and curved struts which rose to the main tie-beams of the nave span, the latter beams being placed at the level of tops of aisle-rafters. Upon the nave tie-beams, at the points supported by the struts below, were placed queen-posts, forming struts to purlins, and these posts were again braced by curved ribs, which met and formed an arch under the apex of nave-roof. As examples of boarded and panelled roofs, Wymondham north aisle, Dereham transept aisles, and New Walsingham aisles might be mentioned. The Wymondham roof was a very rare instance of hammer-beam principals being used in an aisle. Throughout the subsidiary features of these churches—including the screens, stalls, benches, font-covers and doors—were to be found a wonderful variety, freedom and delicacy of design. The painting upon the lower panels of screens was of an exceedingly fine character, and suggested that it was the work of foreign artists. The figures were often admirable, and the diapered and floriated backgrounds would repay the closest study. Attention might be called to the buttressing of the stall-ends at Trunch, and to the spire-like font-covers at Sall, Worstead, and North Walsingham, in which by comparatively simple means an elaborate effect was produced. The font-cover at Trunch was almost or quite unique; its date was 1502. The effect, even in its present state, was rich in the extreme, and traces of colour decoration remained; and the cornices of the niches, curved on plan, were also, to increase their effect, curved upwards in elevation. The fonts themselves were throughout Norfolk of large size and of most elaborate character. The plan was almost universally octagonal, and the font was raised upon steps. The risers were generally enriched with panels, having sunk quatrefoils and other figures. From the moulded base of the font proper often rose small angle shafts, with perhaps carved figures at their bases, the sides of shafts being panelled or enriched with niches for figures. Angels generally supported the bowl, on the faces of which were carved the Crucifixion and Seven Sacraments, or the Evangelistic emblems, angels, armorial bearings, &c. Of these fonts the finest seen was at New Walsingham. In conclusion, Mr. Pink offered, as an excuse for any superficiality in his remarks, that the fact of his holding the office of excursion secretary scarcely conduced to his giving such careful attention and study to the buildings visited as they deserved, and as he would have wished to have devoted to them.

The PRESIDENT, in inviting discussion, expressed surprise that Mr. Pink, who appeared to exert himself to the utmost in arranging the excursion proceedings during the week in Norfolk, could have found time for observation requisite to write so analytical and detailed an examination of the churches visited.

Mr. JAMES FOWLER, Mayor of Louth, said he was glad to see the room so well filled that evening, for he considered that every member ought to aim at joining excursions of the class described by Mr. Pink. In such tours they learned much that could not be gathered from the most diligent study of books, including the effects of combinatious of colour and of light and shade on details in position. Books on architecture were to the study of actual buildings, but as a surgeon's preparation of bones and muscles were to the actual living form. The association excursions gave the stimulus of company in observation, comparison, and in preparing sketches, were productive of good fellowship, and were carried on in a more economical fashion than could be arranged by individuals. He begged to propose a vote of thanks to Mr. Pink for his exhaustive paper.

Mr. CLARKSON referred to the two principal examples of domestic work seen during the week in Norfolk, the halls at East Barsham and Blickling. Although he knew the latter building well from Shaw's book, he was not prepared for the refinement of the details, and the skilful arrangement of parts it exhibited, and in seeing it for the first time, one realised the force of the remarks of the last speaker, as to the difference between the study of illustrations, and of actual buildings. He noticed that the front of Blickling was very much pierced, and that the designer had placed at either end a shallow tower with but few openings in it, apparently for the purpose of restoring the balance between solids and voids in the façade. At East Barsham they observed that a good deal of terra-cotta was introduced for medallions and other ornamental details in the brickwork. Certainly the most impressive of the churches seen during the week was that of St. Peter Mancroft, Norwich, which possessed great dignity of design, and all the details were applied in a wonderful way, so as to aid in bringing out the architect's conception. Its shallow transepts, and two-storied vestries seemed to have been thrown out in order to add buttressing buildings to the lofty structure, and probably the small transepts and two-storied porches at Sall and other churches had a similar purpose.

Mr. MAURICE B. ADAMS thought one thing must have been evident from the proceedings of that evening to those who did not take part in the excursion, that those who went were, on their own showing, an exceedingly jovial set of people. Certainly all the excursionists worked heartily, and amongst the hardest workers were Mr. Pink and Mr. Robinson, who took the photographs. He would ask, however, what were the practical lessons to be learned from what they saw and sketched? The first was the immense distance by which we were separated from those who built these churches. They saw everything down to the least detail carried out with a thorough regard to scale, and everybody employed seemed to be in harmony with the work that was to be done. Nowadays they knew the mason thwarted the carpenter, and that the carpenter seemed to be at variance with the plumber, and that as for carving it was evident that very few men were to be found able to undertake it. Looking to the falling off in religious feeling in England, he feared it would become increasingly difficult in the future to build churches, or rather to raise money for them, and, therefore, he thought the late Norfolk work was not a style to be widely copied, for unless done thoroughly well and harmoniously, the result would be meagre and bad, as they saw in most of the Norwich churches. In the domestic works they might have seen a hint as to the proper use of terra-cotta worthy of adoption. Modern terra-cotta was too prominent, too hard, too metallic, too like cast iron. At East Barsham Hall the examples, on the contrary, had to be carefully looked for to be distinguished from the brickwork, even where the material was most freely used, and this quiet effect seemed due to the fact that it was always framed in panels, or within strings of moulded brick, and never built in simply as quoins, like stone would be. Some of the roofs in the churches visited were in a dreadful state of disrepair. At Knapton, a congregation could not use the church in wet weather, and at Deopham they had to rush across the nave and occupy only the aisles and chancel, as the magnificent nave roof is likely to fall in at any moment; but he must admit that the parson at Deopham showed a commendable anxiety that the members should subscribe towards the restoration of his church. He thought it strange that while the Institute and certain prominent members of the profession were making themselves very conspicuous in reference to St. Mark's, Venice, they ignored our fine village churches close at hand, which, like that at Knapton, were simply going to rot. What did the Institute and the people who wrote to *The Times* about St. Mark's, practically do for the preservation of our own churches? Comparatively nothing, for there was no glory in it. The S.P.A.B. would do infinitely better service to the cause of architecture if, in lieu of agitating about the pulling down of trumpery galleried inns, they would look at the way in which St. Alban's Abbey was being spoiled. Some of the cases they became acquainted with, as Deopham, Cawston, and Sall, seemed utterly hopeless, and he thought it would be more befitting if the parsons, instead of writing testimonials to cheap sherries, would do something towards keeping the rain out of their churches.

Mr. JOHN JOHNSON referred to the excellence of the domestic work at Blickling, and commended as worthy of study, the charming arabesques introduced into it. It was a remarkable thing that the designers of the large churches in Norfolk seemed to have neglected the upper portions of the structures; the plan and general design and fittings appeared to have been carefully thought over, but the upper stages of towers were poor and crude. He was struck by the skill with which the church-roofs were connected with the clerestory walls, being, indeed, thoroughly built into them. This, perhaps, accounted for the fact that they saw heavy hammer-beam roofs, of wide span, carried without a tie-beam or other cross support. In the case of St. Peter Mancroft, Norwich, one of those without a tie, it appeared wonderful how the roof had continued to stand.

The vote of thanks having been warmly accorded, Mr. Pink replied, and proposed a vote of thanks to Mr. Robinson for having given for the library an album of photographs taken during the excursion.

THE STUDY OF THE BEAUTIFUL.*

WITH regard to the law of fitness, we must be careful to consider whether beauty consists in fitness only. In nature it certainly grows out of it, but in the works of man you can find millions of examples of very useful articles being very ugly, as for instance, the chimney-pot hat, the hot-water-can, the lamp-post, the ordinary square London-street house, &c., and even this kitchen jug, which, though not offensively ugly, cannot be compared to this Greek vase for beauty of form, since it possesses none of those ornamental qualities which we have noticed in the vase. But if things were called Beautiful, only

* A paper read by GEORGE ADOLPHUS STOREY, A.R.A., at the London Institution, Finsbury-circus, Dec. 30th, 1880. (Concluded from p. 6 in last issue.)

because they were exactly adapted to their uses, then this jug is quite as beautiful as this Greek vase, because, when I borrowed it of the cook, and called it ugly, she said "It may be, sir, but its very useful," I pointed to another that seemed to me equally useful and much prettier, "Yes" she said "it may be prettier, but I don't like it so well as the other; and why, because I can't get my hand inside it to wipe it out, and I can in this one." So we must not abuse this jug for not being beautiful for it never pretended to be that, it is quite honest. It means to be useful; and if it were much better it would perhaps be worse, for it would have to be taken more care of and not left in the kitchen to be useful, but very likely would have to be put away in a cupboard. It possesses at least two great virtues, usefulness and humility. It does not say: "Look at me and notice how quaint and curious and rare and uncommon I am for a kitchen jug;" but it says, "Use me, keep me clean and don't drop me, because if you do, I shall only be fit to be thrown on the rubbish heap." Here is another work of art quite different to the Greek vase, yet full of the most precious work, and is like Greek art in this respect that it is founded on the most careful study of nature, and possesses in the details of its ornamentation, which consist of birds, fishes, and plant forms, all that expression in the outline and that exquisite finish which distinguish good art from bad, and are the characteristics of nature's own drawing. We cannot enter into the subject of Japanese art now, but I call your attention to this cabinet only as another proof that art must be studied from nature. The Japanese never had Apollo's nor Venuses nor sculptures from the Parthenon, nor Raphael's nor Michael Angelo's works to study from, and yet there is no denying that they are great artists, possessing a wonderful sense of colour, consummate taste, a love for nature, a great sense of humour, and a remarkable power of delineating human character, and also the character of every other object that they choose to represent, or to fashion into ornaments or articles of daily use.

To leave out any mention of colour in speaking of the Beautiful, would be to leave out one of its most delightful elements, and yet we can scarcely do more than allude to it. Sir David Wilkie writes:—"After seeing all the fine pictures in France, Italy, and Germany, one must come to the conclusion, that if colour is not the first, it is at least an essential quality in painting. No master has yet maintained his ground beyond his own time without it." Colour possesses the same quality of infinity that we have noticed of form, and a composition of colour must have the same qualities of unity, of repetition, of gradation, of breadth, of proportion, of consistency, of contrast, of variety, of interchange, that a composition of lines or masses must have. But the colours of things, like the forms of things, must be studied from nature; it is only the continual intercourse with nature, that can give the true power of colouring. Here are water-colour sketches, made for the most part out of doors, (though perhaps nothing to boast of) which exemplify this. I know I could not get colour as good as is even shown here, unless I had taken it straight from nature—not that I have ever yet been satisfied with any sketch that I did, at all events, at the time it was done, and when the perfect nature was still before me. Excuse me for speaking about myself; but there is something so subtle, so intricate in this subject of colour, that I know not how to speak of it by any other means, than by mentioning my own sensations about it. Colour seems to me to reflect our emotions almost more than anything else. A bright sunny day rejoices us with its sparkle, its mirth and colour; is all astir with strong lights and strong shades; all seems merry, and the air is full of music, what with the birds singing, and the children laughing among the flowers. Then there is the golden-grey day; the sun is slightly veiled, and the tones of nature are rich, and deep, and mellow, like the tones of a church organ: this gives us a deeper and a calmer sense of joy. Then there is the drisly, foggy, dreary, dark day, when there is no colour anywhere; when the air is charged with the smoke and dirt of chimneys, and that is dreadful. But there is also in evening another scale of colour; a gradual change from the rich gold and crimson of sunset, to the cool and silvery tones of departing day, when the trees grow dark against the sky, and a refinement of strange mystery envelopes all around; every colour seems to assimilate itself more and more to the other and the bright flowers are no longer seen. And then comes night, the reign of paleness and darkness, a symphony in faint gold, faint blue, purple, and warm black, with gleams of sombre green, and bright touches of silver; these are the restful—the sad colours. I can quite understand an artist in his great enjoyment of the effects of colour as nature shows them to us in these different scales being tempted to make colour the one and only aim of his art, but the great colourists have been men whose sense of proportion taught them that art was not colour only, nor form only; but the combination of all the elements and characteristics of nature. For how can that art be said to be founded upon nature, which would represent her, or rather misrepresent her as a shapeless assemblage of tints, and tones—however beautiful they may be in themselves? We might almost class our painters under these different headings. The "Sunny day Painters." First and foremost of these, is Paul Veronese, whose brilliant and pure colours are enhanced to the utmost, by gentle contrast, and where necessary by positive contrast and so harmonised, that, in his enormous and fearless compositions, they make one magnificent chord of silvery sunny day colour. Note as examples the Feast in the House of Levi, in the Academy at Venice; the Marriage at Cana, in the Louvre; the Family of Darius at the feet of Alexander, and the Consecration of St. Nicholas in our own National Gallery in London (although unfortunately these pictures have lately from some cause, not explained, turned dark, and have lost much of the brilliancy that they possessed when these sketches of them were made). Then comes Bonifaccio with his "Rich man at table," in the Venetian Academy; Benozzo Gozzoli, and Rubens the magnificent, nor must we leave out the modern pre-Raphaelites, and many of our water-colour painters, nor our landscape painter Turner, whose works come under all the headings that we have mentioned—he is one of the exceptional men. Nor need I say, that there are many living now, whose names I cannot mention, who are essentially sunny day and glad colourists. "The golden grey day." First and foremost in this school of deep toned harmony, comes the great Titian, and then Giorgione, and I know not how many others. Cuyp and De Hooghe, and other Dutch and Flemish masters, show us the beauty of this veiled sunshine. To give a list of all the painters who come under these different headings, would be impossible now, we can only give the first examples that occur to us. But the painters who delight in the tranquil shades of evening are many. Cousens and Girtin, and also Turner are beautiful examples.

I most regretfully leave this subject of colour; to study it perfectly in all its bearings would lead us into a science as deep and almost as perfect as geometry, though more difficult to demonstrate; and we might have problems in colour, as in geometry, such as "Given—a rose whose petals graduate from creamy pink to deep crimson, what proportion of other colours is necessary to give that rose its utmost value—or Given a bunch of red poppies, what proportion of other colours is necessary to make them quiet themselves down or to make them sing out still louder? Or, Given deep ultramarine, and scarlet, and purple, and green, and gold, and silver, in what proportion shall we distribute them, and in what manner shall we vary them, or reflect them into each other, so as to produce the richest chord of colour? Beautiful colours are like so many sweet spirits all trying to make each other as happy as possible; now standing side by side, in almost imperceptible gradations to help to the beauty of the group; now sacrificing themselves and putting themselves in the shade, in order that some bright sister may look still more beautiful and precious. One would think that there was a deep philosophy in colours, which taught us to think more of others than ourselves, for in thus behaving towards each other, they show forth their own degrees of perfection and beauty, be it the quality of retiring humility consenting to hold the second rank, or of supremacy obliged to hold the first, or of power of richness, or of tenderness, each and all possessing beauty and lovableness, and agreeing with each other for ever, without satiety, without monotony. Methinks it would be pleasant to live in a paradise of that sort. But imagine now an assemblage of just the opposite kind, where each colour is jealous of the other, and keeps coming forward and saying, here look at me, don't look at any body else, like the star actor who thinks he will appear so much greater if he surrounds himself with "poor sticks," as they are called, and then fancy them fighting amongst themselves, and looking black and jealous at each other, and all making each other appear even more ugly than they really are, and all governed by jealousy and selfishness instead of humility and love, and then you have just the opposite of the Paradise of the good colours in the limbo of the bad ones.

One word about the manipulation of painting, the quality of handling. What we call fine painting is such as that of Velasquez, or Vandyke, or Veronese, or any other master who knows what he has to do, and does it at once fearlessly and yet feelingly. It is not a quality to be learnt or to be sought, for it comes of its own accord. Every characteristic of a painter's mind is exhibited in his touch. It is his hand-writing, and although it is of the greatest importance for the artist and the connoisseur to know this, as by it the painter of a work is recognised, there is not time now to do any more than call attention to this very subtle and curious feature in the art of painting. But how little are we advanced in the study of the Beautiful, and how much more is there to be considered! We have as yet spoken only of outlines of forms, and of colours and their combinations. But now let us imagine a beautiful countenance—the looking-glass of the mind. It may be kind or full of disdain, it may be passive, or laughing, or frowning, doubtful, sorrowful, anxious, suplicating, full of pity, and, indeed, possessed of every variety of expression, all of which it is part of the mission of art to depict, and to go further still, and to depict the reasons for it—to tell a story, or a history, or represent a drama. False sentiment is never found in good art. The subject of a picture may be revolting and terrible, and yet it may be a grand work if it is true in sentiment. But the most lofty and most poetical subject may be easily spoilt by unnatural attitudes and affected expression. It is the "touch of nature makes the whole world kin," and he who would depict the actions of men, the passions of men, and even their thoughts, in their faces, must himself be human; he may be as divine, or as poetical as he likes besides, but he must first be human, so that he may sympathise with and enter into all the feelings of joy or sorrow of his fellow creatures. To exemplify this would, be impossible this evening, but I may refer you to Mr. C. R. Leslie's book which he calls "A Handbook for Young Painters." In that book you will not only find pointed out in the most clear and unaffected way how great subjects, and also little subjects, have been treated by great masters, but you will also see there how learned, how just, and how interesting is the art of sound criticism.

Let us next deal with the Study of Nature. All schools of art, and all artists individually, are excellent in proportion as their works are founded on the study of nature. And the real academy of art is in the green fields, among the wild flowers, in the woods and on the rivers, in the sea and in the sky, and in all the living things that inhabit them, and among the mountains in all their grandeur. And then, again, in the streets of towns, at home or abroad, where every day we may see something, whether an incident, an attitude, or a group, that will furnish us with material for our art. And so, again, in the homesteads, in the playground, on the battle-field, in human action, in joy and sorrow, and in the human heart. And if our students study earnestly and lovingly in this academy of nature, and there are many I know who do, then I can see no reason why modern art, and art in this country, should not be capable of equalling, I will not say of surpassing, the art of the ancients. I say I see no reason why it should not be capable, I do not say that it does, or that it will, but still the road is open to us. Surely nature is as lovely now as ever she was. We have, I think, as kindly feelings now as ever man had; and I will venture to say, that women are as beautiful, children as sweet, and men as handsome as ever they were. Why, then, should not art be as fine now as in the old days? Here are toy-books by modern artists that are as fine of their kind as anything that was ever produced. *The Mad Dog*, *The Three Jovial Huntsmen*, *Sing a Song for Sixpence*, by Mr. Caldecot, are full of fun, of

action, and of real humour, and are founded, every stroke of them, on nature. The drawing is exquisite, whether it be of the figures, the landscape, the horses, the birds, or the dogs and other animals; and every composition in them, however slight, is in conformity with the laws of art. These books cost but a shilling each, yet may be of countless value to the country, if we calculate the amount of delight and improvement in taste that they may impart to the rising generation. Think of the toy-books that were supposed to delight many of us when we were children, with their smudges of gamboge, sap green, Prussian blue, and staring crimson lake, and then let us be thankful to Mr. Caldecot and to Miss Kate Greenaway, with her many books, especially *Under the Window*; not forgetting Mr. Walter Crane and Mr. Henry Stacey Marks, who was, I believe, the founder of this delightful and important branch of art. When I am told that there is nothing new under the sun, these pleasant books make me almost doubt that assertion. Nature is older than the hills, and yet she is ever new; and these books prove to me that there is no end to the new ways of representing her. Our modern pre-Raphaelites—wrongly so called, or jokingly so called—when they first appeared, interested everybody with their works; they were a great feature at the Academy Exhibitions some twenty years ago. And why? because they were founded on the study of nature, not of art; were most laborious, most earnest, and full of affection for nature; they were totally unlike any other art that we had seen before; and if they in some instances appeared to us quaint, their quaintness was the result of the earnestness of the painters, and not of affectation. But when artists begin to copy from each other, and to copy from art instead of nature, then degeneration takes place. I particularly say instead of from nature; we must, of course, make every possible use we can of the art which has preceded us, and learn our lessons from it, and take delight in it, decorate our walls with good reproductions of it. We cannot always prevent ourselves from imitating, to a certain extent, those works that we most admire, but we must stamp our imitation with so much individuality that it becomes a new and original production, though suggested by the work of another. A great artist like Raphael draws straight from nature both for his inspirations and for the details of his pictures, and hence his work always reminds us of nature, accompanied with the grace and loveliness of Raphael's mind; but the followers of the master, such as certain German imitators, do not recall nature; it is true they remind us of Raphael, but they remind us that he is dead. In the exhibitions of the Royal Academy, the Dudley Gallery, and the Grosvenor Gallery, we must see that our artists are now, perhaps more than ever, inclined to go to nature direct, and to bring back for themselves what they find there, and this augurs well for the progress of art in this country. All I would ask of them is not to be so startling.

Repose is one of the first qualities that we look for in a work of art, I do not mean the absence of all action, but I mean a completeness, a unity. I remember that Frederick Walker whom many consider one of our greatest modern artists, used to say that oneness (or unity) was the great quality that he was always trying for, and that he tried to compose his pictures so that they did not look as if they were composed, but as though every figure had taken its place naturally, and as it were by accident and not by design, and yet everything even to a hand must be in its right place, and he would rub out beautiful work over and over again until he had succeeded in getting every thing into its right place, and of its right tone and right colour. Nor were his pains and his labour thrown away, for his works as a rule are the most exquisite gems. A work of art is a thing that we love to live with and to make a friend of. We do not want it to fidget us, nor to tire us, nor perpetually to remind us how clever it is, but to give us calm enjoyment or great delight and to put us into a pleasant frame of mind. Let it then, whatever its subject may be, be so harmonious that the contemplation of it gives us peace. But we see so many pictures which produce the opposite effect that one would think that one of the great objects of art was to startle. Now the characteristic of all great art is, that it leads the eye gently, as Raphael's does, or it dances it along merrily, as that of Rubens does, to its principal thought, its chief beauty and leads the mind and the heart along with it. But in order to do this, we must study the laws of composition, not that they will make us compose good pictures, but they will help us in our difficulties and enable us the better to appreciate the merits of fine works, which is really of more importance to a great many of us, than enabling us to produce perhaps only second or third rate pictures.

So we must study the art of composition. That is, the art of putting every part of a work into such complete harmony, that it seems to sing to us as we contemplate it. Or, as Mr. Ruskin more properly expresses it in his "Elements of Drawing," "Composition means literally and simply putting several things together, so as to make one thing out of them, the nature and goodness of which they all have a share in producing." Without this there is no great art. There may be very good copying, but a mere copy from nature is not always of much value unless the subject has been chosen with such taste and painted with such love for it, that the artist recognised in his subject all his laws so completely attended to, that he felt it was impossible to alter anything with advantage; but to do that he must know the laws which we shall find govern nature in a subtle way, and also all good art without in the least interfering with originality, or forcing it to be conventional, but on the contrary putting the artist into a closer and more intellectual relation with nature, and enabling him with more ease to himself (and more enjoyment to those who look at his work), to depict the infinite variety of her beauties.

We must leave this subject and leave it incomplete, with much, very much more to be said about it. A most witty and intelligent friend of mine once said to me that if ever he had to give a lecture he would choose for his subject "The uselessness of lectures upon art;" and certainly there seems to be a good deal of reason in that remark, for a lecturer cannot teach in an hour that which it takes years of daily toil and thoughtful labour to accomplish. All that a lecturer can hope to do is to call the attention of those who are interested in the subject he takes in hand, and to leave them to follow out the study of it for themselves, if they feel so inclined. In this case of the study of the Beautiful, we have but to open our eyes to the things about us, and to seek for that beauty and goodness which at first seem hidden from us, but which, when once discovered, are everywhere visible, and give an interest and value to all the objects around us that before we never dreamt of, and it is important in this respect, that the greater the number of minds occupying themselves in this manner, that is, the more the beautiful be sought, be it external beauty of form and colour, or moral beauty of love and kindness, the greater is the chance of advancement and perfection of art; for your artist, your singer, or your actor, will paint, or sing, or act, with all the more enthusiasm, and take greater pains with his art when he has a full audience before him instead of an empty house. And in these days, when men's minds are perplexed with doubts, and when the political atmosphere is thick and threatening, surely it must be a pleasant relief to turn from these things to the study of that which should teach us to turn our spears into ploughshares and our swords into pruning hooks.

THE VENTILATION, LIGHTING, AND WARMING OF HOUSES.

THE second of a series of lectures to members of building societies, on Dwelling Houses, was given at the Parkes Museum of Hygiene on Saturday afternoon by Mr. E. C. Robins, F.S.A. In his opening remarks, Mr. Robins mentioned that the necessity for as frequent a change of air in a dwelling as was practicable, without causing perceptible draught, was the guiding principle in devising or considering systems of ventilation. This renewal of the atmosphere could only be effected by the admission of fresh air and the concurrent abstraction of foul air; if either end were alone aimed at, the attempt would be more or less a failure. In ordinary houses, the chimney was a sufficient ventilator when associated with a means of feeding the chimney with a supply of air. To feed the fire directly, however, would probably prevent draughts, but would decrease the warmth of the room and leave it unrefreshed by the change of fresh for expired air. It was obviously desirable, therefore, to introduce the air in such a way that it might do all the good possible before being swallowed up by the chimney. The ordinary current of air of a sitting-room fireplace was at the rate of about 366 cubic feet of air per second, and consequently allowing 1,000 cubic feet per hour as necessary to be extracted for each occupant of any chamber, then one sitting-room fire-flue was a sufficient extractor for 18 persons; or if 3,000 cubic feet were insisted on, as recommended by Dr. de Chaumont, then six persons were provided for by this means, which was all-sufficient for ordinary purposes. Proceeding on this assumption, Mr. Tobin had the credit of reviving an old principle laid down by Mr. Whitehurst, F.R.S., and published in 1794, and of putting it into successful practice—viz., vertical ventilating shafts, set into the corner of a room and communicating with the outer air on opposite sides of the house through gratings. In introducing and extracting air without draught, practical difficulties bristled at every point, and many devices had been contrived, as they could see around them in the museum, for effecting this object. He believed it to be quite vain to think that any one system, however successful in however many instances, would, under all circumstances, realise the same results. In the first place, if shafts were used, the admission of air had to be regulated according to the wind, &c. This might be done in many ways—by a hinged lid on the top with side cheeks opening towards the wall, or by a suspended diaphragm plate. In the next place, dust and smoke found their way into the room along with the so-called fresh air. At first, perforated zinc was put into the tube, and failed; then cotton wool was lightly put over, which upset the whole principle by checking the current. The Sanitary Engineering and Ventilating Company had distinctly improved this by placing a tray of water in the horizontal portion of the pipe, and deflecting the in-current over it. But as this water would freeze in the winter time, a canvas bag, stiffened by a wire frame, had been substituted and placed in the pipe, so as to strain the air received. Double-hung raising sashes gave an in-current of air, by the familiar expedient of raising the lower sash 2in. upon a strip of wood. The same end could be effected by hit-and-miss ventilators, placed over slots in the meeting-rails of the sashes. In Currall's patent, air was admitted through the pierced bottom rail of sashes. The only other modes of introducing cold air directly with an upward current at a low level, were by Pierce's pyropneumatic, Boyd's hygiastic, and H. S. Snell's thermohydric stoves. In all cases, the in-current had not an upward tendency of more than 45°. Stevens' drawer ventilator was an attempt to achieve a vertical current from a side opening, but was not sightly. Numbers of stove-makers—Boyd, Edwards, Batty, and others—admitted fresh air through the stove-fronts, a valuable means of inlet, because of the ease with which it could be regulated, and because in winter-time the in-coming air was warmed in its passage. It was therefore economical of fuel to reject in favour of this plan any system for introducing crude cold air, as on the Whitehurst principle. Hit-and-miss ventilators had been placed in door or wall between passage and room, but had to be modified on account of the direct draught they occasioned; Currall's door ventilators were invented for this purpose, and a further improvement had been devised by Mr. Mark H. Judge, in the architrave ventilator. The lecturer expressed a preference for vertical inlets of air, and recommended that where these could not be obtained, the air should not be introduced directly, but through a flue built directly into the wall at a lower level than the opening into room. Passing on to consider extract ventilators, the lecturer said he was not favourable to Dr. Arnott's chimney-valve nor its varieties, as they easily become clogged with smoke and allowed a sooty down-draught to enter when the fire was not lighted. He preferred a separate flue for air going up between the heated smoke-flues, and so sufficiently heated to cause an upward current. This special flue should be pargetted, and should not open at the top of the chimney-stack on the same level as the smoke-flues, but through louvres on opposite sides of the stack, and 3ft. from the top. If this plan was objected

to as too costly, they might adopt the simple but effective plan suggested by Mr. Boyd 30 years ago.—viz., instead of making the withes between the flues of solid half-brickwork, to provide a hollow flue by the use of cast-iron flue-plates the thickness of a slate, thus leaving a clear 4in. space always warmed for the air passage. Ordinarily there was sufficient updaught to make these act as extract ventilators, provided an equal area of inlet ventilators existed in the room; but if these were deficient there were several simple mechanical means for creating an up-current. Kite, Howorth, Verity, Boyle, Buchan, Banner, and a host of smoke-doctors had devised cowls turned by the wind, but exhaust shafts of the kind he had recommended, ending in louvres 3ft. below the chimney tops, could not be provided with cowls, and motive power must be applied at the foot of the shaft, as in the form of the Bunsen burner gas-jet provided by Boyd at the base of the upcast shaft. Mr. Potts, of Birmingham, had attempted, with considerable but not unvarying success, to effect the introduction of fresh air and the exaction of foul air simultaneously at the upper rt of a room by a pierced cornice divided at e back by a metal diaphragm, and the outlet ue was supplemented either by a gas-jet below or a cowl above. These and other systems of ventilation were, Mr. Robins mentioned, fully described and illustrated, in a shilling book, by Mr. W. Eassie, C.E., entitled "Healthy Houses." Passing on to the subject of lighting rooms, he admitted that the softest and most agreeable mode was by wax candles; but it was too expensive except for drawing-rooms and the boudoirs of the rich. The inconvenience attending the preparation and cleaning of oil, paraffin, and other lamps had led to the general adoption of gas, which was recommended alike by cheapness, by its ready application, and by brilliancy of the light afforded. It was usually supposed, however, that gas was more destructive of oxygen than lamps or candles. This was true; but the impurity was not greater when compared with the larger quantity of light afforded. If, as Dr. Corfield had shown, instead of using five or six burners without any provision for the escape of the products of combustion, we employed fifty or sixty sperm candles, under the same conditions, there would be a fair comparison. Several manufacturers had provided for carrying the products of gas-combustion, availing themselves of the heat generated by the process for this purpose, including Messrs. Strode and Co., in their sunburners, Messrs. Benham and Sons, in the "globe" light (which had a tubular suspension-rod above, communicating with the chimney flue); a still simpler and less expensive arrangement was Messrs. Faraday and Sons' ventilating gas-pendant, and a globe-reflector had been designed by General Franzini, in which two hemispheres of crystal, one of opal, the other a bottle of filtered water, were placed round the light, which was magnified by it; a conducting tube removed the products of combustion. The same inventor had contrived the "Healthy" light, consisting of two jets blending into one flame, on a similar principle to that of the Silber Light Company. Gas-burners, generally, should be provided with some disc, or other means of checking the pressure; they should be made of some corrosive material, and should have large orifices. The lecturer expressed the belief that the electric light would soon be a household thing, and then they would have no products of combustion to think about, and no injury to furniture and frames to deplore. Proceeding to his concluding topic, that of warming, he advocated, as the end to be arrived at, the equable warming of the whole interior of the house, rooms, passages, and staircase alike. The salvation from the wasteful consumption of fuel was the withdrawal of the cause of draughtiness of rooms, the difference in temperature between the sitting-room and hall. For stoves in halls, gas might be usefully employed, as it required neither tending nor space. For rooms, he did not think we should dispense with the open fire, than which nothing could be more healthy, cheery, or wasteful; and that being so, attention should be directed towards its improvement. The primary aim must be the increase of its radiating power by reflection from heated polished surfaces. One of the best forms was where the fire-cheeks were of polished steel, set at an angle of 45° with the back of stove, and projecting in front of the fire-bars; many old-fashioned stoves were constructed in this way. The latest improvement in this way was the register-stove patented by Messrs. Comyng, Ching, and Co., called the "Paramount," in which the fire-grate was quite disconnected from the brickwork, and equally so from the metal shell or encaustic-tile lining of the chimney-back and sides, except at the bracket which supported it, thus giving free space for radiation all round, economising fuel, and allowing the stove to be carried from one room to another. The valuable series of stoves made by Barnard and Bishop, of Norwich, heated by direct radiation, and had no reflecting surfaces; the bottom of the grate was closed, causing a slow combustion of fuel, and was slightly inclined to the hearth, and the fuel was all spread out next the front bars. The depth of these stoves was generally too small, and he preferred the larger sizes, and those with bent lower bars to prevent the fuel from caking. These were not ventilating stoves, but there were many in the museum of that character, including those already mentioned, and that of Captain Galton. A new open fire-stove had just been brought out by Mr. Boyd, which was disengaged from the wall, and inclosed in a case, and had an inlet flue through the wall feeding the space under the iron hearth. Mr. H. Saxon Snell's and other hygiastic ventilating stoves warmed the air of a room both by radiation from the open fire, and by the conduction of fresh air over heated surfaces. The latest thing in economic warming was the "Lambeth Radiating Tile Stove," now being introduced by Messrs. Doulton. Mr. Robins said he should not describe the various systems of heating by high and low pressure hot-water apparatus, or by heated air and steam, as he thought, when the electric light was laid on to houses it would be time enough to lay on steam, and that then the engines required to maintain the electric current could be utilised to supply heat also.

A SANITARY PROTECTION ASSOCIATION FOR LONDON.*

By Prof. Fleeming Jenkin, F.R.S.

In the winter of 1877-78, the writer was asked to deliver two lectures on Sanitation before the Philosophical Institution in Edinburgh, and he gladly accepted the duty, believing that there would be no great difficulty in giving simple explanations on the subject, and in laying down rules so simple that each householder might easily apply those rules to his own case, and so render himself secure against the chief dangers arising from bad drainage, bad water supply, and bad ventilation. The writer holds the opinion that, while niceties of construction cannot be too warmly debated among munufacturers and engineers, they are, nevertheless, of small importance in comparison with a few very simple conditions, the observance of which will practically ensure that a house is in good sanitary order. Very briefly, these main conditions may be stated as follows:—

1. The liquid refuse from the house must have a free passage to the town sewer.
2. The air from the town sewer must not have a free passage into the house-drains.
3. No air or gas from the drainage channels of the house must enter the house.
4. No water or liquids must leak from those channels into the ground under the house.
5. The drinking-water must be supplied and stored in such a manner as to run no risk of contamination.
6. The air of the dwelling-rooms must be supplied from without, uncontaminated.

By the time that the preparations for the lecture were complete, the writer had arrived at the discouraging conclusion that its delivery would be practically useless—that it would add little or nothing to the knowledge of experts, and that the ordinary householder could not be expected so completely to master the subject as might warrant him in trusting to his own judgment when applying the principles. What conclusion then was to be drawn? Apparently, only the very lame one, that each occupier ought to call in professional advice, to see, in the first instance, that proper arrangements had been made, and from time to time to inspect whether they continued in working order. But what advice could the public obtain? The plumber and builder were interested parties, and in many cases were insufficiently educated to give sound advice. The engineer, if consulted, must be a man of standing, and would charge a fee such as would be prohibitory in the case of houses belonging to persons of moderate means. The lecturer, then, was in the position of having to tell his hearers that the water-carriage system, as it is called, had introduced into their houses a very serious danger; that the complexity of pipes and traps was such that this danger could not be guarded against without professional advice and continual inspection, and yet that no practical means existed, by which men of moderate means could obtain trustworthy professional advice. This conclusion was so unsatisfactory, that he was led to consider whether no plan could be devised for giving sound professional advice and inspection in return for small fees. The idea then occurred to him that the principle first applied by the late Sir William Fairbairn, to the inspection of steam boilers, was also applicable to the inspection of houses. An association might be formed, which should employ an engineer or engineers of their own. Each engineer so employed could inspect and report on a large number of houses annually, and if employed exclusively on this work, he would rapidly acquire great skill and experience. The writer knew that large numbers of well-educated young men, who passed through his class in the University, and through their practical apprenticeship, would be glad to give their time for about £150 per annum. If these men were to inspect houses, and report upon them under the eye of a consulting engineer of standing, the householder would have a guarantee that the principles on which the reports were drawn up, and the inspections made, were such as commanded the assent of the heads of the profession; and, nevertheless, the fee of the consulting engineer who gave this guarantee need not be more for, say, 100 houses, than he would have to charge for a single house if he were called in for that one special case.

An estimate showed that, including the payment of a secretary, rent for offices, and sundry minor expenses, the proposed benefits could be given in Edinburgh for a subscription of £1 1s. per annum, an estimate which has since been justified by an experience of three years.

The idea was explained privately to a few friends, and met with so much favour that draft rules were passed, and a circular issued.

The rules of the association were revised by the provisional committee, consisting of leading citizens in Edinburgh, and the writer was able, at his lecture before the Philosophical Institution, just three years ago, to announce that the association for Edinburgh was constituted; since that time, and under those rules, the association has worked with perfect smoothness and success. It has given satisfaction to its members; it has paid its way; it has spread widely through Scotland, and its action has in no instance given rise to any challenge or ill-feeling. Under these circumstances, the Council of the Society of Arts accepted the present paper, by which the announcement is made that a similar association is now founded in London.

The rules of the London Association are appended. They differ little from those of the Edinburgh Association, and such differences as exist have been adjusted by the London Council. The following abstract will probably be sufficient to explain what the association undertakes to do. The objects are defined as follows:—

1. To provide members, at m derate cost, with such advice and supervision as shall insure the proper sanitary condition of their own dwellings.
2. To enable members to procure practical advice, on moderate terms, as to the best means of remedying defects in houses of the poorer class in which they are interested.

The entrance fee, which entitles to all privileges of membership for twelve months, is £2 2s. for houses situated within five miles of Charing-cross, and rated below £400 per annum. The subsequent annual subscription for the same houses will be £1 1s. Special rates for larger houses can be ascertained from the Secretary.

The following are the privileges of the members:—

1. A report by the engineer of the association on the sanitary condition of one dwelling, with a sketch diagram of pipes, and specific recommendations, if necessary, as to the improvement of drainage, water supply, and ventilation.
2. The inspection of any alterations in the sanitary fittings which may be carried out by the advice, or with the approval, of the officers of the association.
3. An annual inspection of premises by the engineer, with a report as to their sanitary condition.
4. Occasional supplementary inspection and advice concerning the dwelling or property in respect of which he is a subscriber, whenever this advice may be desired. The fee for such occasional advice will be fixed from time to time by the Council.
5. Reports by the officers of the association as to the

*Part of a Paper read before the Society of Arts, Jan. 12.

sanitary condition of any dwellings or properties designated by any member, or on any plans for proposed buildings, on payment of a fee to be fixed by the Council from time to time, with special relation to the rent, or estimated rent, of the premises.

6. A vote in the election of the council, who manage the affairs of the association.

Any member is free to leave the association at any time; non-payment of the annual subscription will suffice to cause the removal of his name from the roll. The association has no share capital and no profits. The Board of Trade has signified their willingness to license the Edinburgh Association as one of public utility under the Act of 1867, Victoria 30—31, c. 131, and the Board will, no doubt, be prepared to grant an equal priviledge to the London Association.

The council of the association will, by its articles, be unpaid; the officers have no interest in any outlay or patent

The first council will be constituted as follows:—President, Prof. T. H. Huxley, LL D. F.R S., &c. Ordinary Councillors, J. S. Bristowe, M.D., President of the Society of Medical Officers of Health; Sir Wm. Gull, Bart, M.D., D.C.L.; Rev. Harry Jones, rector of St. George's-in-the-East; Hugh Leonard, late Engineer-in-Chief, Bengal Presidency; F. Clifford de Lousada, retired commander R.N.; Sir W. Tyrone Power, K.C.B.; E. C. Robins, F.R.I.B.A.; J. S. Burdon Sanderson, M.D., LL.D., F.R S.; Sir Henry Tyler, M.P.; Prof. Alex. W. Williamson, F.R.S., &c. Honorary Standing Council, Alfred Wills, Q.C. Honorary Treasurer, T. Holmes, M.A., Cantab., Surgeon, and Lecturer on Surgery at St. George's Hospital.

The following will be the first paid officers of this association, holding office at the will and pleasure of the Council:—Consulting Engineers, Fleeming Jenkin, F.R.S., M.I.C.E., Professor of Engineering in the University of Edinburgh and Consulting Engineer to the Edinburgh Sanitary Protection Association; and H. C. Forde, M.I.C.E. Resident Engineer, W. K. Burton. Secretary, Cosmo Innes, M.I.C.E., 6, John-street, Adelphi.

A short account will now be given of the manner in which the system is practically worked. A householder or tenant who thinks of joining the association will write to the secretary, Mr. Cosmo Innes, at 6, John-street, Adelphi. In his letter he will state the nature of the premises in respect of which he wishes to subscribe. He will mention the rateable value or actual rent, and the situation of the house. If the situation be within five miles of Charing-cross, and the rateable value of the house under £400, he will know that the terms of the subscription are £2 2s. for the first year, and £1 1s. for each subsequent year. He may either ask the secretary for further information, or he may at once signify his intention of joining the association as a member, and inclose a cheque for £2 2s. He may, if he pleases, call and obtain verbal information from the secretary. When a member joins he incurs no liability, except for the first two guineas. He may or may not pay any subsequent annual subscription; but it is hoped that most of the members who join will remain members of the association, since otherwise they will not receive the full benefit of the scheme. As soon after the member has joined as circumstances allow, the secretary will write to the member, and inquire when it will be most convenient to him to have his house inspected. When the inspection is arranged, the member will be asked to let his plumber to meet the inspecting engineer, and also to have the ground opened up in such a manner as to expose the main drain of the house at some point between the house and the town sewer. If the extra expense which this entails is objected to, the inspection cannot be thorough, but may still be useful. The sums paid for opening up the ground do not pass through the hands of the association. Unless some grave defect is discovered in the drain under the house, the opening up of the drain, being done outside the house, need cause no inconvenience to the inmates. The engineer inspects the condition of the main drain, and, assisted by the plumber, takes notes of every pipe, trap, and sanitary convenience in the house; he makes inquiries as to smells and ventilation; he examines all cisterns and arrangements for water supply. When this is practicable, he tests the condition of the pipes by pouring paraffin, or some other volatile strong-smelling substance, into the drainage system from the roof. If the smell can anywhere be detected inside the house, a flaw is thereby indicated; this is then laid bare. As soon after the inspection as may be, the member receives a detailed report, describing the condition of his house, accompanied by a sketch diagram showing every pipe and trap; recommendations for improvements are made when necessary, as is usually the case, and some rough estimate can be given of the probable cost of those improvements when this is desired. The improvements recommended are those only which are shown by every-day experience to be necessary. The wishes of the occupier are taken into account, and the more important are distinguised from the less important alterations. The recommendations made are sufficiently specific to enable the member to obtain an estimate from his plumber or builder of the cost of carrying them out. The cost is often considerable, but the member may feel assured that the association has no interest whatever in recommending any expenditure.

The interest of its officers is in the other direction. The less that is done to a house the less trouble they will have. The less that is done the more popular the association will be. It is, however, only fair to state that, in the great majority of cases, subscription to the association leads to an outlay in the first year largely in excess of the two guineas. This outlay does not pass through the hands of the association. If the member decides to carry out the recommendations made, or any of them, and gives the secretary notice of his intention, arrangements will be made to inspect the work when completed, or nearly completed. This inspection of the plumbing and other work is one of the most valuable privileges which the member obtains by joining the association. When the alterations have been satisfactorily completed, the member can, on application, obtain a certificate as to the sanitary condition of his premises. This certificate will be of great value to hotels, lodging-houses, and schools. The recommendations made to members invariably include such arrangements as will preclude the necessity for ever again incurring expense in opening up the drain for inspection.

At this point the writer feels that probably all present believe more has been promised than can possibly be performed for the money. This feeling will not be least strong among those best qualified to give an opinion. The writer can, however, speak with the authority of complete experience. It has been shown that these services can be rendered in a thorough and efficient manner, by one resident engineer, for 450 houses or even 500, in one year. The reports, sketch diagrams, and letters in Edinburgh are open to the inspection of all whom it may concern. During three years there has not been one case of complaint that the houses were not thoroughly examined, or that the reports were not sufficiently detailed. At the annual meeting, member after member has risen to express his sense of the thoroughness of the work, and Scotsmen are not easily deluded or even satisfied on this point. At the outset the writer could only plead his own conviction that the work could be done. He is now able to say that, in 1,200 cases, it has been done.

The second inspection is a much simpler matter; when the guinea for the second year has been paid, the resident engineer visits the premises, assures himself, by ocular inspection, that there is a free outfall of sewage; paraffin or its equivalent is again poured into the drainage system, and a thorough search made for dry traps, broken joints, or worn-out lead. If the pipe under the house has been laid afresh, in accordance with the association's specification, it is tested, to ascertain whether it remains watertight. Inquiries are made as to any alterations which may have been made since the last visit. The condition of the cisterns is examined. The member then receives a second report, in accordance with the facts of the case. This practical and experimental inspection is repeated year after year; it entails no cost beyond the guinea, and no inconvenience. It renders the member practically secure that no imperfection in the drainage system can remain long undetected. More frequent inspections could be arranged for at cheap rates, in special cases, such as schools, where injuries are more likely to occur. The association, therefore, does not appeal only, or even mainly, to those who have reason to believe that there are grave defects in their houses. Its chief business begins when the house is in good order. The householder is then in a position analogous to that of a manufacturer who has bought a good steam-boiler; he knows that the apparatus is good, but liable to decay and derangement; he employs the principle of co-operation to obtain skilled supervision to protect him from the consequences of that decay or derangement. A less measure of inspection than is offered will not protect a house from the dangers inseparable from the system of water-carriage for sewage.

There are other minor functions which the association will fulfil.

It will examine plans of projected buildings for architects and builders. This provision is taken advantage of to a considerable extent in Edinburgh.

The association will also examine houses for persons who propose to take them on lease, or for landlords who propose to let houses.

If a member desires a report on the condition of some other premises than his own, such as lodgings occupied by the poor, a report will be made at moderate rates, as a matter of special arrangement. All these reports are strictly private and confidential.

All the objections raised in Edinburgh experience has shown to be of no value, but there remains one objection which will always be serious. Persons shrink from becoming members because they fear that by enrolling they will be led to expend a considerable sum of money in sanitary improvements. "I do not mind the two guineas," they say, "but I shrink naturally from the fifty guineas which this may entail." The objection is valid, but yet it sounds strange when it is urged by a person who says, "I know my house is in very bad order; it was built long ago; rats abound; smells pervade, and we are much troubled by sore throats." What expenditure of money is justifiable if not that which tends to secure good health? No doubt the hesitation is partly due to a doubt whether the sanitary engineer really knows anything at all about the matter. The association does its best to remove that doubt; the reports explain what is wrong, why it is wrong, and what will put it right. The member is left to his own common-sense as a guide whether he will follow the recommendations made. It is a matter of no pecuniary interest to his adviser whether the job is done or not, and that adviser is selected and watched by a council consisting of men as well qualified for this purpose as can be found in London.

CHIPS.

Mr. Nicholas Little, of the firm of Little Bros., of Dungannon, builders and contractors, was killed on Saturday, while superintending the building of a new steam-packet wharf wall at Dundalk quay, for which his firm were the contractors. Stones from the débris of the wall were being raised in a bucket worked by a derrick, when the iron jib snapped, and fell upon Mr. Little's head.

The annual meeting of the Walsall School of Art was held on Monday evening, when a report of a satisfactory character was read, and the prizes and certificates were distributed.

The town council of Halifax received last week a report from the gas-committee, recommending that a new gas-holder be constructed at Stoney Royd, and that Mr. Carr, the gas-engineer, be employed to prepare the necessary plans and specifications at a commission of 2½ per cent. The gas-holder would be on brick foundations, would hold 1,500,000 cubic feet of gas, and was estimated to cost £15,000. The report was adopted, after an attempt by a minority of the council to invite some one else to prepare plans.

A stained-glass window has just been placed in the parish-church of Old Buckenham, Norfolk, as a memorial. The subject is the parable of the "Good Samaritan," and the work was executed by Messrs. J. and J. King, of St. Andrew's, Norwich.

The new Oxford University Boat-house, erected from designs by Mr. J. O. Scott, on the Berkshire side of the river below "Saunders' Bridge," which was with n a fortnight of completion, and which we illustrated on July 16th last, was burnt to the ground on Saturday night, together with some 30 or 40 eight-oared and other boats belonging to the University and the colleges, which had already been housed there. The contractors (Messrs. Silver, of Reading), were insured for £1,500; but the building had cost about £2,500, inclusive of the concrete foundations, which are uninjured.

The management of the London office of the Gateshead Stained Glass and Art Pottery Companies has been taken up by Mr. E. E. Pither, who is already well-known among architects and builders. The office, 53, Mortimer-street, Cavendish-square, has been converted into an art studio, comprising in addition, samples of stained glass and art pottery, tapestries, hammered brasses, &c.

At the general meeting of the diocesan board on the 10th inst., Mr. John D. Sedding, of 18, Charlotte-street, Bedford-square, was unanimously elected as diocesan architect for Bath and Wells.

Reopening services were held in Darnall parish-church, near Sheffield, on Thursday, the 6th inst., after the rebuilding of chancel end, from the designs of Mr. E. Eldon Deane, of London.

OUR LITHOGRAPHIC ILLUSTRATIONS.

SALL CHURCH, NORFOLK.

We have reproduced these drawings of Sall Church, by Mr. T. C. Yates, in order to illustrate Mr. R. C. Pink's lecture on Norfolk churches, delivered last Friday before the Architectural Association, and reported to-day by us on page 35. This fine building is an admirable example of Norfolk parish-churches of the larger type. The plan is cruciform with the rather unusual arrangement in so large a church of an aisleless chancel. The stalls in the choir return on the west side, and a fine screen remains. The transepts are rather small in size, and a porch with parvise over is provided on the north as well as on the south sides. The arch into the tower is a splendidly large and well-proportioned example, and the richly-carved and massive hoist supporting the font-cover is almost unique. The benches throughout the church are original, and the roof is one of the finest in the county. The church is unrestored, and in a most neglected and dilapidated condition.

THE CHATEAU OF ST. GERMAIN EN LAYE.

The sketch is of the N.E. façade, which looks out upon the forest and the great terrace of Louis XIV. The N., S., and E. wings of the building—the work of Francis I., as reconstructed by Henry IV.—have now been almost entirely remodelled by the restoration still in progress. Only the entrance front remains untouched. The workmen are at present engaged on the Cour d'Honneur of Francis I. and the chapel of St. Louis. The sketch shows two of the four pavilions built by Mansard, in the reign of Louis XIV. The donjon was the castle of Charles V., and is the earliest work at St. Germain, no remains of the still earlier fortress being now traceable. The buttresses, which were brick in the original work, have been everywhere rebuilt in stone. The wall-surface is finished in plaster of a colour which goes well with the brickwork. Throughout the building the upper part of the cornices are constructed of stone and the bed mouldings in brick.—JAMES. B. STEWART.

BOLTON INFIRMARY.

The new infirmary at Bolton, which we illustrate, was commenced in the spring of 1879, and, in all probability, the building will be ready for occupation by autumn next. The infirmary consists of four distinct buildings—viz., the administrative block (which is placed in the centre), the right and left pavilion, and the Children's Hospital (at the back of the left pavilion). The corridors connecting them are one story only in height, so as not to interfere with the free circulation of air. The administrative block contains on the ground-floor the principal entrance-hall, board-room, secretary's office, matron's and surgeon's day-rooms, operating-room, and small occasional ward, also the kitchens, larders, servants' hall, lavatories, &c. The upper floors are appropriated for surgeon's, matron's, nurses, and servants' bedrooms, with requisite bath-rooms, &c., the plan being so arranged that each department is kept thoroughly distinct. In the centre of the front, over the entrance-hall, a tower is carried up to a total height above the ground of 103ft. The upper portion of this could be utilised for water tanks. The right pavilion (that nearest the tower) contains the entrance for patients, with its accident-receiving rooms, &c, also the dispensary and out-patients' departments. The latter consist of a large waiting-room, also medical and surgical, consulting, and examination rooms, lavatories, &c. The house-porter's apartment is placed here, and is in such a position as to control both the entrances. A small ward, capable of taking three beds, is also placed on the ground-floor. On the upper floor is a large ward for 14 beds, and a smaller one for three beds; also nurses' day and night rooms. The left pavilion has on the ground-floor a large ward for 14 beds, and two occasional wards for three beds each, also nurses' day and night rooms. The upper floor is similar, but with only one small ward. Both the pavilions have balconies at the end for the use of convalescents. The children's hospital, which has been placed so as to overlook the park, is a one-story building, containing two wards for eight beds each, a recreation ward or play-room, lavatories, &c., also nurses' day and night rooms. A terrace is provided, communicating with the wards for the use of convalescents. These wards are so arranged that they can be completely isolated from the main building. The sizes of the wards are as follows:—Large pavilion 59ft. by 27ft., cubic space for bed 1,820ft.; small wards 22ft by 16ft. 6in., cubic space for bed 1,377ft.; children's wards 35ft. by 26ft., cubic space for bed 1,700ft. The total number of beds is as follows:—Men's wards, 42 beds; occasional wards, 17 beds; children's hospital, 16 beds: total 75. The principal corridor extends from end to end of the building, with a total length of about 300ft. The pavilions are provided with hydraulic lifts for patients, and hoists for raising dinners and coals to the upper stories. Shoots are also provided for dirty linen, dust, &c. Fireproof construction has been adopted throughout. The heating of the wards is by Hayden's system of central fireplaces, which combine open grates with hot air and ventilation. In these and in all sanitary matters the most modern improvements have been adopted. The materials employed are brick, with Yorkshire stone dressings, and the roofs are covered with green slates from Elterwater. The amount of the contract is £19,250. The tender of Messrs. J. H. and G. Marsden, builders and contractors, of Bolton, was accepted. Mr. R. K. Freeman, of Bolton, is the architect.

OLD HOUSES, CHRISTMAS-STREET, BRISTOL.

To the lover of that style of domestic architecture which finds its expression in forms of timber and plaster, the ancient city of Bristol affords many excellent examples, provided he does not object to explore some of its narrowest streets. The accompanying sketch is an example which, from its simplicity, rather than from its display of elaboration, arrests the eye of the passer, and claims his attention before he proceeds to mount the Christmas steps. The adjoining property, though externally of no architectural importance, and only marked by the label of the 15th century archway, leads to the remains of an historic building, the hospital of Bartholomew's, which dates from 1220; it was purchased by one Robert Thorne eight years before the dissolution of monasteries; he there founded the Bristol Grammar School, which, however, has since, on two occasions, been removed to different sites. The "steps" alluded to, and of which the commencement appears in the sketch, lead to the higher part of the city; on either side are old houses, entered from the landing-stages which occur at intervals. On reaching the top and turning round the *coup d'œil* is particularly impressive. At this point, on both sides, are curious stone *sedilia*; those on the right, under the chapel of the Three Kings of Cologne (1481), bear a mutilated tablet with inscription informing the reader when, and under what auspices, the steps are formed; the date inscribed is 1669.—J. A. S.

OLD HOUSE, ST. PETER'S CHURCHYARD, DERBY.

There appears to be little known about the history of the very interesting old house of which we give an illustration; but so far as we have been to make out, it was built about 150 years ago by a Mr. Jackson, as a private residence. It, however, passed out of his family for some years, and was used as a school. Since the sketch was made, it has unfortunately been mutilated by the destruction of two orginal gables at the sides, and substituting projecting eaves. We have upon one or two previous occasions given illustrations of other old houses in Derby, but this is almost the only perfect specimen now remaining.

THE INSTITUTION OF CIVIL ENGINEERS.

MR. JAMES ABERNETHY, F.R.S.E., the lately-elected president, delivered his inaugural address on Tuesday evening. After referring to his own long connection with the society, Mr. Abernethy proceeded to give a sketch of the state of harbour and dock engineering, his own branch of the profession, in 1848-50, as contrasted with the developments of the present day. In the 30 years referred to the accommodation for shipping afforded by the 18 principal ports of Great Britain had increased from an average water area of 46 acres to one of 107 acres, and the depth available at high water of spring tides from 23½ft. to 29ft. The principal cause of this great development was to be ascribed to the increased number and dimensions of ocean steamers, which had advanced from the Atlantic wooden-paddle steamer of moderate dimensions in vogue in 1850 to screw steamers built of steel between 500 and 600ft. long, and with engines up to 10,000 horse-power. Turning to the Continent, the most notable increase in dock accommodation was to be found in the Low Countries; but France, Spain, Austria, and Russia were all carrying out important works in this direction. India and the Colonies were also engaged in like enterprises, notable among which was the nearly completed harbour of Madras, which would be finished during the present year, and would afford a safe and commodious water area of 200 acres in place of the present exposed roadstead. The great rivers of the United States rendered docks less imperative in that country than elsewhere, but the Government were carrying out improvements in the mode of access to the rivers by dredging and training the banks. Reverting to this country, it was to be regretted that the canal system had been suffered to fall into neglect, as with improved means of working the locks, the use of steam-power for towing, and protection of the banks, they would still constitute valuable accessories to the railways, especially for the carriage of heavy goods. The value of inland navigation was fully recognised by the Dominion of Canada, which would shortly possess one of the most extended systems of waterways in the world suitable for sea-going steamships, and affording great facilities for the conduct of traffic between the Western parts of the Dominion and of the United States, and Quebec, Montreal &c. The advantages derived from the Suez Canal had been very great, but Count de Lesseps' new enterprise at Panama would, if carried out, be even more beneficial to the world. The chief difficulty in the way of its successful execution was the provision of the safe means of discharging the land-water in times of flood. The means proposed were explained by Mr. Abernethy, who referred to the rival scheme by Nicaragua. The question of floods was attracting attention in England, where an improved system of drainage in the Midlands had so facilitated the quick passage of the rainfall, that the ordinary river-beds were no longer sufficient, and their overflow in the winter was becoming chronic. The most appropriate of remedies were suggested by the President, who, in concluding his remarks, claimed that the members of the Institution and of other similar bodies had not been behindhand in carrying out works tending to "direct the great sources of power in nature for the use and convenience of man."

OLD HOUSE St Peters Church Yard DERBY

PONTEFRACT AND ITS TOWN-HALL.

[FROM A CORRESPONDENT.]

THE Corporation of Pontefract for the last four or five years have had almost continual discussion at the periodical meetings with respect to the insufficiency of the town-hall for present requirements, especially for concerts, balls, and public meetings—the principal hall (and the largest in the town) only being capable of accommodating about 450 persons. A few months ago the council so far promulgated their desires as to order advertisements to be inserted in this and other papers for competitive designs for additions only to the old building, and, in answer to the invitation, no less than 59 sets of plans were submitted from all parts of the Kingdom. After a meeting or two a hard-and-fast bargain was made with Mr. Corson, of Leeds, "to assist" in selecting the most suitable design compatible with the stipulated amount, viz., £7,000, to include the architect's commission, and on the last day of the year his award reached the committee, giving, we understand, the first premium of £50 to the plan motto "Straight and True," and the second prize of £25 to motto "1880"—the names of the architects, of course, not yet discovered, and there were two designs sent in with the motto "1880." The corporation on Thursday evening held a special meeting on the subject, and also to take into consideration a requisition signed by eight members of their body "to rescind all resolutions that had ever been passed by the council with reference to the new town-hall, which recognised the indispensable condition that the present hall shall not be pulled down or interfered with, and to pass a resolution that the new town-hall be built upon the site of the present hall and such other properties as may be necessary." An ex-mayor supported a motion in favour of the requisition, arguing that no alteration to the old building would be satisfactory if not pulled down, the ground cleared, and important street improvements carried out in the immediate neighbourhood. He would support such a scheme or would let the whole thing drop till such times the ratepayers could better afford to spend the money. Another member, in opposing the resolution, reverted to the last five years they had had the subject under discussion, and said if the motion was carried it would take another five years to talk the town-hall back, to say nothing of being the laughingstock of the whole of the West Riding of Yorkshire; he further argued that the sum of £6,000 would erect a very creditable building suitable for all purposes required, and if they pulled the old hall down and made some street improvements, the building alone would cost £25,000, and he knew that the gentlemen who signed the requisition were divided, some not wanting any money laid out at all, whilst others would be prepared to support an enlarged scheme of entire new building and street improvements. Seven gentlemen composed the original committee, and in their report they had recommended eight schemes and sites for consideration, one gentleman adopting two! Mr. Corson, of Leeds, had previously given them the cost and report upon these eight schemes. Another member showed that the corporation had already committed themselves to over £3,000, for the purchase of additional property adjoining the present hall, and were arranging for another property of £2,000 and that the building as proposed (even if, as the committee intended, they did a lot of chopping off the stone front and substituted brick with stone groins) would cost £11,000 or £12,000. The resolution abandoning the work was carried after a long and heated debate by 12 to 7. We should also state that nearly three years ago some of the principal inhabitants of the town and neighbourhood privately collected about £3,000 towards this building and have handed the amount to the corporation. As soon as the council had finished the first division, a motion was made that this money should be returned to the donors, but was negatived by 11 to 10 votes

---

The *Pontefract and Castleford Express* of Saturday last says: "We really cannot say how many times the corporation of Pontefract have tried to overcome the many obstacles which they supposed stood in their way of accomplishing the erection of a new town-hall; but certain it is that a great number of resolutions and counter-resolutions have been passed with reference thereto, until at length the public are wearied with hearing of the unseemly bickerings and personalities continually indulged in whenever the scheme is brought before the council. Were this all, perhaps there would not be much cause for comment; but when, after two and a half years' consideration, the purchase of valuable property, the advertising for plans for the proposed building, the response of about seventy architects, the exhibition of these plans in the Vicarage, and the recommendation of one of them by an eminent architect, the whole scheme is finally rejected by a majority of twelve against nine, there is indeed cause for inquiry how and why all this has been brought about. The mere collapse of the scheme would be of small moment were it not for the loss of time and money involved, and for which the ratepayers will have to suffer; but it also tends to shake the public faith in the business capabilities of those who represent the interests of the town. The handsome sum of nearly £3,000 promised towards the proposed hall should have led to something very different from what has been constantly brought before the public, and, if there had been any difficulty as to the site and structure, the ratepayers should have been at first consulted, and the feeling of the borough ascertained as to the necessity or otherwise for a new hall. We believe it to be the general feeling of the ratepayers that it should be carried out thoroughly, and with a view to the improvement of the town, or not at all. Although the resolution to abandon the project was carried on Thursday evening, it is almost certain that those who wish to erect a hall on the site of the present one will make another attempt, and we have good reason for believing that it will meet with success. With regard to the resolutions not to proceed with the building, we are of opinion that it was not competent to put such a proposition at that meeting, but that, according to the rules of the corporation, a special meeting must be convened for the purpose before this can be legally done. The town clerk was not appealed to as to the validity of the resolution, or in all probability it would not have been passed. We hope that, should the scheme be again brought before the Council, minor differences will be sunk, that personal feeling will have no sway, that the general welfare of the town will be considered, and then we shall have no fear for the result."

DAMP WALLS.

FOR several weeks past a good deal of correspondence has taken place in your paper respecting dampness coming out on the surface of walls. None of the answers that have appeared are altogether satisfactory. I have had considerable practical experience in the matter, and have written down the result of long and careful investigations on an important estate of the causes and remedy, and I can confidently say, if the inclosed rules and suggestions are acted on, no one need be troubled with this nuisance.

The cause of water or dampness settling on the walls of rooms is easily explained and remedied. Many valuable engravings, water-colour drawings, furniture, and decorations are permanently spoiled by repeated saturations from condensed vapour; and often work is supposed to be badly done, or the furniture not well made, when affected by this cause, for it does not always exist to the extent of being visible on the surfaces of the room.

Substances which are very soluble in water often attract water from the atmosphere to such an extent as to form a solution; as, for instance, distemper: and some organic substances, such as wood, have the same property of attracting water. Water evaporates at all temperatures when in contact with atmospheric air or other gases, and the vapour thus formed has a density and tension determined by the temperature. This evaporation takes place only from the surface, and, to an extent proportionate to the volume, temperature, and dryness of the air, with which the water is in contact. In a confined space this evaporation ceases, when the air becomes saturated with water-vapour; in the open air it proceeds more rapidly in proportion to the extent of surface exposed, and when the air which has become saturated with vapour is constantly replaced by fresh air. Consequently, a current of fresh air favours evaporation.

To obtain a current of fresh air in a room where cold air has collected, and to prevent condensation, a fire should be lighted, which will gradually draw off the cold air, and at the same time dry a small portion of the air, which rises to the ceiling, forcing the denser air down; when a sufficient time has elapsed for the room to become thoroughly warm, the gas may be lighted. Water is formed whenever hydrogen gas, or a combustible substance containing hydrogen, is burnt in oxygen or atmospheric air. If the gas is lighted before the room is warmed, the vapour formed by the gas is condensed by coming in contact with the cold walls. If the walls are papered, a great amount of condensation is absorbed; if they are distempered with any colour containing blue or dark green, they become quite black, but if the walls are painted none of the moisture is absorbed, and the water collects on the surface in beads which eventually run into each other and stream down the walls. Water is a very efficient solvent, so much so that there are a very few substances, solid, liquid, or gaseous, which are not to some extent capable of being dissolved by it. Many substances, however, can be dissolved by water only in such minute proportions, that for most purposes they may be regarded as practically insoluble; among which are oil-paints, but if earthen pigments are mixed with them as ochres, siennas, &c., they are easily affected by repeated saturations unless well protected by varnish. Walls painted with a large admixture of these colours soon become discoloured by dampness. Some are readily soluble, and require only small proportions of water, others but sparingly soluble; generally the solubility of any particular substance is increased as the temperature is raised. In the case of distempered walls a very slight rise in the temperature is sufficient to cause the water to penetrate the gelatine or size with which it is composed, and which the water has the property of abstracting, leaving a soft loose powder which comes off with the slightest touch.

If a fire is undesirable, as in rooms used only at night or for a short time, the gas should be lighted some time before the room is wanted, and the top sash of the window drawn down a few inches to enable the vapour formed by the gas to be carried off by the heated air. Even if there is a ventilator in the centre of the ceiling it will be necessary to lower the sash, the moisture forming very rapidly on first lighting the gas; after a time the window may be closed.

A good ventilator "as suggested by Dr. Hinks Bird" may be made in any room, with the expenditure of a few shillings, by placing a piece of wood three or four inches deep at the bottom of the window-frame between the beads. The bottom sash may then be raised, and a space is formed at the meeting rails of the two sashes, allowing the fresh air to curve in the direction of the ceiling. I have several times seen this simple ventilator working very successfully.

A. GREYSMITH.

ANNEXE TO THE CHARING CROSS HOTEL.

A CONSIDERABLE addition has been recently made to the Charing Cross Hotel, in the shape of an independent annexe, forming a large and lofty block of building between Buckingham and Villiers-streets. The new building covers an area of nearly 7,000 square feet, and is connected to the main hotel by a light iron bridge crossing Villiers-street. It contains about 130 apartments, these being chiefly approached by corridors. We wish more particularly to draw attention to a few special features in the construction of the building, and particularly to the flat roof and floors which we have inspected. These are constructed on the excellent fire-proof principle of rolled iron joists and concrete known as Dawnay's system. The roof, between six and seven hundred square feet in area, is covered with asphalte ¾in. thick, laid by Claridge's Patent Asphalte Company, and is a most perfect piece of work of the kind. The rolled joists about 3in. × 1½in. are supported on iron girders or binders 7ft. apart, and these carry the bed of concrete, upon which is laid the asphalte in the usual widths. A good fall is obtained on each side of the roof to the parapets, and the flashing round these is formed of slabs of Claridge's asphalte, placed upright under a projecting coping of stone. Against the chimney

stacks, which rise through the roof, a similar asphalte flashing is introduced, bedded beneath a projecting course of brickwork so as to form a drip. Nothing can be more secure than this kind of flashing, which has a far neater and more architectural finish than lead, forming, as it does, a sort of skirting. The asphalte, as applied to these skirtings, and some work at about an angle of 45° over the stair bulkheads, presents a very neat appearance, and bears evidence of careful execution, which no other than skilled labour of the highest class could have produced. The flat roof thus covered will form a promenade for smokers in summer time, and the view commanded, the building being six stories high, is extensive. The staircase is worthy of remark as an application of Portland cement concrete; the steps are cast in moulds, and their soffits thus treated produce an effective appearance below. The treads are covered with slabs of Portland stone, and the risers have red tiles.

The elevations are plain and unpretentious in style; yellow brickwork, with Portland cement dressings, are the principal materials used, except in the ground story where Portland stone is substituted. The works have been carried out from the designs and under the direction of Mr. John Fish; the contractors are Messrs. Lucas Brothers, and the foreman Mr. George Baker. The estimated cost is about £40,000.

EXPERIMENTS ON VENTILATION AT THE CUSTOM-HOUSE.

LAST week we referred to the system of ventilation, known as that of Messrs. Boyle, which has been applied to the Long Room of the Custom House, and we then remarked upon the decided success of the system as far as we had opportunity of examining the action. Since then a series of experiments have been conducted to test the efficiency of the system, extending from the 5th to the 9th instant, in the presence of several eminent scientists, among whom were Dr. B. W. Richardson, Capt. Douglas Galton, C.B., F.R.S., Professor Corfield, Sir J. B. Monckton, Rogers Field, C.E., Baily Denton, C.E., A. Murray (City architect's office), Ernest Turner, and some others. The room, we may add, is 194ft. long by 64ft. wide, and 54ft. high, and is lighted by 200 large Argand burners, fixed at about the level of the head. When the gas was lighted the heat and sulphurous vapour was unbearable to the occupants. The heating apparatus consisted of two large double open-stove fires in the centre of the room, and the number of clerks employed is about 140. We have only to add to our description last week the results of the experiments made in the iron shafts leading from the ceiling to air-pump ventilators on the roof, there being six of these, each of 3ft. diameter. For admission of air, twelve vertical tubes, each 10in. by 8in., in the window bays of the south side, have been fixed, the outer air-openings being in the centre of each bay below the windows. On Wednesday the air-pump ventilators were tested, and were found to be extracting at the rate of 800 cubic feet per minute, or a total, for the six ventilators, of 4,800 cubic feet. The wind was N.E.E., putting the ventilators to a severe test, as the inlets are on the south side. On Thursday morning the ventilators were extracting 900 cubic feet per minute each, or 5,460 cubic feet altogether. Dr. Richardson tested them at 4.45 on the same day, the total extraction for the six being 8,085 cubic feet with wind in the same quarter. Professor Corfield and Mr. Rogers Field on Friday conducted similar experiments, the velocity of the outgoing air being 612½ cubic feet per minute, or a total of 3,675ft.; wind, N.E., fluctuating; average speed being 525ft. On Saturday the experiments showed an extraction of 595ft., or a total of 3,570ft., the wind being N.

Mr. E. Turner's experiment of closing the inlets was a severe test to the power of the ventilators. Even under these unfavourable conditions with fires burning in the room, drawing air towards them, a difference of only 25ft. per minute in each ventilator was found. The inside temperature recorded was 60°, and the outer 40°. On Monday also, when a foggy atmosphere prevailed, the ventilators acted freely, and the long room was quite clear of the fog—a condition of things which contrasts favourably with former experiences. Those present at the experiments were highly satisfied with the results obtained under such trying conditions of wind and weather. We understand that Messrs. Boyle and Son are about to ventilate the Council Chamber of the Guildhall. The works at the Custom House were carried out under the superintendence of Mr. R. McLeish, clerk of works of Her Majesty's Office of Works.

WEST LONDON SCHOOL OF ART.

THE large room of the new building in Titchfield-street, W., recently built from the designs of Mr. R. W. Edis, F.S.A., for the use of this school of art, was crowded on Wednesday evening, on the occasion of the annual meeting for presentation of prizes. Mr. J. Comyns Carr presided. The report, read by the recently-appointed head-master, Mr. John S. Rawle, F.S.A., late of Nottingham, showed that notwithstanding the great disadvantages of a change of masters and removal of the school during rebuilding, the school had maintained its high position. It was now the largest of the ten metropolitan schools, and had last session 580 students—198 morning, and 372 evening; while the total number in London schools was 2,650. The fees and subscriptions both showed a substantial increase, and the successes at South Kensington examinations had been greater than previously—the gratifying results of the work of his predecessor, Mr. George A. Stewart. Mr. Richatson, one of the senior students, then presented to Mr. Stewart, on behalf of the assistant masters and pupils, a handsome clock and a purse of sovereigns, as an expression of the esteem and regard for one who during the twelve years he had held office, had shown himself a most excellent and successful instructor, and a sincere friend to the students. The chairman added an expression of sympathy and regret that Mr. Stewart should have been compelled to resign on account of the greatest affliction that could come upon an artist, threatened failure of sight. Mr. Stewart having replied, the treasurer's report was read by Mr. W. Graham, and was of a satisfactory character. He urged the students to submit all their work for examination; had they done so last year, the school would probably have earned an increase of from £60 to £70 in the Department's grant. However, the school had taken in prizes about one-fourth of the total awards made to the Metropolitan schools.

Mr. Comyns Carr then delivered an eloquent address to the students. As he was not a practical artist, but only one who had thought and written on art, he felt, he said, some hesitation in addressing them, but he should confine himself to general principles, and not venture to deal with technical principles. Nor, indeed, was there any need for him to dogmatise on practical matters, for they had evidence in the prizes before them that their instructions had been well done, and their new master came with excellent testimony from his predecessor that this would be continued. There was a danger, moreover, that technical education should degenerate into mere handicraft, and they needed to conbine with cunning of hand, mental labour of high quality, or it became useless. He, therefore, felt it not unbecoming in a mere writer on art to address them, the more readily because all writers on art at times, and some always, had much to answer for, for having enunciated platitudes. First of these misleading platitudes he should endeavour to controvert he would place the dangerous theory that it was necessary for students of the 19th century to make a new departure in art, so that they could only be successful in so far as they were "original." This originality was the pet vulgarity of the age. No such originality was possible to art. The greatest men in all ages had been those who had had most reverence for the past, and had studied its work most carefully, and they had always acknowledged their indebtedness to those who had preceded them. Art in itself was not new; it was in its essence as old as the world. There was another danger more subtle in nature than the first, because occasioned by persons of higher authority. Students were constantly urged to do something in sympathy with their own age. It was too soon for us to dogmatise on what the spirit of the age was; only those who came afterwards, and could look back dispassiontely on the whole course of the age, could justly define its special character; but he believed that in proportion as they were imbued with a respect and reverence for the best work of the past, so would they most truly be *en rapport* with the spirit of the age. Compared with Italy, we were almost children in art; we had had a great race of painters in the immediate past, as there had been a greater race of architects in a still further past, and what had been could be. There was apparent what promised to be the beginning of an English school of art, but what its characteristic product would be could not be ascertained by analysis; it would reveal itself in after-time as the result of our earnest labour and thought, brought about by slow training, by long study, by generations of successful masters who worked each on the foundations laid by their predecessors. They ought not, therefore, because they could not predict what local form an art would take, to be discouraged or disappointed; nor because we admired and copied the great works of the past. The old Italian masters were confined to a limited range of subjects; they restricted themselves to sacred subjects, and, as a consequence of concentrated thought became filled with the spirit and feeling of their work. In conclusion, the chairman referred to the proposed travelling studentship. In visiting Italy and looking at the great masterpieces of the past, the selected student would, he trusted, bear in mind what he had tried to impress on them that evening; the travelling student would not then be ashamed of our own works, and still less would he return to do differently from the past, but would strive to build upon what he had learned and studied.

Mr. J. D. Crace then distributed the prizes, which included a national silver medal awarded to Henry Tidhurst, two large medal awards to Miss Kezia Hytche and Miss Helena Jones, and a national book prize to George E. Tucker. In the third-grade local examinations four Queen's prizes were taken, and 11 "successes" were notified. Besides these there were 16 third-grade prize awards, two free studentships, and 63 second-grade prizes, and several local prizes were also given. Mr. Crace announced that the terms of the proposed travelling studentship had been decided upon that afternoon. A gentleman had placed £120 in the hands of the Painters' Company to be expended for encouraging the art of painted decoration. The Company had intrusted the committee of the West London School of Art with the task of devising a scheme, and they proposed to institute a travelling studentship as an experiment, spreading the money over three years. This would enable the student selected by competition to spend two months on the Continent, and the committee resolved that should the student elect to spend the time in Italy, to add £10 from other sources. To this the Painters' Co. and the original donor had agreed, the latter at once promising to raise the studentship from £40 to £50 should the student decide to visit Italy.

Mr. Rawle, in acknowledging, for Mr. Stewart and himself, a vote of thanks to the past and present masters, expressed his gratification at the generous offer which had been made by Mr. George Mence Smith, and urged the students engaged in decorative art to show their appreciation of this, the only prize of the kind in the kingdom, by earnest work. The winner of the travelling studentship would have exceptional opportunities for improvement and for the refinement of his artistic tastes. If he fairly used his opportunities while in Italy, and kept his eyes and heart open to the glorious influences surrounding him, he would return with a mind refreshed and invigorated, and filled with all-absorbing thoughts regarding the nobility of his art. In this foggy clime they could value but faintly the artistic glories of Italy. That country was a treasure-house of untold wealth to the painter, the sculptor, and the decorative artist. He could testify that it was not till he had been there and had tasted at the fountain-head that he knew that kindling of enthusiasm only to be felt when in the presence of art in all her majesty and glory. Addressing the students, he said all experienced in tuition found students were pretty much alike in character everywhere. By far the great majority were earnest and hard workers; but this subject of congratulation was mingled with regret that as a body students did not think sufficiently. Too much was left to the hand to accomplish, too little directing work was undertaken by the brain. This want of thought was apt to make the student fail in realising the artistic nicety of

his labour. He contemplated it in detail, and the result was a mass of little prettinesses in which the several lights and shades were represented without consideration of the work as a whole, and with an absence of the balance of quantities. The whole heart and mind should be thrown into the restoration of the work set before them as a whole, for all true art work was based upon knowledge, and this could only be acquired by close observation and reasoning upon it.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The third meeting of the session was held last Wednesday, Mr. Thos. Morgan, F.S.A., in the chair. Mr. G. R. Wright, F.S.A., exhibited an early silver denarius, with the name of the 18th Legion, found at Cirencester; and detailed the progress of excavations at the Roman villa at Bromham. Mr. Walford rendered some notes on De Lonne's "Description of London," 1681 and 1690, a scarce book, about to be reprinted. Mr. Lewis produced the fragments of what has been an elegantly-worked coffer of ivory, of 12th or 13th century date, recently found in Telegraph-street. Mr. De Gray Birch, F.R.S.L., described a vase brought from the Egyptian tombs of Gizeh by the Rev. Greville Chester; and also a cast of a copper plate for measuring the tonsure of ecclesiastics of St. Paul's Cathedral. It is hollowed and circular, with the figure of a griffin, and appears to have been reduced in size. Mr. Fryer, F.C.S., reported some discoveries on the site of St. Aidan's Church at Old Melrose. Mr. Loftus Brock, F.S.A., produced a plan, and described the remains now being excavated on the site of old Leadenhall Market. Two long walls, of the 15th century building, are visible, with a series of corbels. A Roman pavement, of ordinary brick tesseræ, has been found over a large part of the surface, and covered with the ashes of some great fire. Above this is concrete of a second floor, while below, the remains of walls, 5ft. thick, have been found, indicating a building of importance. These walls have bands of Roman brick, and one is constructed entirely of that material, pointing to an early period of the Roman occupation. Mr. Grover, F.S.A., referred to the constant finding of traces of a great conflagration in London, which he considered was from the burning of London by Boadicea. The first paper was by Dr. Wake Smart, on "Roman Remains found at Nursling, Hants," which was, in the absence of the author, read from the chair. The remains point to the existence here of an important Roman station, not yet identified, and its position on a line of road from Bitterne was indicated. A large amount of Samian and black ware have been found. The second paper was by Mr. G. R. Wright, on "The Hardship of the present Law of Treasure Trove." After referring to the reason of the law in former days—namely, to help the king and to assist the revenue, with the punishment of death for evasion, the lecturer passed on to these altered times, when its operation caused either the loss of art treasures by their being broken up by the finders for concealment, or the stoppage of works of research. He instanced the case of the Saxon cemetery at Longbridge, which was in course of excavation by the owner, when certain articles of value found were claimed by the Treasury. A discussion ensued, in which Messrs. Compton, Birch, and others took part.

COMPETITIONS.

GLASGOW.—Last week, at the meeting of the Glasgow Town Council, the Committee of the New Municipal Buildings presented the following opinion:—1. That none of the designs which can be executed for £150,000, with 10 per cent. added to cover contingencies, are such as the committee can recommend the Magistrates and Council to accept. 2. That, as the cost of the designs invited under the conditions of competition was limited to £150,000, the committee are of opinion that it would not be expedient to accept any design lodged in that competition, the cost of which would considerably exceed £150,000. 3. That the Magistrates and Council should remit to this committee to prepare new conditions of competition, with a view to the obtaining of new designs. 4. That the plans prepared by Mr. Carrick should be reconsidered by the committee, and as adjusted should be submitted to competitors simply as indicating the accommodation required. 5. That the cost of the building for which the new designs are invited should be increased to about £250,000. It was also thought by them desirable that the new competition should be open. On the conclusion of a protracted discussion, it was agreed, on the motion of Councillor Jackson, to adopt the recommendations, except in so far as they dealt with the cost of the buildings, and the open nature of the competition.

NEWBURY GRAMMAR-SCHOOL COMPETITION.—We are informed that 52 sets of plans and drawings for the New Grammar-School have been sent in, and that the trustees of the municipal charities intend, so soon as Mr. Waterhouse has advised them as to the comparative merits of the plans, to exhibit them in the Town-hall. According to present arrangements, the exhibition may be expected to take place from Monday, the 31st of January, to Wednesday, the 2nd of February.

PONTEFRACT.—Since the determination arrived at by the town council on Thursday night last, to abandon the new Town-hall scheme, about which more will be found in another column, several applications have been sent in from gentlemen asking that their subscriptions should be returned. The town council had nearly £3,000 promised and already subscribed for the new hall, so that if the new building is not ultimately erected, this will be a direct loss to the ratepayers. The latter are generally opposed to the scheme falling through, and a public meeting is contemplated to protest against the action of the town council. The subject, however, is to be again brought forward at a special meeting of the Council.

SCHOOLS OF ART.

TAUNTON.—The annual meeting for distribution of prizes was held on Monday. The financial report showed that the fees had largely fallen off, and also the honorary subscriptions, and that there was now a debt of £60 on the school. The report of Mr. Rowe, head-master, stated that 67 students had attended the school, being a decrease of 24. There had been one Queen's prize, and 3 book-prizes, against nine last year; and 15 second-grade prizes and certificates against 25. Commenting on the fact that many students engaged in mechanical trades openly declared their dislike to the study of practical geometry, Mr. Rowe said nothing but crass ignorance would account for this.

PARLIAMENTARY NOTES.

DUES ON ROUGH TIMBER.—Mr. Broadhurst on Tuesday asked the Chief Secretary to the Lord-Lieutenant of Ireland whether his attention had been directed to the heavy dues imposed on rough timber entering the port of Dublin, and to the hindrances those dues were to the Dublin trades; and, if so, whether the Government were prepared to adopt measures with a view to the abolition of the said dues. Mr. W. E. Forster said that no representation had been made to the Government on the subject, and that there was no power on their part to interfere in the matter.

ACCOUNTS OF SURVEYORS OF HIGHWAYS.—Mr. Stanhope, on Tuesday, asked the President of the Local Government Board whether he intended to take any steps to amend the inconvenient forms of accounts at present required to be filled up by the surveyors of highways in country districts. Mr. Dodson: In framing these accounts the Board endeavoured to do so in as simple a form as possible consistently with the requirements of the Highway Acts, which are very minute, and were previously much disregarded. The forms had to be adapted to large as well as small parishes, and careful provision had to be made for separating the expenditure on main roads from that on ordinary highways for the protection of the county authorities. The auditors have now had nearly a year's experience of the working of the new forms, and the Board are now in communication with some of them in the hope of being able to dispense with some of the forms.

An Improved Dwellings Company has been formed at Stroud, Gloucestershire, under the Limited Liability Act; the capital is £5,000 in £1 shares, and the object is to improve the dwellings of the labouring classes in the borough of Stroud, by purchasing and improving existing cottages and by erecting new ones.

Building Intelligence.

NORTHAMPTON.—The workmen engaged on the extension of the convent of Our Lady, Abington-street, Northampton, were entertained the other day. The architect of the building is Mr. William Hull, of St. Giles's-street, Northampton, and the contractor Mr. Richard Dunkley. The new portion really forms the west wing of a quadrangle, the south side of which has a front elevation towards Abington-street. On the north-east side, with the gabled front towards the quadrangular court, stands the chapel, but in an elevated position. It will be approached by a flight of steps leading up from the court below, the principal entrance being through a narthex in the centre. Within the apse will be placed the high altar, which is to be of sculptured marble, while the floor of the sanctuary will be inlaid with mosaic tiles. On the south-west side will be a small chapel, and on the other side there are convenient sacristies for the officiating priests. The building is nearly ready to receive the roof, which will be an open-timbered one, the wood used being the best pitch-pine. Internally, the walls will be cemented, but the stonework will be shown through. White Mansfield and Bath stone have been used on the exterior, and harmonise well with the white bricks of the Whitwick Colliery Company.

PLYMOUTH.—The first stone of a block of artisans' dwellings was laid on Tuesday week by the Vicar of St. Andrew's Church in this town. The site in St. Andrew's street has been cleared by the corporation, and was sold by them on the condition that only labourers' dwellings, in accordance with stringent conditions, should be built. Mr. John Pethick is the builder, and the property now belongs to Sir E. Bates, ex-member for the borough. Red brick is to be used for the walls and grey bricks for dressings, and the plinth will be of limestone masonry; the roofing is to be of purple slates. There will be two blocks, each containing twelve distinct and self-contained lettings of a living room 12ft. square, bedrooms 11ft. by 9ft., a pantry, and coal-bunk. The height of rooms will be 10ft. clear on ground-floor, and 9ft. 6in. above. On each floor will be a wash-house and separate closets for each sex. American cooking-ranges will be provided in the living-rooms, and the ventilation is by one of Jennings' contrivances. The rents are to be from 1s. to 1s. 2d., and it is said will return 5 per cent. on the outlay. Messrs. Hine and Odgers are the architects. Two other blocks of artisans' dwellings will be erected by the same architects and builder in Haliwell-street, Plymouth, and will be four stories high, built in red brick with grey courses and dressings, and will be let at 15d. per week.

RICHMOND.—The committee of the new club at Richmond, the Wilderness, entertained a number of gentlemen connected with the Press at luncheon, on the 29th ult., preparatory to the opening of the club. The name "Wilderness" is that by which the property has long been historically known. It belonged for years to the Devonshire family, and it was here that the beautiful Duchess, the subject of Gainsborough's celebrated portrait, passed several years of her life. More recently the house was given to the Hon. Mrs. Lamb, and in the alterations made for the club accommodation, the foundation-stone, laid by her in 1833, was unearthed, and will form the corner-stone for the proposed new ladies' entrance to the club. The lawn tennis and pleasure grounds, which will not be complete until next spring, have been tastefully laid out under the superintendence of Mr. J. F. Johnson, the eminent landscape gardener, known in connection with the Crystal and Alexandra Palaces flower-shows. The Wilderness has been most handsomely furnished throughout by Messrs. W. Walker and Sons, of Bunhill-row.

SALTAIRE.—New Wesleyan Sunday-schools at Saltaire were opened on the 1st inst. The building, which is erected on a piece of ground in the rear of the chapel, is in the Italian style, and was designed by Mr. H. Isitt, of Bradford, upon the American plan, similar to the Sunday-schools of the Congregationalists at Saltaire. The schools consist of a large central hall, with galleries on three sides. Leading from these and from the hall below are 20 class-rooms, capable of accom-

modating 650 scholars, and the central hall will also hold a large number. The size of the hall is 48ft. by 37ft. 6in. Near the entrance is the library, and on the same side are lavatories and other conveniences. The cost of the building and furniture has been £2,200.

More than Fifty Thousand Replies and Letters on subjects of Universal Interest have appeared during the last ten years in the ENGLISH MECHANIC AND WORLD OF SCIENCE, most of them from the pens of the leading Scientific and Technical Authorities of the day. Thousands of original articles and scientific papers, and countless receipts and wrinkles embracing almost every subject on which it is possible to desire information have also appeared during the same period. The earliest and most accurate information respecting all new scientific discoveries and mechanical inventions is to be found in its pages, and its large circulation render its the best medium for all advertisers who wish their announcements to be brought under the notice of manufacturers, mechanics, scientific workers, and amateurs. Price Twopence, of all booksellers and newsvendors. Post free 2½d. Office: 31, Tavistock street, Covent-garden W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. R. M. TUTTLE, of 13 and 15, Laight-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Cases for binding the half-yearly volumes, 2s. each.

"BUILDING NEWS" DESIGNING CLUB.

LIST OF SUBJECTS.

A. A row of three shops for a village, on a corner site, the angle house to be arranged as a small inn. Height of ground floor, 12ft., and two floors above, one of which may be obtained partly in roof. Plans, elevations, sections to be one-eighth of an inch to the foot. Sketch perspective.

B. A sedilia with three seats, and canopy over, in oak. Plan, elevation, and sketch. Scale, 1½in. to the foot.

DRAWINGS RECEIVED.—En Avant, Clarior e Tenebris, Frank Weaver, Sub Judice, Juvenis, Ambition, Ralph, B. J., Nil Desperandum No. 2, Nemo in Shield, Snowflake, Curion, Beta, Arnold, Motto A.

A. L. HUSBAND. (We have noted address.)—BETA AND OTHERS. (If the name and address had been written on the back of drawing it would not have miscarried, and we must again repeat our request that this will be attended to. Non-compliance with it occasions us a deal of trouble.)—NIL DESPERANDUM.

SEWERS AND MANHOLES. (In reply to several correspondents, the sheets of detail drawings of pipe sewers and manholes on steep gradients referred to by us last week, issued by Mr. Rawlinson, C.B., may be obtained of any of the following:—Knight and Co., 90, Fleet-street; Harrison and Sons, 59, Pall-mall; Edward Stanford, 55, Charing-cross; W. H. Allen and Co., 13, Waterloo-place; Shaw and Son, Fetter-lane; Waterlow and Sons, Great Winchester-street. The price of the sheet is 2s.)

Correspondence.

GLASGOW MUNICIPAL BUILDINGS COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—"T. L. W." may rest assured that I do not covet the twelfth juryman's place, and if he will consider that the most of the 90 are disqualified on indisputable grounds, apart from the one now under notice, he will see that I do not take it in fact.

As to blackening windows, he must bear with me when I remind him that his assertion, though repeated very earnestly, cannot, upon such a question, be regarded as a proof. I have no doubt he means to be correct; but, on the other hand, I am quite satisfied that an elevation having its windows blacked in, is, to that extent, not "in line," though all the rest may be. If one wash with the brush is "in line," so is another; and those who put only a *dark* Indian ink tint on their windows are also right, and a flat Indian ink tint (no colour) on the wall may be used, and then a darker one on nearer parts, and so on. I read the words, "in geometrical form only, in line," and understand that any kind of wash with a brush is inadmissible, for the two things are a contradiction in terms. Therefore, I wrote no inquiry about the "intention," because I found "no room for doubt as to the meaning of the expression," and the intention was equally clear. It is true the words "in line *only*" are not used, but "form only, in line" are, and anything not "in line" is excluded because it is not "in line," which the instruction demands it should be.

If, however, "T. L. W." should contend that work done with a brush is "in line," I think you, Mr. Editor, will be quite justified in intimating that this correspondence may now cease, without reply from me.—I am, &c.,

ANOTHER COMPETITOR.

LIVERPOOL CONSERVATIVE CLUB COMPETITION.

SIR,—Learning that the plans for which the 2nd and 3rd premiums had been paid, had been sent to, and retained, at the offices of the architects to whom the first place had been awarded, I felt it my duty to protest against such an unusual course, and now inclose copy for publication with this, leaving comment to others, and merely saying that although I have waited since the date therein, no reply or even acknowledgment of receipt is to hand, notwithstanding my membership of the club, and position as a competitor.—I am, &c., C. O. ELLISON.

TO THE COMMITTEE OF THE CONSERVATIVE CLUB.

GENTLEMEN,—In June last your building committee wrote me as to sending in plans for our new premises, and I agreed to do so upon the conditions issued, which provided for *award* of premiums *only* by a referee, the "committee of the club reserving specially to themselves the right to make their own selection of the design to be carried out."

At considerable outlay of time and money I visited 18 to 20 of the principal clubs in the kingdom, going with their experienced managers into all the important details of their arrangements, especially having proved defects pointed out, so as to avoid them in our new club. I then prepared plans, submitting them to four of the most practical of the Metropolitan club managers, who pronounced them more complete than any existing club, alike for comfort of members and economy of working, whilst the great economy in first-cost is seen from the fact that my said plans gave all your requirements with no less than 65,000 cubic feet less building than the plans which have been accepted—the heights of the principal rooms being the same.

The referee having done his part, awarded the premiums, and admitted that the unusual merit of the drawings made the "task a peculiarly difficult and onerous one," I wrote you (prior to your making the selection of the designs to be carried out, as per terms of competition) most respectfully asking that, in face of the above difficulty, the authors of three premiated designs be "each permitted to point out the specialities of his own plan, and further compare same with others, leaving the committee sole judge as to the points so brought out, by which means each competitor would be placed on the same level of advantage; all the special features of each plan would be pointed out by those who had spent many weeks in special study of club arrangements, information which must be of the utmost importance or value to gentlemen having the final selection of plans to make," a request which, with all its manifest fairness to the competitors and advantages to our club, was, I regret to say, refused.

According to the terms of competition, the sum of £125 was paid by way of premium *only* to the authors of the plans placed respectively 2nd and 3rd in the order of merit, the said plans being "considered the property of the committee"; but that this could only mean for custody or reference, and without any right whatever of use or execution, must be plain from the fact that the conditions being drawn up by so eminent an architect as the referee (Mr. Waterhouse), he would not be likely to give to any committee two full sets of drawings with right to use and execute them for a mere premium, the amount of which would not even cover the actual money cost of their production.

Further, if the right of your committee in this matter is to be taken as absolute, then it would empower you, by the mere payment of three premiums, together amounting to £225, to take the three best sets of drawings sent in (worth several times this amount on the ordinary terms of my profession), set aside their authors, and employ anyone else who liked to carry out their plans without any further compensation, an injustice so glaring as at once to show that this could never have been the intention either of those who made or those who worked to the conditions.

As to the selection made, I offer no opinion whatever; but it having come to my knowledge that, notwithstanding the fact of no meeting of the executive committee of the club having yet had the plans under consideration, for making the selection specially reserved thereto, the 2nd and 3rd prize drawings have been sent to and retained at the offices of the architects selected by the building committee, presumably for them or those about them to make such use of as they may think fit. I, as the author of the second prize plans, enter a most emphatic but respectful protest lest such an unusual treatment of competitive drawings should become a precedent by its adoption in so important a competition as the Liverpool Conservative Club. By all means let the chosen plans be carried out and their authors have the credit and profit which is their due; but I put it to you as business men, Is it right, or in any sense reasonable, because you have paid mere premium in acknowledgement of the skill displayed in the drawings placed second and third in point of merit, that you should make use thereof to the advantage of our club, and that at a price which does not cover cash out of pocket by their authors, and cause even the credit thereof to be given to others?

In sending this protest, I wish to be understood as animated by no want of respect to any member or members of the committee, or desirous of interfering in any way with the execution of the plans as sent in competition by Messrs. Holmes, but solely with a view of preventing a precedent being formed such as could but prove eminently detrimental to the best interests of the profession to which I have the honour to belong.

Your obedient servant,
C. O. ELLISON.

SHEFFIELD FONT COMPETITION.

SIR,—As you are aware, designs were invited for a new font which was to be erected in Sheffield Parish Church, these designs were to be lodged with the Secretary by 1st September last. In response to that invitation I sent in design which was duly returned, carriage paid, about two months afterwards, without so much as a note to indicate the names of the successful competitors. Have all the competitors been treated thus? I have waited patiently to see if your columns would make the matter clearer, but I have waited in vain.

Is there no information forthcoming on the subject?—I am, &c., A LAST RESOURCE.

"A WONDERFUL STOVE."

SIR,—I have only just seen Mr. Burges' letter in your issue of 31 Dec. last, asking where I saw the Phœnix above alluded to.

It was in a house at Shepherd's-bush, whither I was taken by my friend, the inventor, Mr. Samuel Russell.

Since my letter of Nov. last, I have had many communications from manufacturers, asking for Mr. Russell's address, and I have forwarded to them the last given me by that gentleman, viz., Mr. Samuel Russell, 83, Macfarlane-road, Shepherd's-bush.—I am, &c.,

JOHN P. SEDDON.

1, Queen Anne's Gate, Westminster, Jan. 10.

FUTURE OF CEMENT.

SIR,—We have read with great interest the letters which have of late appeared in your publication regarding concrete. And as we have had some little experience in this class of work during the last fifteen years, and having within the last two done some 10,000 cubic yards, we thought we would give our quota for the benefit of those who care to take it.

We have always found that aggregates of the hardest, roughest, and cleanest description, along with a slow-setting cement of the highest quality, are necessary to make a concrete that will be durable and effective. In this matter we entirely agree with Mr. H. Reid.

We have also found that the least admixture of loam or other matter of a dirty or clayey nature tends to "kill" the concrete, and failure is the result. It is impossible to make good concrete, unless you have perfectly clean and hard materials. Our concrete works consist of laying down pavements, railway-platforms, warehouse, stable, basement, dairy, fireproof, and every other description of floors. As regards the manufacture of concrete work for heads, sills, cornices, &c., we have not made a

spécialité of it, but we have made work to many architectural designs, and can show in our office, if any one cares to call and see, concrete as hard as Spinkwell stone, and of a beautiful colour. This could not be obtained, except under the conditions above stated. Owing to the thinness of the work, of which we *do* make a spécialité, averaging from 3in. to 4in. thick, we are obliged to use the very best materials, and we have never had a single failure in the work we have done.

Some of our clients inform us that pavements laid by us several years ago, have as yet shown no perceptible signs of wearing.

By our system we can make a concrete as hard as granite, quite as durable, and far more pleasing in appearance.

We laid in Oxford-street and Cavendish-street, nearly six months ago, for the Marylebone Vestry Board, a pavement, which has not yet worn in the least, although the daily traffic to which it is subjected is enormous. It is every day increasing in strength.

And now, Sir, there is one point on which none of your correspondents on concrete have ever touched—*i.e.*, the advantages of concrete for street pavements in London and district.

Many thousands of yards of York flags and asphalte are laid yearly in the Metropolitan district, the cost of which must amount to a very large sum of money. Now by laying concrete instead, the district boards would make an enormous saving; the cost of concrete being much less per yard.

Again, in a sanitary point of view, it has its advantages. It is impervious to damp, and having no joints, moisture cannot percolate through it to the cellaring beneath. The gentleman in front of whose premises we laid the pavement in Oxford-street informs us, he has now, for the first time in twenty years, dry cellars.

We think, Sir, concrete for street pavements is one phase in the "future of cement" which ought to receive due consideration. By its use much money might be saved, and the pockets of the ratepayers and the community at large will be benefited.

Surely if the people in the northern counties of England, the places from whence the stone for paving is obtained, find it more advantageous to use concrete in preference to stone or asphalte, it must be more to the advantage to those in the south to use concrete.

We can say without fear of contradiction that those who once use concrete, and who have the work properly done, will never use anything else. For wherever stone, clinker, or asphalte is used for pavements of any description, there concrete can be substituted very much to the benefit of those who use it.—We are, Sir,

"EUREKA" CONCRETE COMPANY.

Queen's-buildings, 52, Queen Victoria-street.

Intercommunication.

QUESTIONS.

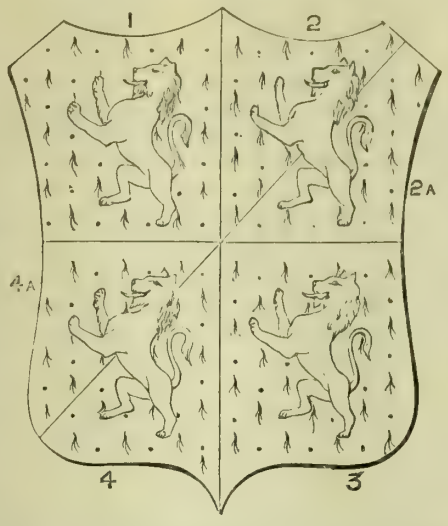
[6354.]—**Measuring Zincwork.**—If I order a 6ft. zinc elbow chimneypot, and it is charged at 1s. 4d. per foot, how many feet ought I to pay for? This is an ordinary pot, stock size, and used daily.—ZINC.

[6355.]—**Harmonic Proportions**—I am informed by a friend that several of the leading architects work or design to a rule of harmonic angles or proportions. From what I have read and seen in my time I presume this is not so. Perhaps some kind reader will enlighten me.—SAGAR.

[6356.]—**Cubing Workhouse.**—Will any of your numerous readers kindly tell me what would be a fair price to cube a new workhouse at to accommodate, say, from 300 to 400 persons, the building intended to be very plain, built of stone, the quarry being within three miles of the site? Should the master's house, hospital, &c., be cubed at a different price?—J. C. W.

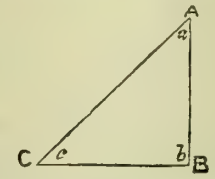
[6357.]—**Lining for Turkish Bath.**—Will some reader kindly tell me of the best lining for the walls and ceilings of the hot-room of a Turkish bath? The walls are old and well built, the surface next the rooms to be lined with white tiles to a height of 5ft. It is of great importance that the heat should not penetrate to the adjoining rooms.—SUBSCRIBER.

[6358.]—**Stone Shield—Cellar.**—I am about directing a carver to prepare a shield in stone, after the form of the pen and ink sketch herein, the original of which is painted in colours as described on the said sketch. Please say how the panels No 2, 2A, 4, 4A (I mean their grounds), should be prepared to show distinctly the quartering. Should they differ from No. 1 and No. 3? Kindly say how the ground in each panel should be prepared in stone, whether they should be tooled, or bolstered, or otherwise. The shield is panelled in the following colours:—Divisions 1, 2, 3, and 4A, black ermine on white ground: 2A, and 4, white ermine on black ground. I have also built a good house with excellent cellars, running north and south, and in forming these had to excavate into a rock some 2ft. 6in. or 3ft., which rock dips westward. The consequence is that after heavy rains the water floods the



cellar by running with formation of the rock, which dips from east to west. What would you recommend to prevent this flooding of water?—CONSTANT READER.

[6359.]—**Mathematical.**—Will some mathematician please give the produt of the following (taken from



Spon's tables), by giving value to the letters, say, AB = 15, BC = 9, CA = 12, and oblige. When three sides are given, to find the angles Cos. $a = \frac{AC^2 + AB^2 - BC^2}{2AC \times AB}$.—W. K.

[6360.]—**Brighton Clock-Tower Competition.**—In the BUILDING NEWS of January 7th I find that the Brighton Town Council have decided to have a competition for clock-tower, &c., but no size in any shape or form is given, only the amount it must cost. Can anyone give further information?—A SUPPORTER OF YOUR VALUABLE PAPER.

REPLIES.

[6345.]—**Surveyor's Charges.**—A customary charge is 2 to 2½ per cent. for quantities when tender is accepted, but the charge is sometimes as low as 1½ per cent. For simply making an estimate from quantities supplied, a fair charge would be be 1½ per cent., but it is usual to make an arrangement. "Quantity Surveyor" says he is often called on to take out quantities and make estimates for builders, taking no risk nor responsibility for accuracy. All that need be said is that if builders contract upon such conditions, they cannot fairly look to architects in case of loss. The system, on the face of it, is objectionable, for it stands to reason that if the surveyor is really the estimator for a building and is not responsible for accuracy, he would be inclined to underprice for the sake of winning the contract.—G. H. G.

[6346.]—**Landscape Gardening.**—A small work on the subject is published by Mr. Kemp, entitled, "How to Lay Out a Garden" (Longman and Co.), but Repton's work on Landscape Gardening is still the authority. The subject has been frequently attended to in the BUILDING NEWS.—G. H. G.

[6347.]—**Perspective Drawing.**—"H. K. A." had better get Nicholson's "Principles of Perspective." Burchett's Perspective is a modern and very good treatise for ordinary use.—G. H. G.

[6350.]—**Surveying.**—In our neighbourhood the outside of ditch (say, 3ft to 5ft. from quickset plant according to custom) would be the boundary line, but it does not necessarily follow that you can build out of that line.—DORSETSHIRE SURVEYOR.

The town council of Wolverhampton had before them on Monday the various accounts recommended for payment in connection with the streets' improvement scheme, including an item of £840, fees claimed by Sir H. A. Hunt, the official arbitrator. Great astonishment was expressed at the largeness of the charge, which was denounced as exorbitant; but several members discouraged the proposal to appeal to the Local Government Board as a useless addition to the expense, it being stated that though other towns had protested against the charges made by Sir H. Hunt, they had been compelled to pay in full. It was resolved to pay the account less the amount charged for arbitrator's fees, it being stated that Alderman Fowler, the member for the borough, would bring the claim before Parliament.

Our Office Table.

WE shall watch with some interest the progress of the Sanitary Protection Association, described elsewhere in a paper read by Prof. Fleeming Jenkin, F.R.S., before the Society of Arts on Wednesday. One great merit of Prof. Jenkin's programme is its simplicity and its freedom from fads. If the association is to have a permanent and useful existence, its officers must carefully avoid any partiality for sanitary patents, or the public will soon think them interested, and must in every case be thorough in the inspections they make, or their customers will soon come to regard their examinations with indifference. If these two points are kept steadily in view, the association may do much good. We are glad to see Mr. Cresswell's idea of granting a certificate to the house of its sanitary condition is to be embodied in the scheme.

THE Melbourne correspondent of the *British Mercantile Gazette*, noticing Messrs. Clark, Bunnett, and Co.'s exhibits at the Melbourne Exhibition, says their pavilion in the British Court covers an area of 2,250 superficial feet, and is about 16ft. high, the whole of which, except the carpeting and upholstery, is constructed of various patterns of shop-fronts, new designs of pilasters, columns, spandrels, and ornamented brass and ironwork generally; all of a most substantial and elegant workmanship. The pavilion is inclosed with the noiseless, self-coiling, revolving steel shutters of which the exhibitors are the sole patentees, manufacturers, and exhibitors. Some are of very delicate construction, and may be handled by a child of tender years, though they are effective against the ordinary operations of thieves; others are massive, and intended for banking-houses and buildings of a similar description, which require to be well protected from the assaults of the skilful burglar. The interior of the pavilion is also utilised to the best advantage. Samples of the various kinds of the manufactures of the company are displayed in profusion. These include many designs of shutters suited for shop-fronts, doorways, cupboards, hatchways of ships, and for a variety of other purposes. Also their new metallic Venetian blinds, which when folded occupy but very little space when compared with the old-fashioned window-blinds. The pavilion is utilised as an office by the representatives of the firm, and is regarded by all visitors as one of the most ornate within the building. Colonel Sir Herbert Sandford, Special Executive Commissioner for Her Majesty's Imperial Government, was delighted with its appearance.

AT a special meeting of the Birmingham town council, held on Tuesday, a report was presented by the General Purposes Committee upon the appointment of architects for corporation work, which recommended that the various committees should exercise their discretion in the matter in reference to buildings and alterations involving a cost of less than £10,000; but that in cases above that amount competitive designs should be invited. An amendment to substitute a limit of £5,000 was proposed by Mr. Brinsley and seconded by Alderman Heaton, but it only received the support of 9 members against 46.

At a meeting of the Lower Thames Valley Sewerage Board, held at Kingston on Wednesday week, Mr. Thomas Hawkesley was engaged as engineer to advise the board on the best way of dealing with the sewage of the joint district, with the proviso that he will have no claim to carry out any recommendation he may make.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill. *Use no substitute* —[ADVT.]

Holloway's Ointment should be well rubbed upon the pit of the stomach and region of the heart in that particular form of indigestion which gives rise to palpitation, shortness of breath, and a suffocating sensation. Every distressing symptom soon yields, digestion becomes easy, the spirits light, and good health returns.

Epps's Cocoa.—Grateful and Comforting.—"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*—Sold only in Packets labelled—"JAMES EPPS and Co., Homœopathic Chemists, London."—Also makers of Epps's Chocolate Essence for afternoons.

CHIPS.

The port commissioners of Yarmouth appointed, on Tuesday week, on the recommendation of Sir John Coode, consulting engineer, Mr. Richard Seldon, of South Tawton, as superintendent of the extensive concreting operations about to be carried out at the Spur-breakwater and south pier, at a salary of £3 10s. per week.

New schools, in connection with St. Mary's Church, Hollingsworth, erected at a cost of £3,000, and accommodating 800 scholars, were opened on Saturday. They have been erected from the plans of Mr. James Sidebottom, the present mayor of Glossop, at the sole cost of his sister, Mr. A. Houghton being the contractor for the joinery work, and Williams and Hope, Dinting, Glossop, contractors for the masonry.

Doulting Freestone and Ham Hill Stone of best quality. Prices, delivered at any part of the United Kingdom, given on application to
CHARLES TRASK,
Norton-sub-Hamdon, Ilminster, Somerset.
—[ADVT.]

McLACHLAN & SONS, 35, St. James's-street, S.W. Builders, Decorators, and House Painters.
Designs and Estimates.
General Repairs and Alterations Executed.
Experienced Workmen always in readiness, and sent to any part of the country.—[ADVT.]

BATH STONE.
SUMMER DRIED,
CORSHAM DOWN,
100,000 Feet Cube.
PICTOR & SONS, BOX, WILTS.
[ADVT.]

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—London Institution. Dr. Huggins, F.R.S., on "The Photographic Spectra of Stars." 5 p.m.
Royal Institute of British Architects. Adjourned discussion on paper by E. C. Robins, F.S.A., on "Sanitary Science in its Relation to Civil Architecture." 8.10 p.m.

WEDNESDAY.—Royal Architectural Museum. Distribution of Prizes by Right Hon A. J. B. Beresford-Hope, M.P. 8 p.m.
British Archæological Association. "Notes on some Prehistoric Remains near Feating, Forfarshire." By J. Romilly Allen, A.M.I.C.E. 8 p.m.
Society of Arts. "The Causes of Success and Failure in Modern Gold Mining." By A. G. Lock, F.R.G.S. 8 p.m.

THURSDAY.—London Institution. "The Production of Electricity." By Prof. W. E. Ayrton. 7 p.m.
Civil and Mechanical Engineers' Society. "The Application of Hydraulic Machinery to Mines, Gas Works, Grain Warehouses." By J. Coates, F.G.S., A.M.I.C.E. 7 p.m.
Fine Arts Society. Conversazione at the Suffolk-street Galleries. 8 p.m.
Royal Institution. "The Troubadours." By F. Hueffer. 3 p.m.

FRIDAY.—Architectural Association. "Parsonages." By Lacy W. Ridge. 7.30 p.m.
Society of Arts. "Forest Conservancy in India." By Sir R. Temple, Bt., G.C.S.I. 8 p.m
Royal Institution. "The Electric Discharge." By Warren De la Rue. 9 p.m.

SATURDAY.—Parkes Museum of Hygiene. "Water Supply and Filtration." By Prof. Corfield, M.A., M.D. 3.30 p.m.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender—it adds to the value of the information.

ALDERSHOT.—For the drainage of Church-lane, for the local board:—
Cranstone (accepted) £325 0 0
[Seven tenders received.]

ASCOT.—For additions to "Beech Grove," for J. Hickens, Esq. Mr. P. J. Byrne, architect:—
Exclusive of painting and papering:—
Abbott and Charman (accepted) ... £375 0 0

BANSTEAD, SURREY.—For supplying and fixing drying-horses and disinfector at the school, Banstead, for the managers of the Kensington and Chelsea school district. Messrs. A. and C. Harston, architects, 15, Leadenhall-street, E.C.:—
Clements and Co. (accepted)... ... £150 0 0
For planting trees and shrubs at the above school:—
Burley (accepted) £264 0 0

BETHNAL-GREEN.—For new sashes to the dining-room windows at the workhouse, for the guardians of St. Matthew, Bethnal-green. Messrs. A. and C. Harston, architects:—

Harradine	£147 0 0
Johnson, J. H....	140 0 0
Heiser	139 0 0
Harris and Wardrop	123 0 0
Lascelles...	115 0 0
Dodds and Robb (accepted)... ...	97 10 0

BEXHILL-ON-SEA, SUSSEX.—For the making of roads and drains at Bexhill:—

Kinnett, G., Hastings	£2,281 0 0
Jenkins, P., St. Leonard's ...	2,000 0 0
Challoner, E., Eastbourne ...	1,958 18 0
Oliver, A., Brighton	1,790 0 0
Bull, E., Hastings	1,744 10 0
Skinner, T., Horsham	1,495 0 0
Cruttenden, F., St. Leonard's ...	1,428 0 0
Dibley, J., Hastings	1,389 0 0
King, A., Hollington (accepted)...	850 0 0

DARENTH, KENT.—For supplying and fixing electric bells at the Asylum for Imbeciles, Darenth, for the managers of the metropolitan asylum district. Messrs. A. and C. Harston, architects, 15, Leadenhall-street, E.C.:—
Sax (accepted) £240 0 0

DATCHET.—For additions and painting at Datchet Lodge. Mr. P. J. Byrne, architect:—
Simpson, A., Egham (accepted) ... £250 0 0

EGHAM.—For villa, for Robert Oades, Esq. Mr. P. J. Byrne, architect:—
Head, W., Egham (accepted) ... £450 0 0

EGHAM.—For pair of cottages, for J. Walker, Esq. Mr. P. J. Byrne, architect:—
Head, W. (accepted) £350 0 0

GREETLAND.—For the construction of drainage works, for the local board of Greetland, near Halifax:—
Jowett, J., Brighouse (accepted) ... £692 0 0

HALIFAX.—For the construction of sewerage works at Hove Edge, for the Halifax rural sanitary authority:—
Roberts, B., Low Moor (accepted)... £192 8 9

HORNSEY.—For alterations at "Howard Arms," South Hornsey, for Mr. Bennett. Mr. H. I. Newton, architect, 27, Gt. George-street, Westminster:—

Smith	£544 0 6
Wood	494 0 0
Lamble	412 0 0
Godden	397 0 0
Coles	360 0 0
Walker (accepted)	328 0 0
For new counter at above:—	
Warne	109 0 0
Heath	99 0 0
Hellings (accepted)	86 17 6
For gasfitting at above:—	
Winn (accepted).	

HORSHAM.—For iron pipes for the siphon at the sewage farm, for the Horsham local board:—
Moon, J., Horsham (accepted) ... £158 0 0

KENSINGTON.—For the following works at the infirmary, for the guardians of St. Mary Abbott's, Kensington. Messrs. A. and C. Harston, architects, 15, Leadenhall-street, E.C.:—
New oakum-room:—
Mills (accepted)... ... ... £105 0 0
Saw-bench, &c.:—
Busby (accepted) £135 0 0
Cleansing and keeping in order the lifts, £15 15s.

LIMEHOUSE.—For new dead-house, for the churchwardens of St. Anne, Limehouse. Messrs. A. and C. Harston, architects, 15, Leadenhall-street, E.C.:—
Walker (accepted) £366 14 0
For new railing, &c., to part of churchyard:—
Walker (accepted) £165 0 0

LONDON.—For pulling down and rebuilding the house, No. 97, Leman-street, E. Mr. W. A. Longmore, architect:—

Read	£989 0 0
Hunt	954 0 0
Lusk (accepted)	780 0 0

NORTHAMPTON.—For the church of St. Michael and All Angels. Mr. G. Vialls, architect, London. Quantities by Mr. L. C. Riddett:—

Roberts, Weedon	£5,500 0 0
Gee, Daventry	5,322 0 0
Cosford, Northampton	5,300 0 0
Watkin, Northampton	5,225 0 0
Martin, Northampton	4,974 0 0
Dunkley, Blisworth (accepted) ...	4,594 0 0
(Architect's estimate, £4,950.)	

NOTTINGHAM.—For making, metalling, kerbing, channelling, and sewering private road in the borough of Nottingham. Mr. Frederick Jackson, C.E., engineer:—

Russell, J. and W.	£267 10 0
Cordon, W.	218 11 0
Smart, T. (accepted)	205 0 0

SOUTH STONEHAM.—For the building of an additional room for the use of the assistant matron, and for other alterations at the workhouse, Southampton:—

Rowland, J. W., Southampton ...	£76 0 0
Witt, Bitterne	69 16 0
Bennett, Woolston	65 11 0
Comport, Bevois Valley	59 10 0
Haynes, Westend (accepted)... ...	47 0 0

STRATFORD.—For painting and decorating at "Carpenter's Arms," Stratford, for Mr. Symes. Mr. H. I. Newton, architect, 27, Gt. George-street, Westminster:—
Walker (accepted) £108 0 0

WALTHAMSTOW.—For two houses and shops at Walthamstow, Essex, for Messrs. Mann, Crossman, and Paulin. Mr. Ernest Shum, architect, 14, Great James-street, W.C. Quantities by Mr. J. G. Raynes:—

Cole	£1,330 0 0
Good, Bros.	1,210 0 0
Fuller	1,090 10 0
Langmead and Way (accepted) ...	1,077 0 0

WESTMINSTER.—For stable-building at Westminster, for the Right Hon. Lord Brabourne. Mr. Henry S. Legg, Christ's Hospital, architect:—

Hatfield	£1,750 0 0
Macey and Son	1,550 0 0

WESTMINSTER.—For new building in Carteret-street, Westminster. Mr. Henry S. Legg, Christ's Hospital, architect:—
Hatfield £5,950 0 0

WOLVERHAMPTON.—For two shelters in the public park Wolverhampton, for the town council:—
Bradney and Co. (accepted) £136 0 0

WINDSOR.—For villa, for R. Ford, Esq., solicitor. Mr. P. J. Byrne, Windsor, architect:—
Dakin, J., Clewer (accepted) ... £1,400 0 0

BEST BATH STONE.
Westwood Ground, Box Ground Combe Down, Corsham Down, and Farleigh Down.
RANDELL, SAUNDERS, & CO., LIMITED,
CORSHAM, WILTS.

Bath Stone.—Every description and the best quality supplied direct from his own Quarries by
ISAAC SUMSION, NEWARK STREET, **BATH.**
Quarryman and Stone Merchant. Established 1791.
Prices, delivered to any part, furnished on application.
—[ADVT.]

PERSPECTIVES in Pen and Ink, and other Drawings made at moderate charges.—J. G BUCKLE, architect, 10, Adam street, Adelphi, W.C.

PERSPECTIVES and other DRAWINGS made coloured, etched, or finished in any style on reasonable terms. — Address, W. PRINCE, Chapel-road Sale, Manchester.

PERSPECTIVE VIEWS and other DRAWINGS effectively rendered in colour or pen and ink. Reference to works published and exhibited by J. DONKIN, Architectural Artist, 17, Argyll-road, Kensington, W.

QUANTITIES.—Quantities taken out and guaranteed by a Surveyor of twenty years' experience upon most reasonable terms.—Mr. CHUTCHLOE, 3A, Poets-corner, Westminster Abbey.

STOCKS.—Good STOCK BRICKS for SALE, at Tanners' Hall Brickfield, Silver-st., Edmonton. Apply for prices to
PHŒNIX WORKS, Kingsland Green, E.,
Or to the Manager on the Field.

FOR SALE.—A 6-horse power second-hand Portable Steam Engine, in good condition, and a new 6ft. pan Mortar Mill; price, One Hundred and Twenty Pounds. Can be seen at BARROWS and STEWART'S WORKS, Banbury, Oxon.

DRY WAINSCOT in every thickness at 6½d. per foot in the inch. Dry Mahogany from 6d.
Dry Yellow Deals, £16 10s. per 120.
Spruce Deals, £15 per 120, 12ft. 3in. by 9.
Dry Floor Boards, from 10s. 6d. per square,
T. FORMAN, Walnut Tree-walk, Lambeth, S.E.

THE AYLESFORD POTTERY COMPANY are prepared to supply GAULT BRICKS, ROOFING, and RIDGE TILES (plain and ornamental, red and dark), SALT GLAZED STONEWARE DRAIN PIPES, CHIMNEY POTS, AGRICULTURAL PIPES, &c. in Trucks at Aylesford Station (S.E.R.), or in Barges at the Works.
For Prices, &c., apply to THOMAS STANFIELD, Aylesford Pottery Company, 158, York-road, Lambeth; or to JOSEPH HAMBLET, at the Works, Aylesford, near Maidstone, Kent.

BRICK MACHINERY for SALE, owing to completion of Sewerage Works Contract.—Two MACHINES, with clay crushing roller mills and hoists complete, in good working order, by Clayton, London. Each will make 14,000 bricks per day to required size, from all kinds of clay and marl. Also Four Tons of new BARROW PLATES, and 500 yards of PORTABLE TRAMWAY, which can be laid down, picked up, and removed instantly; gauge, 2ft. 6in. Waggons and Turntables for same.—S. PEARSON and SON, Ipswich.

PORTABLE ENGINES for SALE.—Two 14 H.-P., and one 8 H.-P., by Ruston and Proctor, one 8 H.-P. by Turner, and one 6 H.-P., by Beverley Iron Company, all in splendid order, and equal to new.—S. PEARSON and SON, Contractor's Office, Ipswich.

HENRY KING (Late Green & King), House Painter, Upholsterer, and General Contractor, 29½, Shouldham-street, Bryanston-square, W. (Late 100, New Bond-street.) Designs prepared, and Estimates given.

ESTABLISHED 1851.

BIRKBECK BANK.—Southampton-buildings, Chancery-lane.
Current Accounts opened according to the usual practice of other Bankers, and Interest allowed on the minimum monthly balances, when not drawn below £25. No commission charged for keeping Accounts.
The Bank also receives money on Deposit at Three per cent. Interest, repayable on demand.
The Bank undertakes for its Customers, free of charge, the custody of Deeds, Writings, and other Securities and Valuables; the collection of Bills of Exchange, Dividends, and Coupons; and the purchase and sale of Stocks and Shares.
Letters of Credit and Circular Notes issued.
A Pamphlet, with full particulars, on application.
FRANCIS RAVENSCROFT, Manager.
31st March, 1880.

The Birkbeck Building Society's Annual Receipts exceed Four Millions.

HOW TO PURCHASE A HOUSE FOR TWO GUINEAS PER MONTH, with immediate Possession and no Rent to pay. Apply at the Office of the BIRKBECK BUILDING SOCIETY.

HOW TO PURCHASE A PLOT OF LAND FOR FIVE SHILLINGS PER MONTH with immediate Possession, either for Building or Gardening purposes. Apply at the Office of the BIRKBECK FREEHOLD LAND SOCIETY.
A Pamphlet, with full particulars, on application.
FRANCIS RAVENSCROFT, Manager.
Southampton-buildings, Chancery Lane.

THE BUILDING NEWS.

LONDON, FRIDAY, JANUARY 21, 1881.

COMMISSION ON PLANS.

CASES recently decided and reported in our columns have made it appear that the remuneration an architect usually receives for works that have not been executed he is not entitled to legally. Lord Coleridge's ruling, in the recent case mentioned in this journal of the 31st ult., cannot have failed to show the uncertainty of the right of architects to charge a commission on work not executed. But long before this instance, other decisions have been made in the teeth of the usage accepted by the profession, and upon which architects plead in justification of their claims. We have only lately pointed out the unsatisfactory system of payment by percentage, that it is neither fair to the architect nor his employer, and that it affords no test of the quality or quantity of the labour bestowed ; and it is now clear that, in the eyes of the law, commission by percentage on work tendered for but not carried out, is "nothing more than a rough-and-ready mode of calculating the *quantum meruit*," to quote the decision of the Lord Chief Justice. Whether legal or not, however, 2½ per cent. on the outlay is by no means an exorbitant charge, as the architect who prepares plans and specification for any building, whether it be carried into execution or not, has to go through precisely the same amount of labour, and he prepares them under the same sense of responsibility. Employers do not, as a rule, understond the *modus operandi* of the architect's business. They appear to be under the conviction that an architect is paid for carrying out his plans, and that the instruments by which he does so are of little or no other value. There is an undoubted misconception on this point. In point of fact, the architect's study and experience is mainly devoted to the planning and general design, and when he has fairly finished his working drawings and written his specification, he has in truth carried out the principal part of his engagement with his employer.

As these misconceptions still exist, and are likely to remain, it behoves the profession, we think, to seriously consider the adoption of a mode of payment more in accordance with the operation of the law applicable to cases of debt arising out of contract. The law as it stands requires the architect to prove the reasonableness or fairness of his claim if resisted, if no specified sum is agreed upon, and it is the difficulty of proving this in many instances which so hardly presses upon the professional man when no amount has been agreed between the parties. The testimony or evidence of members of the profession then becomes necessary; but it may be worth remarking, as the architectural mind is not always legally constituted, that the courts of law are not disposed to admit as evidence the Schedule of Charges of the Institute of British Architects, or any such body, except when such Schedule has been agreed to by the parties in case of dispute or difference. We think a great many architects are under the impression that the schedule of charges adopted by the Institute affords them the security they require; but in the special circumstances to which we are referring this idea is erroneous. Nor can it be pleaded the law is arbitrary in not admitting evidence on one side, though sanctioned by authority, under the special circumstances. For it is only reasonable, that though the Schedule is binding on members of the Institute, it should not be binding on those who are not members, and therefore it would not be so on the employer who had not known or assented to any scale. It therefore appears obvious that the architect's claim can only be supported by proper witnesses, and yet it does not follow that because the jury refuses to take the Schedule as evidence of a reasonable charge, the architect may not avail himself of citing it. There appears ground, from these considerations, for a reorganisation of the system of payment of architects, and the recent decisions in the cases of Wilson v. Landless, and Shields v. Earl of Bective, lead us to the conviction that the sooner the profession agree to charge for their plans as payment for work done, the better. This would require, as Mr. Aitcheson pointed out in our columns, a careful entry of time employed in making drawings by both principal and assistant; but the result, in most cases, would be to increase, rather than diminish, the charges of architects.

Further, there is a remissness on the part of architects generally to undertake the necessary formalities before commencing any work. We lately drew attention to a case (Hunt v. Wimbledon Local Board) showing the absolute importance of the formality of sealing a deed where a public body is one of the parties, as a corporation can only contract under seal. How many architects have not lost months of study and labour in preparing plans for committees, who afterwards turn round and assert their non-liability? A larger number are engaged who never think of getting a valid retainer before they commence, and then wonder how it is that if their employer abandons the undertaking, or engages another professional man, they have no legal claim for services rendered. It is a maxim of law that, till both parties are agreed, either is free, and yet architects continually accept work without the knowledge of this elementary principle. Our "Intercommunication" furnishes abundant evidence of the very incautious manner in which young architects proceed, and the question of the liability for the preparation of preliminary plans turns mainly upon this point.

There is another and frequent source of disagreement between the employer and architect, which mainly arises from want of a proper understanding, and which the now almost historic case of "Moffatt v. Dickson" illustrates. We refer to the employment of an architect to prepare preliminary drawings. In the case we have cited, a committee agreed to pay a certain sum to the architect for his services in examining site, preparing the requisite preliminary drawings for approval, &c. Three sets were furnished, but the committee did not approve of either of them, and they, therefore, rejected them and determined not to proceed further with the plaintiff. Although it was argued the committee had deprived the plaintiff of the opportunity of earning the agreed price, the Court held that a reasonable time had elapsed within which the plaintiff ought to have prepared the requisite preliminary drawings, and that he had failed to do so.

From this important decision it is made clear what the spirit of the law requires, and we also learn that an agreement to prepare preliminary designs, unless carefully framed, places the architect at the mercy of those who have to decide upon his plans. The case of "Moffatt v. Dickson" affords a warning example to the architect. It is doubtless a hard case that he should make several sets of drawings on approval, and yet not receive remuneration; but he does so with his eyes open, and the experience he obtains ought to convince him of the folly of a condition precedent of such a kind.

Equally hard is the case of one who surveys and prepares plans for laying out land for building purposes, and agrees to be paid on a contingency which does not happen—namely, the letting of the land for building. In numerous cases the letting is a matter of chance; the proprietor may die, his executors may dispense with the architect's services, as in another case; or the property may be sold, and the architect has no claim. In such undertakings, there is no legal obligation to pay; but the architect can protect himself in such an event by a clause entitling him to be paid for work actually performed. It is not uncommon for professional men to prepare preliminary plans for public institutions, churches, and building estates, on such conditions as we have mentioned, the only agreement being that if the funds are forthcoming, and the work is carried out or the land let, the architect will be paid. The contemplated event does not take place, yet the architect thinks he should not lose all. An account is made out and sent in, claiming a certain percentage, according to usage; but disappointment follows, simply inasmuch that such an agreement was not binding on the employers at all, under the circumstances.

It is time something should be done to check members of the profession from entering into these rash and one-sided contracts with their employers, and the only way protection can be given is for the societies which represent professional interests throughout the country to agree upon a more satisfactory basis for the payment of preliminary plans, which may be accepted by all practitioners in their own interests. As we have seen, architects place themselves in positions out of which the law cannot help them, by agreeing to do work on speculation, and as long as they are satisfied to proceed on these conditions, they must not be surprised to find their labours underrated by the public, and even the usual charge for commission disputed on the ground that till a building is executed the architect has earned little or nothing.

REFINEMENT AND NEATNESS.

THERE was never an age, perhaps, when matters were made so pleasant as now to the great mass of people who want to seem better off than they are; for never before did every valuable thing find such close and cheap imitations. And this is true not only of the materially, but of the spiritually, valuable. It is not merely that the poorest can make a sham display with false gold and false jewellery, but that the most ignorant can show off with shallow imitations of learning, and the most obtuse with plausible pretences to taste. Everything that is difficult to get has a counterfeit than is easy to get, and this holds good in art matters, quite as much as in trade and manufacture.

Architectural simplicity, for instance, is the last perfection of the consummate artist, and takes a lifetime of thought and study to attain; but everybody can make a building bare, bald, and vacuous, and then pride himself on the "simplicity" of the design. Architectural refinement, again, is not to be had for the wishing; it springs from delicate perception, unwearied care, and perpetual pressing forwards to the better and yet better; but there is a cheap substitute for it within the idlest person's reach, which is often misnamed, and palmed on the world as the real thing. This substitute is common mechanical neatness.

The worshipper of neatness usually talks much of modern civilisation, and thinks those are barbarians who can see any merit in roughness, unexpectedness, and irregularity. That these things can be used to effect great artistic purposes strikes him as absurd, for his central idea of art itself is neatness. Neatness, in short, is the end of

all his labour, the goal which he has constantly in view, and the highest praise that could be written on his tomb would be that he left the world neater than he found it. Whether he is dealing with town or country, with streets or fields, he sticks to the same principles, and aims at the same petty, effeminate results. Trust him with a cathedral, and he will scrape it over, as Lincoln was scraped; trust him with a bit of the primæval forest, and he will drain it, and smooth it, and gravel it, as Epping Forest is now being drained and smoothed and gravelled. It is the work of his life to take the naturalness out of nature, and the manliness out of men, and to make them both appear, not as they are, but as he in his wisdom thinks they ought to be. When, unhappily, such a man becomes an architect, we know on which side to find him; on the side, that is, of tameness, deadness, and dull, soulless uniformity. He has a mild tolerance for the Greeks and Romans, whose work, he considers, was fairly neat, considering their lamentable want of machinery; but the unexpected fancies and shameful irregularities of all subsequent builders, down to the time of the Renaissance, totally upset him. Carelessness, and incompetence, he feels, prevailed everywhere for a thousand years, and the commonest foreman, in these civilised days, does his work with an accuracy and regularity which would make the greatest builders of past ages blush. For he never doubts for a moment that mechanical correctness was their aim, as it is his, only that, living in a dark, uncivilised age, he supposes that they failed to reach it.

If mechanical neatness is art, there is no art workman like the steam-engine, and no age so supreme in its art work as the present one: a conclusion from which the worshipper of neatness, if he had the courage to avow his real opinions, would scarcely shrink. By machinery of one sort or another we can cast, and stamp, and plane with a uniformity never before either attained or sought; and if the human mind really does want, for its satisfaction, to be everywhere presented with long series of precisely similar objects, there are plenty of people now ready to supply it. We venture to think, on the contrary, that this is precisely what it does not want. At first sight, no doubt, regularity is striking; but the question in art is not what strikes most at the first glance, but what bears looking at longest. To bear looking at long, every object of art must have, as every object of nature has, an all-pervading irregularity behind its regularity; a constant freshness and unexpectedness gained by everlasting deviations in one direction or another from the typical form. Every leaf of an oak-tree is recognisable as an oak-leaf; yet every leaf deviates in one way or another from the ideal oak-leaf shape, and no two leaves are alike. How much neater if they were all stamped out uniformly, in pastry-cook fashion, and stuck on to a tree with equidstant branches at equal angles all round its trunk! This is our neat man's idea of art; and though oak-trees are intractable, buildings are not—as witness his triumphs in our London streets. The oak-tree is coarse and unrefined, he thinks; though good enough, perhaps, for the country; but the system on which it is formed will not do for districts of high civilisation, such, for instance, as Whitechapel and Walworth.

In real art there is a place for roughness and for smoothness; for regularity and irregularity; for unevenness and for neatness; they are all means to an end, and not, as some people make them, ends in themselves. The neat man picks out his bricks of uniform colour, or daubs them over to make them uniform, and finally paints upon them a thin imitation mortar-joint. His work is raw, false, and offensive; but he rejoices in it, because it looks neat. The architect of old, building in brick, did not make it his aim that the work should be neat or not neat. What he aimed at was that it should be strong and beautiful. Brickwork with thin joints is not strong, and a flat mass of unvaried brick-colour is not beautiful; so he had thin bricks and thick mortar-joints, and gave to the whole mass, for strength and beauty, as much texture, light and shade, and variety of tone as it admitted of. He filled his work, in short, with delicacy and refinement, not with neatness, and so it offends the multitude who can appreciate the last quality and have no eyes for the former. The sculptor of old, carving a bas-relief for some lofty position, did not make it his aim to finish his figures neatly or not neatly; he meant them to look right when fixed, and to stand out with life, character, and expression; and so he left the surfaces nearly flat, and cut the edges back at right angles. The neat man, if misfortune has made him into a sculptor, never thinks for a moment about the effect of his work when it is up; he rounds, and smooths, and scrapes, and polishes it, and so will never do anything that any mortal cares to look at, as long as files and scrapers and sandpaper endure. The mosaic-worker of old, again, did not aim at setting his mosaic neatly or not neatly; he was thinking about something a good deal higher, namely, the effect of the picture when finished. To get tone and texture he broke up his material into bits of all sorts and sizes, fitted them closely where evenness of surface was wanted, put them wide apart where rawness of colour threatened to intrude, turned them artfully round this way to catch a high light, and artfully the other to deepen the shadows, and the force and refinement of the work are admired for century after century. At last our intelligent age arrives, the great testing time has come, the neat man makes his appearance, and laying a straight-edge across the face of the mosaic, declares that there is not a bricklayer in London who would not have done it better.

FLOODS.

IN the United Kingdom and in other countries the cry comes of the waste and damage caused by the heavy rainfalls, generally more or less prevalent during this season. Whether or no the downpour is greater or less than in past years does not materially affect the question of quality or extent of damage sustained, more particularly by those interested in land and its profitable culivation. The dangers to and loss of property are, however, in a great degree concentrated, and the general damaging influences of the floods sustained in the low-lying lands through which the swollen streams and rivers hasten with accelerated speed and volume to the sea. Hitherto such loss has been borne with an almost Oriental apathy or indifference, the sufferers bowing meekly to the periodical visitations of Nature's destructive agencies, disregarding in such circumstances the remedial means which might readily be applied for their mitigation, if not permanent avoidance.

A run through the Midland districts of England by either of the three leading railways having their termini in London, will indicate that in the counties of Oxford, Bedford, and Stafford a chronic state of flood prevails for many months of the year. The cause of this congestion, as it were, is not difficult to find, for the tortuous character of the several streams passing through these counties indicates with too much certainty that during abnormal rainy seasons, neither their capacity nor direction are in keeping with the duties thrust upon them under such circumstances and conditions. It may be considered that in streams or rivers so circumstanced, regardless of riparian rights of feudal or other equally obnoxious origin, they cannot, during the seasons of flood, pass on the swollen stream with the needful velocity. How, then, is this destructive waste to be overcome, and how are the requisite measures for its permanent cure to be provided? Hitherto remedial measures have been offered in increased resistance to the concentrated and impeded flood, or in altering the direction of the streams, so as to improve their velocity, and lessen the friction caused by the eddies and other obstructive causes, due to the winding character of their course.

Rivers debouching into the sea may be regarded as the ultimate channels which return again to the ocean the evaporated water that from various altitudes descended in the state of rain, after being collected from affluents and tributaries, gravitating by the universal natural law to the source from whence they had originally sprung. Rainfalls in mountainous or elevated districts are greater than those in the plains, and if the high lands were provided with catch-water basins or reservoirs, the damage caused by the impetuous rush of waters to the sea, would, if not averted, be at least considerably mitigated. Every river and stream has had its geographical position accurately defined by nature, and its gradual progress and ultimate settlement is easily traced in the geological periods through which it has passed. Making allowance, therefore, for the amount of water which may be evaporated and absorbed during the seaward course of a rainfall, a pretty reliable approximate estimate may be formed of the quantity of water which must enter the natural channel of outpour to the sea. There is no such sensible consideration of this question, however, because there is not, under existing laws, any remedy open to the flooded landlord or farmer whereby he may receive compensation for the damages sustained by the uncontrolled water running off the land of his more elevated and fortunate neighbour. Under certain conditions, one mine-owner cannot flood his neighbour's underground workings without incurring serious pecuniary responsibilities, and it is equally reasonable, we would imagine, that one landowner should be under the obligation to prevent damage to his neighbour, caused by his own avertible negligence.

From our point of view the damage so fruitful of serious consequence to many at this season is capable of controlment, not only with advantage to the sufferer, but it may be accompanied with undoubted benefit to him who, it may be unconsciously, inflicts on his neighbour a substantial and, so far as he is concerned, under present circumstances, an apparently unavoidable wrong. While this course of periodical damage is proceeding the landowner or farmer in the upper districts is committing a waste and loss to himself, for if the water which causes the difficulty had been carefully conserved, it would, in the seasons of drought, prove beneficial to his own parched lands. Why not, then, in the districts surrounding the most fertile lands which receive the waters, organise a system of contoured reservoirs at the most convenient and beneficial height? Such an arrangement, not necessarily of an expensive character, would check the flow of water and hold it in readiness for the dry season, or, at all events, to meet the requirements of irrigation which might form an adjunct of any measure of this kind. The higher the altitude the greater the rainfall; unavoidably so from fixed and unalterable natural laws, and it is there, in this climate at least, that the more sterile soils are found. The cost of the needful land, therefore, to catch and store rainwater, would not be high, while reservoir construction might be, by the agency of concrete, carried out at a comparatively moderate outlay. The site

of reservoirs, as also their form and extent, would be controlled by the divisions into districts of each particular locality, so that the present course of ditches and streams would still, in an improved form, provide for the natural drainage of the soil, and nothing more. The accumulated and carefully-stored water of the reservoirs would be reserved for distribution in seasons of extreme drought, or if in sufficient quantity, used for irrigation purposes. A rainfall thus put under profitable subjection would, while removing the dangers of floods at, perhaps, far distant points, prevent the waste of soil and artificial fertilising agents in the immediate locality of its storage. Thus, while contributing to the protection against destructive floods at a distance, such an arrangement would secure the means of increased fertility at home. The picture thus outlined may be, by some, regarded as too sanguine, and somewhat speculative in character, although we believe it only requires a moderate amount of concession all round to effect its realisation.

The machinery of such a scheme would of necessity require to be of an elastic and all-pervading kind; for unless perfect unanimity prevailed amongst the parties interested, no satisfactory progress towards its successful prosecution could be possible. Governmental assistance and control, under such a system as that which regulates and measures the subsidies to local boards, for sanitary and other schemes, would be the most desirable. The bondage of the land, and those who own it, generally speaking, would be an insuperable bar to progress of any satisfactory kind; and, therefore, the first step would be of necessity a legislative measure, clearing the way of all sorts and kinds of agrarian enthralment. Freedom from local interference, and security to guarantee the best system or plan to effect the object desired, would clear the way for the engineer and his constructive associates to perfect, in the most approved manner, the best and fittest system of water-conservation. Concrete reservoirs and conduits of an inexpensive but substantial character, covered in to prevent evaporation, and large open lakes or ponds, in which fish may be bred and grown, would not only effect the object desired, but render possible the cultivation of some barren soils now outside the pale of useful or profitable employment. There could be no better opportunity than the present for a successful handling of this most important question; for the landed interest, and those within its influence, are in such a condition as must compel them to assist a measure of this kind, calculated as it is to remove obstacles which greatly interfere with the profitable use of some of the richest lands in this country.

Engineering science is sufficiently conversant with the details of such a comprehensive measure that would enlist its services in this wide direction, to which hitherto it has but sparingly contributed its beneficial influences. Expensive works are not necessarily required to carry out the details for the purposes of such a scheme as appears to us desirable to avert the waste and losses we have pointed out. The cultivation of the land of this country has not been hitherto conducted on the best lines to secure profitable returns for capital invested, simply because the relations between the owner and the tiller have not been based on a permanent footing, or else wanting in the most essential condition of sensible mutuality. Between these two opposing forces, the soil—the common heritage from a bountiful Nature—is in danger of reverting to its pristine barrenness, because of the breakdown of a system out of harmony with national progress and true commercial development. The farmer and his lord have generally considered that the cultivable land of the country and its prosperity, or its converse, were matters with which they only were concerned; but the early future will prove that, in the circumscribed area of our country, teeming with a willing and industrious population, the land cannot be said to be utilised where the first efforts of its cultivation is to denude it of the labour by which it ought to be cultivated. Big or small farms is not so much the question as that the best results should be forthcoming, and they cannot assuredly be when such floods as we see from day to day recorded prevail. Not only are these occurrences opposed to profitable land-cultivation; but they, in even a more disastrous manner, cause a great destruction of industrial property in towns and neighbourhoods built on the banks of rivers which, from ignorance or apathy, are permitted to flood and overflow.

There is abundance of engineering ability in this country not at present too profitably employed, and we trust that our remarks on what we consider a most important subject may lead to an active consideration of the conservation of rainfalls and controlment of disastrous floods.

METROPOLITAN RATING.*

THERE are few persons not interested, more or less directly, with the assessment of rateable property, and a handbook giving in a concise form the principal provisions of the Valuation (Metropolis) Act, 1869, with a summary of the appeals recently heard before the Court of General Assessment Sessions, must be of value to all who desire to make the assessment of rateable property more uniform. Mr. Edward Ryde's treatise has become a recognised textbook on the subject, and a new edition has just been issued by Messrs. Crosby Lockwood and Co., revised and brought down to date by Mr. Edward Ryde and Arthur Lyon Ryde. Besides giving a synopsis of the Act, the present edition furnishes a complete record of the proceedings of the Court of Sessions from 1872 to the last Court of 1880. The author's reputation as a valuer is a sufficient guarantee of the reliability and value of the work, and the decisions of the Court are given in many important cases of appeal. For the information of those who have not read the Act as applied to the assessment of property in the metropolis, we may furnish a few particulars. As regards the disputed question as to the definitions of "gross estimated rental," and "net rateable value," these terms are defined as follows in the Act:—"The term 'gross value' means the annual rent which a tenant might reasonably be expected, taking one year with another, to pay for an hereditament, if the tenant undertook to pay all usual tenant's rates and taxes, and tithe commutation, rent-charge if any, and if the landlord undertook to bear the costs of the repairs and insurance, and the other expenses, if any, necessary to maintain the hereditament in a state to command that rent." "The term 'rateable value' means the gross value after deducting therefrom the probable annual average cost of the repairs, insurance, and other expenses as aforesaid." These definitions are important. The digest of the Act given by Messrs. Ryde, deals with the various provisions in due order. As regards making of valuations, a new "valuation list" of each parish is to be made every fifth year, *i.e.*, in the years 1870, 1875, 1880, 1885, &c.; a supplemental list is to be made if necessary in each of the first four years of every succeeding period of five years, containing the alterations which have taken place, and hereditaments affected by them. It must be remembered the term "year" in the Act means the twelve-month commencing with the 6th of April, and ending with the same date in the succeeding year; every person ratable is, when required, to fill up, and make a return on a form supplied by the Surveyor of Taxes to the overseers, as to the rent he pays, the owner of his house, annual value, &c., and the Assessment Committee may also require a return at any time. Objections can be made before the Assessment Committee within 25 days of the deposit of the list, by any person who feels himself aggrieved by reason of the unfairness or incorrectness of the valuation, or by reason of the improper insertion or incorrectness of any matter in the valuation list, or by the omission of any matter therefrom; but the notice of objection must specify the correction the objector desires to be made. Any ratepayer, surveyor of taxes, and any overseer with the consent of the vestry, who may feel aggrieved by any decision of the Assessment Committee on an objection to which he was a party, or by any decision of Special Sessions, may appeal against it to the Assessment Sessions. Every information for these purposes, and on the proceedings on appeals are given in the synopsis of the Act, and the schedule of deductions to be made from the gross value will be found useful in estimating the rateable value. We here give the leading deductions. For houses and buildings or either of them without land, other than gardens, where the gross value is under £20, a maximum deduction per cent. of 25, or 1-4th, is allowed; for houses and buildings valued for the purpose of inhabited-house duty, where the gross value is £20, and under £40, it is from 20, or 1-5th, to 16⅔, or 1-6th; for buildings not liable to inhabited-house duty, and are of a gross value of £20, and under £40, the deduction is the same; land with buildings (not houses), the deduction is 10, or 1-10th, and land without buildings 5 per cent., or 1-20th. Mills and manufactories are a class for which a rate of deduction of 33⅓, or 1-3rd, is fixed.

Some important decisions in respect of the rate of deduction to be made from the gross value are furnished; Messrs. Waterlow and Sons' appeal in 1871 is a typical instance of the blunders made by the earlier Assessment Committees, especially in the deductions allowed for repairs to machinery; other decisions concern the notice to be given to the ratepayer whose assessment has been increased by the committee without the notice required by the Act; in one case cited the Court gave the appellant's costs. A more useful case to the surveyor or valuer, called upon to value property, is given in the appeal of the Corporation for Middle Class Education, against the assessment of the Holborn Union Committee. The Committee had assessed the property upon the basis of cost, the land being assessed upon a calculation of 3 per cent., and the school-buildings at 5 per cent. upon cost, or £1,500 gross, and £1,250 rateable value. Mr. Clifton had valued the property at £750 rateable value, as the highest rent the place would fetch in the market for any purpose; the building measured 7,344 superficial feet, and contained 30,000 super. feet of floor-space, the playground measured 37,200ft. The building he valued at £600, the playground at £300, making a gross value of £900, and deducting one sixth, £150, the rateable value was £750. Mr. Ryde, estimated the gross value at £300, and the rateable at £250. On the other side the respondents took the actual cost of land at £25,000, and the building cost of £15,000. The court altered the list by reducing the gross value to £1,080, and the rateable to £900, clearly showing that cost was not made the measure of rateable value. There is more reliance to be placed on rent actually paid, and the decision in case cited, of Lord Carington's appeal against the assessment of

* Metropolitan Rating: A Summary of Appeals heard before the Court of General Assessment Sessions. By EDWARD RYDE and ARTHUR LYON RYDE. 3rd Edition. London: Crosby Lockwood and Co.

his house, shows that the rent paid was considered nearer the value. In another instance, the judge expressed an opinion that the parish should show that the extra value belonged to the situation. The drift of these decisions of the Court appears to show that the rent which a tenant can afford to pay for certain premises is a more correct criterion of rateable value than the actual rent paid in all cases.

The rating of railways forms a large part of the appeals against Assessment Committees, and the cases cited by the authors, particularly the details furnished of valuations, are extremely useful. Mr. Ryde's evidence given in the appeal of the South Eastern Company, against several assessment committees, may be mentioned. He there estimates the cost per carriage mile of maintaining and renewing narrow-gauge ordinary carriages and waggons at a farthing, and the rateable value of all the stations on that line is estimated at 5 per cent. on the gross receipts of the company. "It was always his practice to consider that the tenants' capital required in each parish was a sum equal in amount to the gross receipts in that parish, and as a practical man he believed this to be infinitely the most practical and satisfactory method of treating the subject." This method of arriving at the tenants' capital was adopted by the Court, which reduced the rateable value of the line in the parish of Lee, the decision ruling many others. The Court decided that maintenance and renewal of way should be calculated on the *carriage*, not the *engine*, *mileage*; also that where interest on cost of construction is taken to be the rateable value of a station, the rate should be 5 per cent. An important reservation, however, is made by the author, who shows that this rate cannot fairly be taken as applicable to all stations, such for instance as the little-used Blackfriars Station, of the London, Chatham and Dover Railway. To assess such a station as equal to 5 per cent. upon its cost, would be to "assess it at an annual value which it would be unreasonable to expect any tenant to pay for it." Mr. Ryde's valuations of the London and South Western Railway Co's. stations at Waterloo and Vauxhall afford a useful hint. The valuation made on behalf of the Assessment Committee showed that nearly half the rateable value assessed was made up by adding the cost of the brick viaduct upon which the station stands, but, as Mr. Ryde points out, the most valuable station for a tenant is one on the natural level of ground, and any expenditure to bring the station up to its level is a deduction from, rather than an addition to, its value. In this case, the rating was reduced from £22,040 to £14,134. The rating of water-works is exemplified by the citation of several cases, and the evidence given on the question of productive mains—those which are tapped by service pipes, and unproductive mains, those not so tapped—is very important.

The rating of gas-works, canals, residential chambers follow, after which are given the supplements containing brief abstracts of cases heard before the Court of General Assessment Sessions, from the year 1872 to the last Court. In these we find many decisions of value, as that on the appeal of the governors of St Thomas's Hospital, in which the assessment was made upon the structural value of the property. Mr. Ryde's figures, supported by Mr. H. Currey, and Mr. E. N. Clifton, put a gross value of £6,000, reckoning 600 beds at £8 each, and a ratable one of £5,000, after making the statutable deduction of one-sixth. Among the numerous decisions of the Court, we find a detailed account and valuation given on an appeal of the London Tramways Company. It is obvious that the principle of dividing the earnings among so many distinct parishes, in proportion to the mileage of the route in each, is the one that is most agreeable to common-sense. In another instance, the School Board for London appealed against the rateable value of their schools in Tower-street, the land of which had been estimated at more than the Board's valuation, but the respondent's valuation was accepted.

The case of J. Willing and the Assessment Committee of St Pancras, argued in the Queen's Bench Division, and the judgment of Mr. Justice Mellor, shows that the granting of a license for a mere temporary occupation of the land, such as advertising, is not the kind of occupation to be rateable. These summaries embrace a variety of cases concerning different kinds of ratable property, which will be found of considerable use in future appeals. From what we have already said, and from the evidence furnished in the cases throughout, it is quite clear that the outlay of capital furnishes no satisfactory basis for ratable value, but that the valuer must make an independent estimate of the rent the property should yield. A man or a company may spend thousands of pounds unprofitably and foolishly, and what once might have been valuable may have so far deteriorated by circumstances that it is not safe to assume a fixed or an old rental value. Several cases proving the above remark are mentioned, and the appeal of Sir Dudley Coutts Marjoribanks, is an instructive example of the assessment of a large West-end mansion.

Business premises, factories, and a variety of other buildings, the premises of water-companies, etc., will be found in the summaries of the book, and a useful appendix is given showing the gross and rateable values of the "valuation lists" of the several metropolitan parishes and unions. A comprehensive index is added, and generally the new edition of Messrs. Ryde's work may be accepted as a safe and reliable guide by all surveyors and valuers of property in the metropolis.

SANITARY SCIENCE IN RELATION TO CIVIL ARCHITECTURE.

AT the meeting of the Royal Institute of British Architects, held on Monday evening, the discussion of this subject, arising out of Mr. E. C. Robins' paper, was resumed. The President, Mr. J. Whichcord, F.S.A., occupied the chair, and, in inviting observations, suggested that in the first part of the proceedings members should confine themselves to the general question of sanitation, reserving the consideration of warming and ventilation till a later period of the evening.

A letter was read from Professor HAYTER LEWIS, who had moved the adjournment of the discussion, expressing regret that his somewhat sudden departure from the country would prevent him from being present, for he had proposed to treat the subject in a somewhat different manner from that adopted by Mr. Robins. He would assume that they had a town—London, if they pleased—in which sanitary requirements were perfect, according to modern theories; in which, 1st, the soil and other offensive pipes should be well ventilated; 2nd, the admission of foul air from the sewers into the house-drains should be prevented; 3rd, the sewers themselves should have their foul gases carried off by ventilating openings; 4th, the storm-waters should be conveyed away by a separate system of drainage; 5th, the smoke nuisance should be abated; and 6th, the foul contents of sewers should be returned to the land in place of being hurried away from it to poison our rivers. There were in London about 550,000 houses, and they would have in that case nearly two million ventilating pipes discharging into the air. These pipes must be prominent, and yet could scarcely be treated æsthetically, so as to indicate their purpose. He ventured to think that these pipes would not have a much more agreeable aspect than the present chimney-pots. Further, from the absence of storm-waters, the contents of sewers would be less diluted, and more liable to become offensive. The absence of carbon and sulphur from the air, caused by the abolition of smoke, would deprive the atmosphere of many of the oxygenising properties it now possessed, and make it more unhealthy for people to breathe. It seemed to the writer that they ought to put before engineers a problem of how the germs of disease could be destroyed before passing into the air, and the method adopted by Major-Gen. Scott for making cement seemed to him to be a step in the right direction, in connection with the use of earth-closets and dry systems of removal.

Mr. GILBERT REDGRAVE read a communication from Major-General Scott, C.B., who said it was important to prevent the creation of sewer-gas. In the small-pipe system of Mr. Isaac Shone this evil was reduced to a minimum; but the danger existed in every water-carriage system, and it was desirable to obviate the formation of gas as far as possible. Any plan by which the foul liquid could be deodorised at an early period of its flow must have advantages. His proposal was to clarify the sewage at the highest point of the town, and so to neutralise its noxious qualities at an early stage, instead of at the outfall. The writer went on to explain in detail his plan, as carried out in the Ealing experiments, showing how lime could be poured, in measured quantities, from hoppers into the sewers at numerous points, and claimed that a clear effluent would result, while the residuum could be utilised for cement-making.

Mr. ROGERS FIELD, B.A., C.E., remarked that the letter from Prof. Lewis seemed to go to the root of the whole question of true sanitation. He had asked: You have a great number of ventilating pipes from your houses poisoning the air of the metropolis; can you find no means for preventing the exit of foul gases? He believed that it was perfectly easy to prevent these foul gases from being formed. They resulted during the decomposition of organic matter, and hence the aim should be to immediately remove all effects of organic matter before it had time to decompose. The simplicity of this was so great that its paramount importance was in danger of being overlooked. If sewers were properly constructed, flushed, and ventilated, there was practically no smell from them; any offensiveness proved that the discharge was impeded. It was a mistake to imagine that the foul emanations arose exclusively or principally from the sewers; they occurred quite as frequently in the house-drains, and he had seen instances in his own practice. The house-drains should always be so cut off from the sewer that the former could be dealt with separately, and even then keeping it sweet, while practicable, was not easy of accomplishment. The endeavour should be to make everything self-cleansing. It was foolish to have too large a drain, as then it retained more foul matter. No absolute rule could be laid down; but he did not find it desirable to make the house-drain or siphon in a large mansion more than from 4in. to 6in., and for ordinary houses the size might be considerably less. With reference to the fall of drain, the rate allowed by many builders, and even architects, 1½in. to 10ft. was quite insufficient to keep the drain clear; about twice as much fall should be given. If a self-flushing apparatus were used, however, the incline might be very much less; in a large mansion with a 9in. pipe flushed once a day he had been successful with a fall of but 1 in 330. The only mode of insuring that drains should be truly laid was, he had found, to adopt Mr. Rawlinson's suggestion, that all drains should run in straight lines from point to point, with facilities for inspection and cleansing at every change of direction. It was not enough to deal with the drains only; the w.c.'s should be self-cleansing. The D-traps were terrible offenders in retaining foul matter, and the use of these and of pan-closets should be forbidden. He was glad to see they were not allowed by the new regulations issued by the Local Government Board, and he hoped they would soon become obsolete—except in London, where the Public Health Acts did not operate. The modern difficulty in sanitation was that there were such an immense number of apparatus that few people could tell which were good and which bad, but they could always be tested by the smell—by applying the nose to the ventilating pipe. The Sanitary Institute had organised an exhibition, in which prizes would only be given to closets after trial, and he called attention to this mode of adjudication as furnishing some guide

and guarantee to the public. He could not agree with Mr. Robins that the sanitary principles now insisted upon were carried out by architects many years ago. Only five or six years since the plan of disconnection was met by a series of objections, which might now be said to have been effectually answered. He had found, from inquiry, that in no case where an external soil-pipe was well constructed was it ever frozen up, and this was the experience of Mr. Norman Shaw, Mr. Eassie, and others.

Mr. EWAN CHRISTIAN asked how individuals could deal with the water-companies; because if the public were compelled to adopt the waste-preventers, or rather "waste promoters," stipulated by the companies, people would either be unable to adopt the flushing recommended by Mr. Field, or would be tempted to alter their fittings directly the inspector turned his back on the house. The Legislature would have to deal with these gigantic monopolies, in order that we might adopt flushing, which he agreed with the last speaker, was very necessary.

Mr. WALLACE PEGGS spoke of the advantages of disconnection of soil, bath, and sink pipes, and of providing manholes for inspection. The latter could be cheaply built in Portland cement, but for the future he should line them with white glazed bricks. He stated that he had recently found in a 16th-century house what he believed to be the earliest-known instance of disconnection. Beneath the sink he found a hollowed stone ending outside the house, with open chamfered lip, from which the waste water fell into an open trough. He thought, from a recent inspection of the Bedford-park estate at Turnham-green, that Mr. Norman Shaw's system was there placed under a disadvantage.

Mr. ROBERT RAWLINSON, C.B., chief engineering inspector to the Local Government Board, said he thought he might claim some credit for the system of house-drainage now generally adopted —small pipes laid in direct lines, with manholes at all changes of direction, for he had advocated it since 1850, and several points in it had been suggested to him by one of his best assistants, Mr. Hugh McKie, now borough surveyor of Carlisle. It had been wisely said that to know our mistakes was the first step towards correcting them, and he would, therefore, mention a few which had come under his supervision. One of these was to carry the drains entirely under the basement of a house. He could refer to a house in Kent, built within the last six years for a Cabinet Minister, which became so unbearable within twelve months from the state of the drains and their bell-traps, that he could not live in it. The speaker could not tell the architect's name, for he had never inquired. When he was called in he had it remedied, first by having every drain that could be reached pulled out, and in the cases where they could not be reached under the floors to fill them up solid with concrete to the outside wall. All the bell-traps were removed, the cesspools emptied and filled up, and ventilators put on to the pipes. Another case was the seat of the Duke of Sutherland. When he was requested by his Grace to visit it, he found every w.c. in the castle except one stopped with brown paper, and it was explained to him that when company were staying there the stench had been so awful that it had been necessary to get rid of all the guests and close the building. He found a splendid fall from the house to the sea; but there were several cesspits, and the drains went under the premises, and a clerk of works had carefully closed every opening from the cesspools with Portland cement, so as to hermetically seal the foul gases within the drains. He at once had all the cesspools laid open and the closets reopened, and the housekeeper told him next day that the house was as sweet as possible. On his advice every cesspit was filled up with concrete, the drains relaid, and a ventilating shaft, freely open, was carried up in a plantation. The remedy had proved effectual, and the total cost was less than £50. He had come to the conclusion that it was not necessary to place a drain-pipe beneath a house, even if it were as large as that in which he was unfortunately situated. He was supposed to teach the public on sanitary matters, and they came to consult him along a corridor which was pervaded by a most abominable stench. He complained to H.M. Office of Works, and they referred the matter to the Treasury, and the consequence was that he was told he was a very improper public servant, and was called upon to apologise. No part of a drain should be laid in such a position that it could not be examined or tested except at great expense and inconvenience. By the introduction of manholes it was quite possible and easy to provide such means of inspection that the householder was always master of the situation. As to the ventilation of sewers, the letter from Professor Lewis read that evening only showed how dangerous was a little knowledge. There were hundreds of miles of sewer in London, most of it well laid; but, unfortunately, where the fall was least, as in Belgravia, it was often in the worst condition. If London was not dealt with by some system of flushing, the main drainage works would, in future dry summers, prove a curse, and not a blessing. Such a system could easily be arranged, and would not necessarily be very costly. The cause of emanations from sewers was bad construction — either leaky joints which allowed the liquid to escape into the surrounding soil, and retained the solids, or the dimensions were too great for the volume of water to scour them. But a sewer need not be so foul, and he remembered hearing a distinguished chemist at the meeting of the British Association at St. George's Hall, Liverpool, state that he had analysed the air in the large main sewers, which were well ventilated, and found it actually purer than that in their meeting-room. It was constantly objected that sewer-ventilators stank, and no doubt they did; but it was a thousand times better that the ventilators should stink than that the foul smells should be sealed up in the sewers. When sewers were first laid down, about half a century since, they were followed by outbreaks of typhoid fever, in consequence of the omission of ventilators, and the result was that people were forbidden to drain into them, and cesspools were made, in compliance with an Act of Parliament. Some people wished to introduce the pail, dry or wet earth, and other so-called dry systems; they had his cordial sympathy, but he was convinced they would soon abandon the attempt. The pail system was at once troublesome, inconvenient, and costly. A few weeks ago, when at Rochdale, he was told by the town clerk and surveyor that the town suffered a dead loss of £10,000 a year, although the refuse sold at from £3 to £4 per ton. They were often told that it was wasteful to throw into the sea the material that would enrich the soil; but it needed but a slight knowledge of political economy to understand that if 20s.-worth of sewage cost 30s. to put upon the land, there was little advantage in utilising it. Many towns still utilised the sewage, but in no case was there a resultant profit. The small-pipe system of water-carriage was the most economical yet introduced, and it had been carried by the Americans further than here, as at Memphis, where a town of 40,000 inhabitants was sewered by 9in., 6in., and 4in. pipes, the rain-water being carried away over the surfaces, and the plan worked admirably. Small pipes were adapted at Alnwick Castle in Northumberland, although subject to violent floods, where an 8in. pipe carried away the sewage, where a 12ft. tunnel would not have sufficed had the storm-waters been permitted entrance. A good instance of the advantages of the system he was advocating was Earl Spencer's mansion in St. James's-street, which was now as free from the sewers of London as if it stood in the middle of a park ten miles away.

Professor KERR declared it was very clear that the engineers, and not the architects, had brought about this most pestiferous system of sewerage of which they had heard, and that the blame should and ought to rest on them. But as an architect he must be allowed to confine his attention within the four walls of the house. Looking at the question, then, as architects of houses, there was no need to consider these prodigiously complicated appliances which opened out an ever-lengthening vista of increasing cost, increasing trouble, increasing ingenuity, and increasing failure. There should be none of these appatus nor any plumbing inside the house; they should be driven out, bag and baggage. It was those ingenious gentlemen who talked about scientific plumbing—a modern race who had sprung up within his own recollection—who had caused all this trouble, a nuisance which had gone increasing till they were actually asked to look at a number of w.-c.'s which had been tried and tested for prizes. The speaker exhibited and described a large plan, showing the mode in which he proposed to deal with the drainage plan of an ordinary London house. It was of no use telling people they must keep their drains outside. They could not do it in London, for the water and sewering pipes came in from the street in front and caution required that the sinks, closets, lavatories, and other places where the water was used and poured away should be at the back. The pipes must, therefore, go from front to back, and this he should do in a subway carried under the basement. At the rear of his ordinary house he had planned an annexe containing all the plumbing, the closets, sinks, bath-rooms, &c., and having over it the cisterns. In one external shaft open at the top he could carry up all the gas and water-pipes, the soil-pipe, &c., and at the street end of the subway the engineers could arrange all their own appliances. This arrangement, combined, of course, with the air-proof concrete bed under a house, now compulsory in the metropolis, would enable the architect to keep all filthy appendages at the rear of the premises, and outside the better part of the house. He was aware that to make an impression on the public it was necessary to exaggerate the case; but he must deprecate the immense amount they had heard during that discussion; and he would plainly say he did not believe what Mr. Rogers Field and others had said about sewer gas. He had never yet known a case of typhoid fever which could be distinctly traced to the drains. Still he fully agreed that sewers and drains should be ventilated as fully as possible; if people did not like the smell, they must submit to it, for it was their own fault.

Mr. R. B. GRANTHAM, C.E., remarked that his occupation was that of constructing main sewers, and he must leave the consideration of house-drains to others. The difficulty of ventilating sewers through long and narrow streets was very great. He had now to construct sewers in an Italian town of this character, where he was trying ordinary ventilating pots set on shafts in the streets, and if they did not answer he should place the ventilators by the sides of the house-chimneys. He was acquainted with the experiments at Ealing, made by General Scott, and described that evening in his communication; but although he had frequently discussed the matter with General Scott, he had not yet heard that the plan was a success. An apparently clear effluent was produced, but at a great expense, and he was not sure that a sale could be found for the cement. He was in favour of small sewers, if good flushing could be depended upon; but this was often exceedingly difficult to obtain, as the lowest parts of sewers were laid to a flat gradient.

Dr. G. V. POORE deemed Professor Kerr's plan of an annexe a good one, but could not see any reason why it should not be brought to the front and treated æsthetically. The last speaker appeared to doubt if there was a connection between sewer-gas and fever; but some three or four years since he saw a boy at a master's house in a public school who was dying from inflammation of the lungs. Finding that another boy had died, and others had suffered from similar symptoms, he examined the drainage, and found that near the boy's cubicle of the dormitory was a sink. This passed outside, and was said to be disconnected; but examination showed that the intelligent builder had connected the waste-pipe to the mouth of soil-pipe, so that the boy had been sleeping with his nose over a cesspool. In reference to Professor Lewis's suggestion that the sulphur and carbon in the air destroyed the germs of disease, he would point out that the proportion of those antiseptics was at any time very small, and he doubted if any respirable air was sufficiently charged with those substances to affect the germs.

Mr. WILLIAM WHITE, F.S.A., thought Mr. Robins's paper ought to have been confined to matters affecting architects. At the recent sanitary congress at Exeter there was a strong desire apparent on the part of several persons to affix the responsibility for defective sanitation on architects, but the attempt completely failed. He carried out in his own house very nearly the plan suggested by Professor Kerr, but there were obvious reasons why he had placed the annexe at the back and not next the street. He had brought the 4in. soil-pipe down to the basement in a 9in. shaft, and provided open-ventilation at the bottom and top; these were inside the house, but had no communication with it. Experiments showed that the current in his soil-pipe was always upward, even during a thick fog and with a low temperature. He attributed

the success of the shaft to the fact that it received the warmth of the house. Mr. Woodhead, of Leeds, and others, declared that there would always be a down-current in ventilated soil-pipes, but he had not found it so. A serious matter was that there were so many diverse opinions upon all sanitary matters, and the whole range of sanitary science was at the present moment in so tentative a condition that it was not easy to decide what was correct and what wrong. In consequence of this, people were undecided in reference to many points laid down as infallible by reformers. At the recent Sanitary Congress they were told that the old pan-closet was the best thing, but that it ought to be burnt out once a year—a pleasant idea for plumbers, but not for householders. How could sanitary reformers expect to influence the public when they heard so many different opinions advanced, and when they saw advertised in their journals side by side very bad and very good contrivances both supplied by some of the best makers in the kingdom?

Lieut.-Col. JONES, V.C., of Wrexham, said he had regretted to hear the remarks of Professor Corfield in the first evening's discussion, exaltiing science and spécialité at the expense of the public, and speaking as if householders who acted on their own responsibility, and to the best of their judgment, must come to grief. He had himself had considerable experience in rectifying the drainage of mansions, and had always experienced great assistance from talking matters over with the occupiers and with their servants. The aim of sanitary reformers should be to spread the knowledge of the very simple rules of health that it was desirable to get as much oxygen as possible by a free circulation of air. There was a great danger of darkening counsel by words. If people were incessantly to be told that they must call in the "prince of sanitary engineers," as some gentleman had been entitled elsewhere, the cause of sanitary science would not make much progress.

Mr. DAWSON moved the adjournment of the discussion, which was agreed to, the President announcing that its resumption would take place on the 14th February.

"BUILDING NEWS" DESIGNING CLUB.

A BLOCK OF ALMSHOUSES.

SEVERAL creditable designs have come to hand for this subject, though we are unable to say that any author has proved fully equal in plan and external treatment. (1) The design which appears to us to most nearly combine the two requirements is certainly that by "Black and White," though we cannot admit it quite satisfies our ideas of concentration or compactness of grouping. The author shows six one-story tenements on one frontage and two on the other. The frontage of each house is 22ft. There is to each a recessed porch with a seat, an inner-lobby, taken out of the living-room 12ft. by 10ft., a small bay-window, a bedroom, 10ft. by 9ft., also in front; and behind, leading out of living-room, scullery with coals and pantry, an enclosed yard, and an earth-closet and dust-bin. The external porches are placed in pairs, and the author has cleverly combined them by a wooden arcaded treatment which is made to stop against each pair of adjacent bay-windows. These also are made features of the elevation; they are simply square in projection, and have gables, which are made to break the main roof. It would have been more economical to have reduced the frontage and have placed the bedroom behind; but, taking the arrangement as it is shown, we find each tenement to be convenient in its internal planning, suitable for either an old man or woman, and self-contained in the back-offices. The rooms are shown 8ft. high, hollow walls are proposed, and the general treatment is plain and suitable. The least satisfactory part of the plan is the corner, which might have been managed more artistically. The seat in the bay-window is useful, and the position of doors is well considered. (2) "Nemo" has also a good plan, based on a similar principle of arrangement, the tenements being one story high, with a living-room and bedroom, one on each side of a lobby-entrance, though frontage is taken up unnecessarily by the 3ft. entrances which are obtained independently of the rooms, instead of being placed together and taken out of the rooms, as in the former case. The block is in one row of six houses, the end ones being intended for two persons, which would be a desirable method of reducing cost, and the author has thus been able to dispense with a return-block. The objection to the plan is that it is only one room deep, nearly all frontage—not the best form of building for comfort or warmth. Another defect is that the bedroom forms a distinct apartment, not communicating with the living-room, but separated from it. In almshouses and cottages; the great point to bear in mind is the reduction of labour in cleaning, and the principle of intercommunication becomes not only admissible, but desirable. Distinct and separated rooms entail labour in attendance, fuel is wasted, and comfort, especially of old folk, sacrificed. The author shows a tub-closet to each house. In elevation the block is suitably treated, with bay-windows and gabled centre and ends, in a plain brick Old English style. (3) "Such a Dog" shows a more economical plan, with a well treated elevation in brick-and-timber work that would make an artistic block; but we find fault with some points of detail. The porches are recessed and taken out of the rooms of each pair of cottages; there is a small pantry in a convenient position, with small windows opening into porch; but the scullery is cramped, and would have been best placed outside, while one water-closet to each pair of houses is not desirable; added to which, the position is objectionable. The corner-house is squeezed up unnecessarily, and its offices placed in an unsuitable position. (4) "Cui Bono" sends an ingenious plan contrived in a small compass and depth. Each entrance-porch is common to two houses. There is a living-room 12ft. by 11ft on either side, a small scullery with fuel-bunker common to both, and the bedrooms, except at the ends, are arranged in pairs between adjacent houses, so that the front bedroom belongs to one house, and the back to the next. Each water-closet, besides scullery and fuel-store, is shared between two tenants; but to this arrangement we demur, as elderly people, once in better circumstances, who are forced by adversity into these domiciles, have a right to expect regard for their individual comforts in such matters. The design is simply and suitably treated externally. (5) "Jack" has produced a characteristic stone treatment of one story, with some good features, separate entrances are provided. The bedrooms are arranged to be lighted from the front, but the separate lobby entrance to them is unnecessary, and the aim the author seems to have had in view is to get all the accommodation in a depth of 14ft. 6in. The living-room is 14ft. 6in by 12ft. 6in; but we do not think the recessed fireplace a good plan in rooms of this kind. One w.c. is placed to two houses. (6) "Nitor" is another single-story arrangement; the author has divided the blocks, one being for men and the other for women. The plan, like others we have named, is shallow in depth; but the living-room, 20ft. by 13ft., is too large, and the bedroom is reached in the same manner as the last described. The pantry on the men's side answers for a scullery. The elevation is pleasingly simple and well adapted; the gables and intervening porches are effectively combined, and made to break the roof along the frontage. (7) "Beta" shows a row of small houses, two stories high, in a trim Queen Anne style. Each house has an entrance leading into a large living-room, with scullery and pantry at back, and two bedrooms over; but the treatment partakes more of a row of small tenements than a block for aged people. (8) "Peace" adopts an economical plan, though rather ill-digested. The living-room, or kitchen, 12ft. 6in. by 12ft., opens into a bedroom 8ft. 3in. by 10ft., one being arranged in front, and the next behind. The pantry and scullery are combined; but there is only one w.c. to a pair of houses. The elevation in half-timbered work is rather ornate. (9) "Edgar." This is a two-storied block, comprising four dwellings on each floor. A common entrance and stairs is provided for the four houses; the bedroom is small, and only one closet shown for two; the arrangement otherwise is compact, and the elevation plain, though rather uncharacteristic. (10) "Lex" is a plan which shows study, but is rather too elaborate. Two-storied blocks for able-bodied men and women form centres in the two respective frontages, the single-story dwellings being devoted to old people. The scullery is reduced to the size of a pantry with a sink; but the objection is the distance of the living-room from the bedroom. (12) "Pupil J." sends a compact block of four dwellings, two stories high, which has the resemblance of a country inn rather than a block of almshouses. The sexes are divided; each tenement has a living-room, with bed recess and pantry; a scullery and w.c. in rear; but the arrangement, if self-contained, lacks room, and there is no distinct outlet to each house, which seems dssirable. "Black and White" (No. 2) divides his block into four parts, two tenements being set apart for married couples, two for males, two for females, and the end tenements for one of either sex. The plan of each tenement shows a chimney-corner to the fireplace which, though cosy, rather cuts up the room; the scullery and pantry are behind, and the bedroom on one side; the houses thus interlap in some cases. Elevation is in a fanciful Jacobean style. "Weaver" arranges his bedrooms in the roof, lighting them by back dormer windows. In this manner he economises area, but the scullery and yards are cramped, and the stairs too narrow and awkward. We do not like the manner the two separate blocks join at the corner. The porches and seats are well-managed and made external features, hipped back to roof. "Arnold" designs a compactly-planned block, or rather two blocks, one being intended for men (two stories) and the single-story block for women. The living-room and bedroom are arranged *en suite*, and there is a common front and back entrance to each pair. The pantries are well-contrived between the dwellings in the women's block; fuel-stores and a wash- and bake-house (the latter in the women's yard) are provided in the rear. External elevation is half-timbered Gothic; drawings are neatly executed. "Snow Flake" is a clever one-story arrangement; the porch and bay window of each tenement is made a projection, and hipped back to main roof; the elevation is neat, in a rather prim style, the details lacking character. We can only pass in rapid review several other designs of merit, but which have lost sight of the primary idea of compact planning and appropriate treatment and grouping. Amongst these we must place "Frank," an arrangement with a canted corner occupied by two dwellings, the bedrooms being obtained in an upper story, clever, but intricate, in the offices; "Bonus Hominus," too costly in character, also planned with a canted corner dwelling; "Hexagon in Circle," a two-storied arrangement in half-timber work; "Clarior e Tenebris," two stories, expensive in style, and more suited for a small villa; "Rex," awkward in planning, and not characteristic in style; "Fortes fortuna juvat," too ornate, with wasted passage-room and cramped scullery; "Endymion," pleasingly grouped and artistic, but not convenient bedroom approach; "Ralph," fairly planned and artistic, but crude in drawing; "Noel," scattered and disjointed in the rooms; "Ambition," "Kismet," bad position of bedroom; "Juvenis," ill-contrived doorways, and too costly exterior; "En Avant," corner arrangement of offices faulty, and uneconomical in entrances, &c. Of other designs which miss the purpose of almshouses, and are meagre and unsuitable in detail, we can only name Sub Judice, B. J., Kairon in Circle, Trial, Norman, Good Luck to your Fishing, Nil Desperandum, Edmund, Lancaster, Utile Dulci, Motto A.

The designs sent in for lectern and font-cover are few and disappointing, leaving us no choice for selection. "En Avant" is the best of the three, though the details are poor. We have received also "Con in Circle," whose design for a lectern shows an enormous stem, with an absurdly small desk. The four struts leaning against the octagonal base have a meaningless appearance, and we can hardly appreciate the artistic value of such appendages. The fleur-de-lis on the font-cover, in stamped leather, are also drawn without reference to the axes or lines of angle-ribs; the details are below par. "Nil Desperandum" No. 2 sends a sheet of more elaborate designs, of the quality of which we forbear to say more than that we are at a loss to know what style they are supposed to be drawn in. The draughtsmanship also is not faultless.

METROPOLITAN BOARD OF WORKS.

AT the meeting of this board on Friday, the Right Hon. Henry Fawcett, M.P., accompanied a deputation, and addressed the board with reference to a memorial presented by the Committee for the preservation of Kings-

land-green, asking that this open space, about an acre in extent, may be maintained as a place of public recreation. There was also a memorial from the Vestry of Paddington, complaining of the sinking by Mr. Brass, builder, of basements to certain warehouses in Queen's-road, Bayswater, to a greater depth than sanctioned by the vestry. A report was presented by the Works Committee, relative to the amendment of the Artisans and Labourers' Dwellings Improvement Acts, and submitting a sub-committee's report and return on the subject, which the committee had been directed to forward to the Home Secretary. The return showed that fourteen schemes had been instituted. In four cases, the schemes for Whitechapel and Limehouse, for Bedfordbury, for Great Wild-street, and for Old Pye-street, the sites had been entirely cleared of buildings, and possession given to the Peabody trustees, under the agreement for sale, and in all but the last case, the new dwellings were in course of erection. The Great Pear-court area had been, and that in White-cross-street was being cleared, and possession would, in both cases, soon be given to the Peabody trustees. In the areas of Goulston-street, of St George the Martyr, of Essex-road, and of High-street, Islington, the final award had been issued, and in the remaining schemes, those of Bowman's-buildings and Wells-street, Poplar, were before the arbitrator; and in those of Little Coram-street and Great Peter-street, claims were being sent to the Peabody trustees. Up to the 30th November last, 9,538 persons had been removed, and 13,126 persons remained to be displaced. The total cost had been £824,497, and a further outlay of £847,871 was anticipated, making a total of £1,166,372. Towards this, £355,894 would be probably recouped, and £80,036 would be saved in the Little Coram-street and Great Peter-street schemes, where the total cost, except about £10,000, would be paid by the Peabody trustees. The nett cost to the ratepayers of the fourteen schemes would then be £1,225,442. The sub-committee reported that they had arrived at the conclusion that no mere amendment of the existing Acts on the lines hitherto followed would avail to render their operation within the metropolis satisfactory, they being both unnecessarily dilatory and costly, and that nothing short of a complete alteration in the whole method of procedure would effect the object in view. In any new enactment the Board should be empowered to draw up plans of unsanitary areas to lay before the Home Secretary. A Government inspector should then hold an inquiry, on oath, in the district, and the Home Secretary should have the power on his report to authorise the Board to acquire all interests in the property. The Secretary of State should also have full power to allow the Board to appropriate any portion of the areas purchased to commercial and other purposes. With regard to the abatement of nuisances, the Board should be appointed the authority for the metropolis, and all expenses should be paid out of the metropolitan consolidated rate. An official referee should be appointed, before whom the owners of unsanitary property should be summoned, and the referee should have the power of ordering that the property be closed within one month if not fit for habitation. Within six months the Board should have the power to remove such property if it still remained unfit for habitation.—The report was approved. It was agreed to enter into a new agreement for the erection of other buildings, instead of an opera-house, on the site between Cannon-row and the Victoria-embankment. A letter was read from Mr. C. Forster Haywood, district surveyor for St. Gile's-in-the Fields, requesting the Board to afford him legal assistance in obtaining the removal of wooden hoarding in front of a house used for advertising purposes, and was referred to the Building Act Committee. It was decided to erect a new fire-brigade station on land belonging to the Board in Great Scotland-yard, adjacent to the building of the Christian Knowledge Society, in substitution for the present station in Chandos-street, reported to be small and inconvenient.

WEB STRAINS IN SIMPLE TRUSSES.

THE current number of the *Transactions* of the American Society of Civil Engineers contains an interesting paper by Elnathan Sweet, member, on "Web Strains in Simple Trusses, with Parallel or Inclined Booms." The author claims to investigate, by a more correct method, the strains in braced structures, than those given in the usual handbooks. The ordinary method of determining the maximum effect of a moving load upon web measures of trusses, "assumes that as the moving load passes over them, each panel is fully loaded before the adjacent triangle in advance bears any part of the load." In single systems of triangulation, this assumption is regarded as erroneous, for the "instant the head of the load passes a panel-joint of such a truss, a part of it is transmitted by the floor system to the adjacent triangle." The author then proceeds to investigate the maximum vertical stresses produced by uniform moving loads in trusses of this kind. Trusses divided into panels of equal length are readily calculable, as the panel-length becomes a convenient unit, and if, in designing the truss, the height and the panel-length are made to have a simple numerical ratio, the panel-length unit facilitates the calculations. The author shows by diagram the mode of finding the greatest shearing strain at any panel-point, and he proceeds to investigate analytically the subject and the stresses on the diagonals. The maximum shears having been found by an equation, the graphical method is applied to determine the resulting stresses in the web members, a method rapid and direct. The author works out a strain sheet for a wrought-iron bowstring girder 90ft. span, with a clear roadway of 18ft., and two sidewalks 6ft. wide, having a rise of 10ft. The arch is supposed to be in the points of a curve of equilibrum, divided into 9 panels, the moving load assumed being 80lb. per sq. ft. of floor-surface, the uniform dead-load of the truss being 400lb. per lineal foot, and of its arch 75lb. The diagram of the frame is drawn to a convenient scale with the diagonals required to transmit the panel-weight to the abutment. The force polygon is drawn to a scale of 10,000lb. per inch. This resolves itself into a very simple figure of radial lines, the vertical line representing to the assumed scale the whole dead and live load. This line is subdivided into eight equal parts (the number of loaded panel-points), and through the points lines are drawn parallel to the several members of the arch, intersecting at a common point. These represent, in direction and magnitude, the stresses in the members of arch to which they are respectively drawn parallel. The horizontal line represents, to the same scale, the stress in the lower chord and horizontal members.

The other subjects discussed are inter-oceanic canal projects, with additional information obtained from recent surveys in Nicaragua, giving maps of proposed canal routes between that lake and the Pacific Ocean, with profiles or sections of the canal, besides minutes of meetings, and reports on uniform tests of cement.

THE LONDON INTERNATIONAL MEDICAL AND SANITARY EXHIBITION, 1881.

THIS exhibition, which has now been definitely entered upon by the Committee of the Parkes Museum of Hygiene, will be held at South Kensington, from July 16th to August 13th, inclusive, Her Majesty's Commissioners of 1851 having granted space for it in their Exhibition buildings. The Medical Congress, which holds its seventh session in London in August this year, has given its cordial support to the undertaking; but the Exhibition Committee have decided not to make any appeal to the medical profession to join in the guarantee-fund, on account of the heavy expenses which the members of the profession must incur in connection with the Congress. All others who are interested in the progress of medical and sanitary science will be appealed to to subscribe to the guarantee-fund, of which the first list, amounting to £655, has just been published.

At a meeting of the Exhibition Committee on Wednesday (Jan. 19) the classification was decided upon as follows:—

MEDICAL SECTION.—1. Surgical Instruments and Apparatus. 2. Appliances of the Ward and Sick-Room. 3. Drugs, Disinfectants, Medical Dietetic Articles, and Mineral Waters. 4. Electrical Instruments and Appliances. 5. Microscopes and other Optical Apparatus. 6. Apparatus of other kinds used in the Investigation of Disease. 7. Appliances used for the Treatment of Sick and Wounded during War. 8. Appliances used in Teaching Medicine; Books, Diagrams, Models, &c.

SANITARY SECTION.—1. Domestic and Hospital Architecture. 2. Planning and Construction. 3. Ventilation, Lighting, and Warming. 4. Water-closets, Sinks, and Baths. 5. Sewerage and Drainage. 6. Water Supply and Filtration. 7. Health Resorts and Sanatoria; Books and Diagrams. 8. Miscellaneous.

All inquiries and communications respecting the Exhibition should be addressed to the Secretary, Mr. Mark H Judge, Parkes Museum of Hygiene, University College, Gower-street.

THE RUINS OF RABBATH AMMON.

IN his new book, "The Land of Gilead," Mr. Laurence Oliphant gives a graphic description of the ruins of Rabbath Ammon as follows:—

For picturesqueness of situation, I know of no ruins to compare with Ammon. The most striking feature is the citadel, which formerly contained not merely the garrison but an upper town, and covered an extensive area. The lofty plateau upon which it was situated is triangular in shape: two sides are formed by the wadies Nuegis and Hadeidah, which diverge from the apex, where they are divided by a low neck, and thence separating fall into the valley of the Jabbok, which forms the base of the triangle, and contained the lower town.

Climbing up to the citadel, we can trace the remains of the moat, and crossing it find ourselves in a maze of ruins. The massive walls—the lower parts of which still remain, and which, rising from the precipitous sides of the cliff, rendered any attempt at scaling impossible—were evidently Ammonite. As I leant over them and looked sheer down about 300ft. into one wady, and 400ft. into the other, I did not wonder at its having occurred to King David that the leader of a forlorn hope against these ramparts would meet with certain death, and consequently assigning the position to Uriah. The only possible point from which that officer could have advanced was at the apex where the low neck connects the citadel with the high plateau beyond, but even here he would have had to charge up an almost hopeless escarpment. This is confirmed by the account of Joab's messenger to David describing the incident, who says, "We were upon them even unto the entering of the gate. And the shooters shot from off the wall upon thy servants; and some of the king's servants be dead, and thy servant Uriah the Hittite is dead also." (2 Sam. xi. 23, 24.) Portions of this colossal gateway, and the massive wall flanking it, at the point where the low neck joins the apex of the triangle, still remain to attest the truth of this narrative, and to identify the spot where Uriah met his fate. Joab afterwards took the lower city, which he called "the city of waters," indicating very probably that the Jabbok was dammed into a lake near the lower city, to which the conformation of the valley would lend itself; but that the citadel still remained, and was upon the point of being taken, doubtless because its water-supply was cut off, and the provisions, after a siege which must have lasted nearly two years, had become exhausted. So David arrives to take part in the final capture of the citadel, and avenges their pertinacious resistance by putting "the people that were therein under saws, and under harrows of iron, and under axes of iron, and made them pass through the brick-kiln." (2 Sam. xii. 31.)

The citadel in all probability contained a temple to Molech "the flame-god," who was the supreme object of Ammonite worship, to whom they offered up human sacrifices; and the brick-kiln here alluded to may be conjectured to have been literally the "burning-place of Molech," where sacrifices were offered, and the children of Ammon made their sons pass through the fire. Perhaps where the temple of Molech once stood the Romans reared that magnificent edifice, the ruins of which still remain to attest its grand proportions; it faces to the east, and was doubtless dedicated either, like that of Baalbec, to the sun, or to Hercules. In either case the religious idea was closely allied to that which is embodied in the worship of Baal and of Molech. The foundations of this temple were about eighty yards by forty, and its façade was composed of four colossal columns the pedestals

of which are still standing, while the columns themselves, measuring about five feet in diameter, are prostrate at their base. Not far distant is what appears at first to be a square tower, but it is in reality a very perfect specimen of a Byzantine church, the external walls of which measure about seventy-five feet each way, and are comparatively in good preservation. The carving and ornamentation inside are very beautiful, but three of the arches which formed recesses have been built up, leaving only one by which it may be entered. Near it was a building which seems to have been a mosque; and there can be little doubt that, though we have no evidence of its ever having been permanently occupied by the Turks, the Arabs have from time immemorial made temporary habitations here, and had a place of worship. It is possible that the massive square tower may have been once a central keep, which was converted by the Byzantines into a church. The columns of another temple were still standing, and near them was an old tower still in a sufficiently-good state of repair to be inhabited by a Circassian family. The citadel seems to have been largely dependent on the lower town for water, o judge by the accounts of its sieges; but there an be doubt that numerous subterranean assages to the valley of the Jabbok existed—the calcareous nature of the rock offering peculiar facilities for excavations of this nature. One cistern, which I measured roughly, was eighty yards in circumference, and about thirty feet deep; and I also saw the remains of a well. The view from the citadel was neither very extensive nor interesting, beyond affording one a bird's-eye view of the ruins in the valley below; the rest of the landscape was so nearly on a level with the fortress that it was somewhat circumscribed. No trees were visible in any direction; and the rolling prairie, though affording good pasture, was bare-looking enough. The hillsides in every direction were honeycombed with caves, which, in former days, doubtless formed the dwelling-places of a very considerable population. Some of these under the citadel apparently extended for some distance, but we had neither the time nor the lights to enable us to explore them.

It would take days to do justice to the ruins of Ammon; notwithstanding the examination to which they have already been subjected, there can be little doubt that a little excavation would unearth interesting results; and that under the heaps of *débris* that strew the valley lie buried antiquarian treasures. The stream, now alive with fish, once evidently flowed between massive masonry embankments, and in places was covered over, for the single arch which now spans it has rather the appearance of having once formed a portion of this tunnel than of a bridge. Near it stand the lofty walls of the grand basilica, its arched entrance leading into a court, now grass-grown, where once the worshippers assembled.

A GUIDE TO THE CATHEDRAL CHURCH OF GLOUCESTER.

THIS is a second edition of the guide-book, published in 1867, by the Rev. H. Haines, M.A., which has been revised and corrected up to the present time by Mr. F. S. Waller, architect, F.R.I.B.A. The present edition has been illustrated with plans and sketches by Mr. Waller, who has introduced several new paragraphs, giving particulars of important additions that have been made to the cathedral since the first issue. These have been introduced into the body of the text, and are distinguished from Mr. Haines's work by marginal letters. The historical notes and chronological table of the dates of the kings and abbots, with the brief descriptions of the various styles, will be found very complete and useful to the archæological student. Thus we have, in one tabular view, the Anglo-Saxon and Norman parts described. Of the work of Aldred, who rebuilt the cathedral in 1058, no remains are left, but the Norman work of Abbots Serlo, Peter, Godeman, Walter de Lacy, and their successors, the crypt, main walls, piers, and round arches, vaulting of north aisle, flanking turrets of transept (except their spires), chapter-house, and abbot's cloister yet exist. The isometrical sketch introduced by Mr. Waller is an important illustration, and shows the remains of the old Norman church as it existed in the 12th century, which have now been encased with additions of later centuries. In the view all these additions have been removed, so that the visitor or student may see at a glance the existing parts of the old Norman church of the 12th century. Mr. Waller, in the appendix, makes some useful comments upon this sketch. He shows that the builders who made additions subsequent to the 12th century, made use of the old Norman foundation without misgiving. "The original Norman tower," says the author, "was probably somewhat similar to that at Tewkesbury Abbey, and might have been about one square in height above the apex of the then roof of the choir. This tower was taken down, and in the 15th century the present tower was erected, of much less thickness of masonry, no doubt, but of at least double the height, as measured from the choir-roof; and the whole of it is borne on the original 12th-century foundation, assisted, it is true, by flying buttresses carried skilfully and with great picturesque effect across the openings in the transept-walls." Another instance of re-use was the casing of the choir in the 14th century. The remarks on the Perpendicular casing of the Norman choir have been made very intelligible to the general reader by the sketch given, showing the method of casing adopted by the 14th-century builder, and the way in which the circular Norman pillars were cut down in front, and the Perpendicular shafting introduced. When the Later work overtopped the Norman walls, these latter afforded the base for the Perpendicular buttresses which assist to carry the choir vaulting. The plan of the precincts shown in outline give the positions of the cloisters, the gateways, Roman wall, &c.; while the larger sketch-plan of the cathedral is sufficient to afford the visitor every particular. The addition of the sections indicating the relative levels of the nave and choir is also of value. It appears that the Norman mortar is yellow in colour, with only a small proportion of lime, and this imperfectly incorporated with the sand, and very friable, while the mortar of later periods is hard and good, and very white, as the lime has been well mixed. Of course, in every part, the Norman stone has been reworked and introduced into the masonry.

Referring to the chapter on "Chief Points of Interest," we find some interesting notes added about the south porch and its statues; the new granite font in the south aisle by Sir Gilbert Scott, executed by Farmer and Brindley; the new reredos, also erected from Sir Gilbert Scott's designs; the restored sedilia, &c. The description of the various painted windows forms another chapter, in which reference is made to the wall-paintings executed by Mr. Gambier Parry in his "spirit fresco," in 1866. Chapter V. describes the ancient paintings of the Last Judgment, discovered on the east wall of nave in 1718, and other remains in the vaulting, which are detailed by Mr. Waller. Notes on the old destroyed parts of the monastery have been added, which considerably enhance the value of the hand-book, and make it one of the most perfect we know of the kind.

THE SOUTH KENSINGTON DRAWING-BOOK.*

THE excellent series of drawing-books, issued under the sanction of the Committee of Council on Education, will be welcomed by all who are endeavouring to impart sound principles of instruction to art students, especially in our ordinary schools. For a long time schoolmasters have been left to their own resources to furnish suitable copies to their pupils, and we know what, as a rule, these copies generally are. Professor E. J. Poynter, R.A., the director for art, has, in the books we are noticing, selected progressive examples of some of the simpler and more popular class of subjects, chiefly taken from the Kensington Museum. The books on elementary freehand ornament consist of elementary forms common to ornament of all periods, though chiefly taken from a collection of Japanese design. Many of the former are of a purely geometrical character, beginning with simple squares and triangles, and other rectilinear figures, and proceeding to forms with curves, floral and other designs conventionalised. The two books published, if followed by the pupil, will give him a good insight into the composition of ornament in its simpler elements. The guiding outline and means of setting out by the eyes are indicated by faint dotted lines, and cannot fail to train the eye of the pupil to the delineation of curved and symmetrical figures.

The books on Freehand, first and second grade, contain examples selected from the Museum, and are arranged with considerable discrimination, so as to afford not only instruction but interest to the student. We have before us six books of the first grade, and we find that the subjects vary considerably in kind and degree of difficulty, so as to meet various tastes and capacities. Thus, in the first book, there is the simple outline of a sixteenth-century house, certainly not a very good model, but useful to train the eye in dimensions and proportions; next come heraldic shields, a Greek fret in the simplest form, a woven pattern intersecting Arabian patterns; in the second book are a few very excellent outlines of pottery, old English silver candlesticks, coffee-pots, Japanese fans, &c., each subject having its title given and the date. In the next book, the Eddystone lighthouse, varieties of ornament in outline, such as the fleur-de-lis, and some good outlines of Greek ornament and vases are given; these are followed by more decided varieties of architectural ornament, as the guilloche, the patera, the anthemion, acanthus foliage, Greek and Italian ornament. Some very elegant fictile forms appear in Part V., many of them taken from Greek, Chinese, and Italian examples; and domestic objects, furniture, &c., are given in Book VI.

A few instructions are appended to each book, in which it is advised that "measuring should not be resorted to unless to test the accuracy of the drawing after the copy has been made." The forms are intended to be lightly sketched in at first, after the centre or guiding lines are fixed, these being indicated in all the examples. We may add that not the least useful feature of these copybooks is that the examples are placed on the pages so that the pupil may copy them underneath, or on the next page, to a larger scale; the paper is a fine cartridge, well adapted for drawing on, and the examples are well printed. All the drawings have been made by pupils of the National Art Training School—a sufficient guarantee of the character of the copies.

* The South Kensington Drawing-Book; issued under the direction of E. J. POYNTER, R.A. London: Blackie and Son, publishers.

BOOKS RECEIVED.

Popular Lectures on Scientific Subjects, by H. Helmholtz, translated by E. Atkinson, Ph. D., &c. (London: Longmans and Co.) is one of the most useful books of its class we have ever seen. We especially direct attention to the 3rd lecture "On the Relation of Optics to Painting."——*Rules for Engine Drivers*, compiled by M. Powis Bale, M.I.M.E. (London: Wyman and Sons) is a handy, comprehensive, and accurate sheet of instructions, which should be hung in every room where an engine is at work.——*Engine Driving Life*, by Michael Reynolds (London: Lockwood and Co.), will be read by railway men and all desirous of knowing what the life of the engine-driver is. Some of the episodes are quite dramatic.——*A Descriptive Account of the Recently Discovered Villa near Brading, Isle of Wight*, by Cornelius Nicholson, F.G.S., F.S.A. (London: Elliot Stock), will be read with interest by all archæologists.——*Tuning and Repairing Pianofortes*, by Charles Babbington (London: The *Bazaar* office) seems a useful treatise, so far as we are able to judge.——*A Complete Course of Problems in Practical Plane Geometry, &c.* New and enlarged edition, by John William Palliser, late Second Master of Geometrical Drawing at the Leeds School of Art, &c. London: Simpkin, Marshall and Co. —A complete course of problems in plane geometry, intended for the use of students and others preparing for the examinations conducted by the Science and Art Department in the different grades, with an introduction to elementary solid geometry, has been brought out by Mr. John William Palliser, late second master and lecturer on geometrical drawing at the Leeds School of Art and Science The new and enlarged edition before us is published in a cheap form (price 2s.). The pages are bound as in a drawing-book, and each page, ruled into four columns, includes the diagrams and their solutions. This arrangement saves time to the learner and teacher, for the definitions and pro-

blems are well classified in sections, under particular heads. Thus we see right lines and figures, circles, measurement of angles, proportionals of lines, ellipses and curves, &c., separately treated. The diagrams, we find, from a general glance at the pages, are accurately engraved, and the working lines are shown, which is a great help to the beginner. A glossary of terms, and the elements of solid geometry, will be found useful, and the book very serviceable, by all artizans and students who may wish to have a complete text-book to assist them to prepare for the examinations in the first, second, and third grades. ——*Street's Indian and Colonial Mercantile Directory for* 1880-1 (London: G. Street and Co., 30, Cornhill, E.C., and Street Brothers, 5, Serle-street, 1880), in addition to the trade returns, tariffs, population, &c., contains full particulars (with rates and times of transit) of the steam and other communications with the various places treated of, wherever anything like a regular mode of conveyance or correspondence exists; and the average time of transit by sailing vessels is also given. The leading merchants and traders of every class, likely to be of any use to manufacturers and all engaged in commerce, are fully enumerated, together with the leading professional men—*e.g.*, physicians, surgeons, solicitors, &c. Concise descriptions of each country and town are furnished, with a view more particularly to show their commercial capabilities and peculiarities. The principal products, and details as to the articles of which the trade returns chiefly consist, will also be found; also tables of the local weights and measures, and the value in English money of foreign coins. The number of towns and cities has, we notice, again been increased. The new places include Montevideo, Winnipeg, Lagos, Aden, and several minor but not unimportant commercial towns. Maps are given of all the principal countries of which particulars are furnished in the letter-press. The work is certainly indispensable to every merchant, manufacturer, and exporter.——*Laxton's Price Book for* 1881. (London: Kelly and Co.), is issued for the sixty-fourth time, carefully revised and corrected, with much new matter added. We note especially a new section on p. 242, devoted to sanitary work; the work undoubtedly maintains its old position as the acknowledged standard to which in disputed cases in the various law-courts reference is made.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—An ordinary meeting was held on Tuesday evening week at the Rooms, Queen's College, under the presidency of Mr. R. B. Morgan, chairman of the association. After the business of the meeting, a paper on "Decoration" was read by Mr. W. H. Kendrick, of West Bromwich.

LIVERPOOL ARCHITECTURAL SOCIETY. — The fourth meeting of this society was held at the Royal Institution, Colquitt-street, Liverpool, on Wednesday evening, Jan. 12, the president, Charles Aldridge, F.R.I.B.A., being in the chair. After the usual routine business, the secretary announced that the sub-committee appointed to go into the merits of the measured drawings of the north vestibule of St. George's Hall, submitted by the students as recess work, had reported to the council that, in their opinion, those by R. Holt were the best, and those by C. R. Chidson, were second; they also highly commended the drawings sent in by J. H. Havelock Sutton. The council had approved of the award of the sub-committee, and the prizes would be given accordingly. The death of Mr. George Goodall, one of the oldest members, was announced, and a vote of condolence with his widow was passed. Mr. Samuel Huggins, also a very old member, who had sent in his resignation, owing to ill health, was elected an honorary member. Mr. J. W. Gibbs read a paper on "Domestic Sanitary Economy," illustrating it by means of large plans and sections, showing a thorough system of warming, ventilating, and draining on Boyle's system, and also by chemical experiments. A meeting of the students' class of design and construction was held, previously to the ordinary meeting, when a large number of designs for "a small stable" were handed in. Mr. Arthur P. Fry was the visitor for the evening.

SCHOOLS OF ART.

ROYAL ARCHITECTURAL MUSEUM.—The annual meeting of this school of art was held on Wednesday evening, Mr. J. P. Seddon occupying the chair, in the absence, through illness, of the president of council, the Right Hon. A. J. B. Beresford Hope, M.P. The chairman congratulated the students on the continued success of the School, both in numbers and in results at examinations. There were last session 92 members of evening-classes, 37 of the life class, and 12 of the ladies' class, making a total of 141 students. The numbers had gradually augmented, till it had become necessary to provide more accommodation. Alterations were consequently being made to the premises, by which a new antique room would be provided, and accommodation provided for an additional modelling-class. During the session the lease had been purchased at a cost of £500, so that the museum is now held directly from the Dean and Chapter of Westminster, with half-a-century to run, at £80 per year. He congratulated the students that, for three years successively, they had carried off one of the Plasterers' Company's prizes; the 2nd prize by Walter Allan in 1878, and the 1st prize in 1879 by Andrew Garbutt, and again in 1880 by William Kitson, who, like the prize-taker last year, had also been awarded a gold medal at South Kensington. The Chairman mentioned that the Council had been hampered by the smallness of their funds, and appealed for additional subscriptions. In connection with the museum sketching-club, the council offered a prize of five guineas, and the curator a second prize of two guineas, for sketches, in chronological order, of ornament illustrated by examples in the museum. He then distributed the prizes, including the Science and Art Department's gold medal and Plasterers' Company's 1st prize of £7 to William Kitson, for a modelled design of picture-frame in ceiling; Department's silver medal to F. K. Brown, and books instead of silver medals to W. G. Thomas and W. Catchpole; three national book prizes in the 3rd grade, and in the 2nd grade six book prizes and three certificates. In the museum sketching-club competition, J. Coates Carter took the prize, and T. Frederick Pennington and Walter Hammond received hon. mention. The Council's prizes were divided—James Smith and J. Treleaven æq. 1st, and R. A. Bell and Geo. Lawrence æq. 2nd. The chairman also spoke in terms of high commendation of a modelled capital, of 13th-century character, by Turner, and expressed surprise that a work so full of Mediæval feeling and expression, and without a redundant stroke or line, had not met with the approval of the Department examiners. Mr. Lomax, in proposing a vote of thanks to the chairman, said Mr. Seddon was one of the earliest supporters of the museum and school of art, having actively helped and advocated it since 1853; as its first secretary he expressed his pleasure that, after 30 years' struggling, it had become successful. A similar compliment was paid to Mr. Brown, head-master, and Mr. Druce, curator.

PARLIAMENTARY NOTES.

LIGHTING THE BRITISH MUSEUM.—Mr. D. Grant, on Monday, asked the right hon. the member for the University of Cambridge, as one of the trustees of the British Museum, whether any steps had been taken towards lighting the main portions of our great national collection, so as to allow it to remain open to the public until 10 o'clock at night every week-day throughout the year. Mr. Walpole was understood to say that the trustees had considered the subject of the hon. member's question; but that to carry out the hon. member's suggestion would involve great expense and a complete reorganisation of the staff.

THE TEMPLE BAR MEMORIAL.—On Tuesday notice was given by Mr. Labouchere on that day week to ask the Chief Commissioner of the Board of Works whether it is his intention to take steps to deal with an obstruction consisting of an heraldic beast, alleged by the Corporation of the City of London to be a griffin, and elevated above two statues professing to represent Her Majesty and the Prince of Wales, which has been erected opposite the New Law Courts in the centre of a public highway.

SUPPLY OF WATER TO LONDON.—In answer to Mr. Ritchie, Sir W. Harcourt said on Tuesday, that he hoped to be able to introduce a Bill on this subject this session.

COMPETITIONS.

FOREST HILL.—Plans have, during the past week, been submitted, in a limited competition, for the New Church of St. Paul, which is to be erected at Forest Hill.

HARROGATE CONSERVATIVE CLUB AND PUBLIC COFFEE-HOUSE COMPETITION.—In a limited competition of six *Conservative* architects practising in Harrogate, the awards have been made as follows: viz., First premium, to Mr. A. Hiscoe, East Parade, Harrogate; second premium, to Mr. R. Dyson, 10, Parliament-street, Harrogate; and third premium, to Messrs. Perkin and Bulmer, Park-row, Leeds, and Harrogate. It was suggested to the directors that a professional referee should be asked to adjudicate upon the designs, but the directors considered themselves equal to the task of awarding the premiums.

PONTEFRACT TOWN HALL SCHEME.—The Corporation of this borough held another specially summoned meeting, on Tuesday evening, to consider a requisition signed by ten members, to take immediate steps in the rebuilding of the town hall, &c. The majority at the last division, when the scheme was thrown over, now proposed that the old hall should be cleared away and important street-improvements should be carried out. This was met by an amendment, that the corporation should be empowered to spend £7,000 in the erection of a new assembly-room, with surveyor's offices, and additional police-cell accommodation, to include the purchase of additional properties—the old vicarage and dispensary—and the architect's commission. The amendment was carried by 11 to 10 votes, so that virtually the original scheme will now be carried out. The £3,000 subscribed by the public will be devoted to the purchase of the old property, and the £7,000 to the building. Only a portion of the dispensary, for which the corporation has paid nearly £1,500, will now be required, and the other portion will consequently be for resale. The assembly-room it is proposed to slightly curtail in size, and also to adopt the plans of "Straight and True," with some modifications; the main front will be of brick instead of stone. It was decided to award the premiums to the two sets of plans selected as best, and to return the remainder to the competitors.

CHIPS.

The church of St. Cuthbert, at Pond, near Newcastle-on-Tyne, was recently opened. It has been erected from the plans, and under the supervision of Mr. A. R. Gibson, of Newcastle, and the fittings, including altar-rail and standards, brass gaselier and gas-brackets, were supplied by Messrs. Jones and Willis, of Temple-row, Birmingham, and Euston-road, London.

Mr. Baldwin Latham, C.E., has written to the Croydon local board of health, and also to the local newspapers, complaining that after he had entered upon, and been successful in, a limited competition for the drainage of South Norwood, another committee of the local board had advised the board to adopt a scheme by Mr. P. Walker, of which proposal Mr. Latham says, "the authorship was exclusively and solely my own," made in 1878, when a member of the local board. By the conditions of competition, £20 was proposed to be paid to each of the five engineers invited, a premium which, Mr. Latham says, was insufficient to cover the cost of surveying the district, and it was added, "the committee will not bind themselves to accept any scheme which may be offered, but in the event of the approval of either scheme as suitable for their requirements the commmittee will most probably recommend its adoption by the board."

The town council of Dover adopted on Tuesday a report and plans prepared by the borough surveyor, for the improvement of the waterworks, and decided to invite tenders from a few selected firms. The estimated cost is £7,000.

The Hackney board of guardians again discussed last week the question of employing Messrs. Lee and Smith, of Queen Victoria-street, E.C., as architects in preparing plans of the new workhouse. At a previous meeting it was stated that that firm had had a claim on the guardians for £2,000, and the clerk was directed to inquire into the truth of the assertion. In reply, Messrs. Lee and Smith wrote that they had a claim for preparing plans that had not been used; but in consideration of the kindness of the board to them, they would waive it. Some surprise was expressed by members, but it was eventually resolved to instruct Messrs. Lee and Smith to prepare block-plans for a new wing, for 300 persons, to the workhouse.

ILLUSTRATIONS.

ALTAR AND REREDOS, ST. MARTIN'S CHURCH, BRIGHTON.—CHISWICK SCHOOL OF ART.—OFFICES AT BRADFORD.—DESIGNS FOR AN ARTIST'S STUDIO AND RESIDENCE.—SKETCHES FROM MELROSE ABBEY.

OUR LITHOGRAPHIC ILLUSTRATIONS.

REREDOS AT ST. MARTIN'S CHURCH, BRIGHTON.

THE unusual dimensions of this reredos arose from the fact that it was the desire of Mr. Arthur Wagner, who, with his two brothers, founded the church, that the east window should be kept as high as possible, in order that space might be left for an elaborate work below, such as we so frequently find in the churches in Spain. We have, however, in our own country four or five great reredoses still remaining—those at Winchester, St. Alban's, St. Saviour's, Southwark, Christchurch Priory, and in an Oxford College, and these have been followed rather than foreign examples. The total width of the chancel is 40ft. in the clear, and the height to the window is about the same. The whole is constructed of wood, and the main portion is divided by towers into three divisions. At the foot of the centre division stands the altar, 12ft. long, and above it is a series of canopied niches, with figures of the Apostles and our Lord in the centre. Above there is a slightly overhanging cove surmounted by an open carved cresting. The towers on either side contain niches. On the right we find five figures, St. Nicholas, St. Barnabas, St. Stephen, Lazarus, and St. Ann. On the left, St. Martin, St. Paul, St. Alban, St. John Baptist, and St. Elizabeth. On either side of the centre picture in the upper range are fine small niches, with figures of angels playing on various instruments. The large flanking towers, which are hexagonal on plan, display two ranges of niches towards the spectator. The tower on the right containing figures of Seth and Enoch, Noah and Job, Miriam and Moses, Melchisedec and Abraham, Isaac and Joseph, Joshua and Jonah, Hannah and Samuel, David and Isaiah, Daniel and Ezekiel. The tower on the left contains figures of St. Athanasius and St. Basil, St. Gregory Nazienzen and St. John Chrysostom, St. Polycarp and St. Clement, St. Lawrence and St. Ignatius, St. Boniface and St. Augustine of Canterbury, St. Richard of Chichester and St. Wilfred, St. Elphege and St. Anselm, St. Chad and St. Edward the Confessor, St. Dunstan and the Venerable Bede. The paintings are in a double range. In the upper row of compartments the subjects are as follows: Centre, the figure of Christ the Conqueror, triumphant in expression and crowned; below him stand St. John and the Blessed Virgin, on the left are St. Mary Magdalene and Mary the wife of Cleophas, and on the right the Good Centurion and the Penitent Thief. Then in the first panel to the left, we have St. Mark and St. Matthew, in the next and outermost, St. Luke and St. John, and behind, St. Paul with Phœbe and Priscilla. The first panel on the right of the centre contains Adam and Abel, the next Abraham, Moses, Elijah, Isaiah, and Ezekiel. The centre panel of the lower row is occupied by the Nativity with St. Joseph and St. Anna, the Infant St. John, and one of the Holy Innocents. The three kings are in the act of adoration. The panels on the right of this are devoted to the chief personages of the Old Dispensation not represented in the upper row; 1st. Judges: Joshua, Gideon, Deborah; 2nd. Priests: Samuel, Aaron, Eleazar; 3rd. Kings: David, Hezekiah, Josiah; 4th and 5th, Minor Prophets. On the left are found personages notable in the history of the Church. 1st. The Fathers: SS. Jerome, Gregory, and Ambrose. 2nd. The monastic orders: St. Francis of Assisi, St. Thomas Aquinas. 3rd. Royal Persons: St. Elizabeth of Hungary, St. Margaret of Scotland, St. Louis of France, King Charles I. In the fifth panel we come to modern times, the object being to set forth the missionary character more particularly of the Church of England, in the persons of the first bishops of her five daughter churches. In the sixth are represented modern worthies of the Church. These two panels have, in the drawing from which this illustration is made, been transposed by mistake. The small compartment, on the wings closing the lower range left and right, contains the champions of truth against Paganism: St. George, St. David, St. Andrew, St. Patrick, Judas Maccabæus, Judith, and the Three Children. These paintings were all executed by Mr. H. Ellis Wooldridge. The major part of the woodwork of the reredos is gilt. The walls surrounding it are to be diapered with tones of green; but at present the work suffers much from this very necessary part of the design not having been completed. The figures were carved at Ober Ammergau, many of them by Joseph Mayr, of whom we have lately heard so often. The reredos was carved and constructed by Mr. J. E. Knox, of Doris-street, Kennington Cross, who has just completed the pulpit and canopy, of which we hope shortly to give an illustration. The work was designed by Mr. Somers Clarke, jun., F.S.A., 6, Delahay-street, S.W., who was also the architect of the church.

CHISWICK SCHOOL OF ART, BEDFORD PARK.

THE new School of Art, now in course of erection at Bedford-park, is situated on a commanding site, having a frontage of about 90ft. in the Bath-road, almost adjoining the Bedford-park stores and church. To-day we have reproduced the plans and front elevation of the portion now being built. Larger class-rooms are proposed for erection at the rear of the present structure, and extending to the frontage secured to the site by the roadway at the back of the premises. The purposes for which the several studios are intended will be found written on the plans. The office of the care-taker commands the entrance on all sides, and the hall and staircase are arranged with a view, not only for present requirements, but for their ultimate uses when the future extension is completed. The stairs are 5ft. wide, and have teak treads. A heating-chamber is provided under the gentlemen's lavatory, and hot-water pipes will warm the entire building, excepting the master's room, where an open fireplace is to be used. The style chosen for the school is in harmony with the houses and other public buildings erected on the estate, though rather a later type of old English building, has, perhaps, been taken as a suggestion for the elevations. To secure harmony with the surrounding buildings, which are from Mr. Norman Shaw's designs, the plans for the new school of art were submitted to Mr. Shaw, and received his approval before the work was commenced. The entire building is being built in red brick, with cut-brick archways, pediments, strings, and copings, the sills and upper surfaces being covered with lead. The roof is to be covered with green slates, and the windows throughout are to be glazed with clear glass, in square quarries, larger in size really than the scale of those shown in our present elevation. The architect from whose designs, and under whose superintendence, the school is erecting is Mr. Maurice B. Adams, A.R.I.B.A. Mr. E. S. Burchett, of South Kensington Museum, is to be the head-master, in conjunction with Mr. F. Hamilton Jackson, of Bedford-park, and late of the Slade schools. The Duke of Devonshire is the president, and among the vice-presidents are Lord George Hamilton, M.P., the Marquis of Bute, Leopold Rothschild, Esq., and the Right Honourable A. J. B. Beresford Hope, M.P.

OFFICES IN SUNBRIDGE-ROAD, BRADFORD.

THESE buildings, now approaching completion, have been erected next the public stairway connecting Sunbridge-road with Miller-Gate, a position which has been taken advantage of to secure side-lighting, and also to acquire two lower stories between the different levels of the two streets, available for warehousing. The principle façade is to Sunbridge-road, a new thoroughfare, which, in course of time, must become one of the main arteries of the town. The style adopted is a free treatment of the Queen Anne period, a style not hitherto introduced into any of the buildings of the town. The main fronts are built in cleansed ashlar of uniform colour, from the quarries of the neighbourhood, Messrs. Waugh and Isitt are the architects, and the work has been carried out by local contractors.

"BUILDING NEWS" DESIGNING CLUB.—AN ARTIST'S HOME.

A RESIDENCE, with studio, for an artist was the first subject chosen for competition in this series of designs by members of our club, and already we have published the selected design.* To-day we have lithographed "Cui Bono's" design, to which the second place in the competition was awarded. In this plan the studio is on the ground-floor, which, for suburban sites at any rate, presents a difficulty not easily overcome if adjoining houses are to be erected, because the light would in that case be seriously interfered with. Trees, also, if near the studio-windows, as in "Cui Bono's" sketch, would also be much objected to by the painter. When the studio is placed on the first floor, both these difficulties are mostly to be overcome. The general arrangement of the house now illustrated is not good, as we have already pointed out. To enter the studio the staircase has to be passed under, and the way to the kitchen is far from admirable. The architectural treatment of this design has much to commend it.

MELROSE ABBEY.

MELROSE ABBEY, which the genius of Sir Walter Scott has rendered the most celebrated of Scottish monastic buildings, owed its foundation to the munificence of King David I., who, from his attachment to the Church and the frequent liberality of his endowments, is reputed to have been "a sore saint to the Crown." The original building was erected during the decade ending 1146, but of this no trace now remains. It was too near the borders of England to escape during the disputes with that kingdom. The neighbourhood was the repeated scene of warfare between the contending hosts who were

> "Keeping the rights of the border side,
> Warden to warden, and man to man."

Edward II. destroyed it during his retreat in 1322. It was restored by the liberality of King Robert the Bruce; given to the flames by the army of Richard II. in 1385, and sustained repeated injuries from other inroads. It was tenanted by the Cistercian monks who, whatever may have been the original severity of their order, appear ultimately to have gained the reputation of being anything but ascetics, for

> "The monks of Melrose made good kale
> On Fridays when they fasted,
> And wanted neither beef nor ale
> So long 's their neighbours' lasted."

The abbey was rendered uninhabitable during the destroying zeal of the Reformation, and the building seems subsequently to have been looked upon as a quarry for the erection of private and public buildings, and the repair of mills and sluices. In the early part of the 17th century the nave was fitted up, and for some time used as a parish-church, and a vault, which still remains, thrown over it with the stones of the old building. The ruins are now carefully preserved and placed under charge of a keeper. There are several different designs shown in the clerestory openings, of which two are shown in our illustration. Their capitals, together with the pateras and boss, are excellent specimens of the characteristic carving of the building.—W. C.

OBLIQUE BRIDGES.*

A NEW edition of Mr. Buck's well-known treatise on Oblique Bridges has just been brought out, in which we find that the original essay has been thoroughly revised by his son, Mr. J. H. Watson Buck, and several inaccuracies which had crept into the plates and letter-press have been corrected. In the present edition also, a simplification of the analysis of the developments for obtaining the dimensions of the twisting rules has been attempted; in other respects, the book does not materially differ in appearance from the old edition. The subject is well illustrated. No less than 12 plates of diagrams accompany the descriptions, leading the student from the elementary principles to the method of construction. The oblique arch is not a modern invention, as some have imagined. In Italy, the art of oblique bridge construction appears from Vasari to have been known as early as 1530, when Nicola, called Il Tribolo, erected a bridge over the river Mugnone, near Porta Sangallo at Florence, on the main road to Bologna. Few writers on the subject have investigated the principles of the art in this country before Nicholson, who was the first to elucidate the subject, and to explain the method of constructing skew arches with spiral courses. Mr. Buck's treatise is, however, recognised as a standard text-book; and the author's treatment has divested the subject of many of the intricacies supposed to belong to it. The first chapter contains a concise geometrical exposition of the subject, from which the student will obtain a correct idea of the elements of the oblique arch. The development of the surface of an oblique section of a cylinder lies at the root of the oblique arch, and the explanations given of the diagrams on plate 3 are sufficient to convey the principles to the student and to remove any preliminary difficulty. At the same time, any one who attempts to make working-drawings of the joints in the development of the extrados, or the elevation of the face of an oblique arch, will find the projection of lines tedious and troublesome, and any great degree of accuracy will be impossible. To facilitate the construction of bridges of this kind, it becomes necessary, therefore, to resort to computation. Mr. Buck enters into the investigation of the formulæ for determining the dimensions and angles, and shows that the means of determining the point at which the joints of the arch face meet, also lend other valuable aid. Of course, trigonometrical knowledge is required in working out the formulæ. In another chapter, the method of working the voussoirs, or the winding beds of the voussoirs, obtained by the use of the "twisting rule," is described, and the manner of finding the dimensions of the two rules employed by the mason or bricklayer given. But the most useful part of the treatise is devoted to practical examples of the application of the formulæ. The numerical values attached are those suited to actual bridges, and the first example given illustrates the case of a bridge of 33ft. span, of semicircular form, to carry a railway over a road at an angle of 50°. The results are tabulated, and the author shows how they are to be applied in the construction of the twisting rules, and templates for the workmen. The mode of erection is the subject of another chapter; after which, some useful rules follow for the making of moulds for drawing oblique bridges; these are cut out of thin wood or cardboard. Some valuable observations are made in the concluding chapter, on the extent or degree of obliquity, to which it is safe to construct an oblique arch, and the calculations made lead the author to the conclusion that an angle of 25°, "is the natural limit of obliquity to which an arch can, with scientific propriety, be constructed, when composed of an entire semicircle on the direct or square span." The angle of 45° has been considered as the greatest degree of obliquity at which it is safe to construct an arch; but, as the author observes, such an opinion has been formed from the practical difficulty found of making semicircular arches safe at that angle, and because this difficulty increases from 90 to 45 degrees, it has been assumed to increase from the latter, downwards; whereas, the contrary is the case. The work is confined to oblique arches, which are cylindrical upon their right section; those with elliptical direct sections are not considered, as the author just considers them deficient in stability! Mr. W. H. Barlow's description and diagrams for facilitating construction, are valuable auxiliaries in saving computation, and add greatly to the practical value of Mr. Buck's labours. As a guide to the engineer and architect on a confessedly difficult subject, Mr. Buck's work is unsurpasseed.

* A Practical and Theoretical Essay on Oblique Bridges. By GEORGE WATSON BUCK, M. Inst C.E. Third edition. Revised by his son, J. H. WATSON BUCK, M. Inst. C.E. London: Crosby Lockwood and Co.

Building Intelligence.

BATH AND WELLS DIOCESAN SOCIETIES.—The quarterly meeting of these societies was held at Wells on Tuesday week, when the following grants were made:—St. Lawrence Church, Priddy, for extensive repairs and restoration, £100; to St. Lawrence Church, West Harptree, for extensive repairs and re-roofing, £100; new mission church in the parish of St. John, Bridgwater, £100; to St. Mary's Church, Norton-sub-Hamdon, towards restoration, £10; to St. Michael's Church, Timberscombe, towards restoration £10; to school at Wellow, near Bath, £10 towards new class-room. The report of a sub-committee was read as to the appointment of honorary architect in succession to the late Mr. Benjamin Ferrey, F.S.A. Out of 17 candidates Messrs. E. B. Ferrey and J. D. Sedding, both of London, had been selected. On being put to the vote, Mr. Sedding was elected.

ELTHAM.—The opening services of the Bible Christian Chapel, Eltham, took place on the 13th inst. The building is Gothic. The front is faced with red bricks, and has a large five-light window filled with tinted glass, the tympanum being filled with diagonal bricks and terra-cotta tiles. The sides are in best stock bricks with red bands and arches; the building being covered with Broomhall tiles. The open benches are in pitch-pine, and the rostrum (part ornamental) is of the same material, but polished. The whole of the roof-timbers are exposed, together with the work, and varnished, the principals and purlins being stained. The whole of the works have been well executed by Messrs. Watts and Davies, builders, of Foot's Cray, Kent, from designs and under the superintendence of the architect, Mr. Wm. Theobalds, London.

SALISBURY DIOCESAN CHURCH BUILDING ASSOCIATION.—The first quarterly meeting of this association for the present year was held on the 4th inst. There were only two cases which could be dealt with. The first was an application for a grant towards the restoration of the parish-church of Tidcombe, in the archdeaconry of Wilts, which is in such a dilapidated condition as to require re-building. The proposed works are estimated to cost £700, of which £300 has already been provided, and an increase of accommodation to the extent of twenty-two additional sitttngs being secured, a grant of £60 was made. The other case was from the tything of Chicksgrove, in the parish of Tisbury, in the archdeaconry of Sarum, a grant being required towards enlarging the existing school-chapel there, by adding to it a chancel, which will give seventy additional sittings; the proposed works to cost about £300. A grant in aid of £25 was made.

STAMFORD.—The new banking premises at Stamford, for the Northamptonshire Banking Company, have been in progress during the last 18 months, and were occupied for the first time on the 22nd ult. They are situated in High-street. In them is contained all the accommodation required for an extensive banking business, including a residence for the manager. The main front, of Portland and Bath stone, rises to a height of 50ft. above the pavement, and is designed in the English Renaissance style. It is divided into four bays, the two side ones of which project slightly from the main line and contain the entrances to the bank and manager's house. The banking-room is lighted by two large windows in the main front. The fittings, consisting of desks, vestibule, wainscoting, doors, &c., are of American walnut, with mahogany panels and oak mouldings, all from special designs of the architect, as is also the chimney-piece, consisting of a marble mantel, with walnut, &c., overmantel, containing a clock. The wall above the wainscoting, and the panelled ceiling, have been decorated in colour. The space allotted to customers is laid with marble mosaic, by Messrs. Burke and Co., of London. The manager's and strong-rooms are situated at the back of the banking-room, into which they open; there is an extra strong-room for plate, valuables, &c., in the basement. The manager's residence has dining and drawing rooms, kitchen, pantry, and the necessary domestic offices, several bedrooms and a bathrom on the first and second floors, approached by a staircase in pitch-pine and mahogany, with a separate staircase for servants. The whole of the works have been most efficiently carried out by Messrs. Roberts Bros., of Stamford. The architect is Mr. W. Talbot Brown, A.R.I.B.A., The Square, Wellingborough.

STONYHURST COLLEGE.—The college of the Jesuits at Stonyhurst is being further enlarged. Two years ago a new wing was erected at the north end, and now a new wing on the south end is nearly finished, and other important additions have yet to be made before the scheme of enlargement is complete. Some idea of the scale upon which the new part is designed may be gleaned from the fact that the academy-room is 98ft. long and 50ft. wide. The ceiling in this room will be one of the richest examples executed in modern times. The style is Jacobean, and the modelling is founded on the type of those famous ceilings at Aston Hall; but in addition to this a deep plaster frieze, composed of shields, animals, fruit, flowers, and arabesques, will be carried along three sides of the chamber. It is computed that the total expenditure upon the proposed additions will be a little over £120,000—that is, exclusive of the stone, which is quarried upon the college estate. The architects engaged are Messrs. Dunn and Hansom, of Westminster, and the whole of the sculptured details and modelling are entrused to Mr. Roddis, of Aston. The contractor for the building is Mr. Thos. Craven, of Blackburn.

WYNARD'S ALMSHOUSES, EXETER.—This rather interesting block of old buildings, standing just without the site of the city's ancient south gate, has been restored. They were built by William Wynard, the third recorder of Exeter, in 1436, but some of the original buildings were destroyed during the sieges in the civil wars in the 17th century. The group consists of a chapel, and houses for 12 indigent men, built in a square with an open courtyard in the midst. The buildings, having become somewhat ruinous, have just been carefully restored under Mr. Edward Ashworth, architect, of Exeter. The north front of the quadrangle has been nearly all reconstructed in Heavitree stone, and the chimney-shafts of the dwellings are rebuilt in brick and Bath stone. The walls have been raised 18in., thus giving additional comfort in the heretofore low-ceilinged bedrooms. The roofs of the north, east, and west sides of the quadrangle have been reconstructed of new timber. The coating of roughcast has been beaten off the fronts of the houses, and the facing of Heavitree stone repaired and made in conformity with the chapel. The bell-turret and the labels and string-courses have been made good where need be. The woodwork was done by Mr. Vicary, the masonry by Mr. R. Mitchell, the carving by Mr. Harry Hems, and the painting and glazing by Messrs. Kingwell and Son; all these tradesmen being of Exeter.

At the West Sussex Quarter Sessions, held on Thursday week, a report was received from the highways committee as to the appointment and duties of a surveyor for the division. The report stated that there were four duties falling upon the surveyor as an officer: those of inspecting every county bridge, and to report on its state; to inspect and report on other bridges when called upon to do so; to inspect police-stations and other county buildings; and to inspect the main roads at least four times in every year. It was recommended that the duties required for bridges and county buildings should be separated from those relating to roads, and that the two offices be discharged by different persons—the one to be a member of the Institution of Civil Engineers, and to be called the county-surveyor; the other to be a competent county road-surveyor. The pay of the former should be an annual retaining-fee of 50 guineas, with 1½ guineas for each attendance to inspect bridges and buildings, and 5 per cent. commission on all contracts above £20; commission to include plans and specifications. The county-road surveyor should be paid £100 a year, including travelling and all expenses.

More than Fifty Thousand Replies and Letters on subjects of Universal Interest have appeared during the last ten years in the ENGLISH MECHANIC AND WORLD OF SCIENCE, most of them from the pens of the leading Scientific and Technical Authorities of the day. Thousands of original articles and scientific papers, and countless receipts and wrinkles embracing almost every subject on which it is possible to desire information have also appeared during the same period The earliest and most accurate information respecting all new scientific discoveries and mechanical inventions is to be found in its pages, and its large circulation render its the best medium for all advertisers who wish their announcements to be brought under the notice of manufacturers, mechanics, scientific workers, and amateurs. Price Twopence, of all booksellers and newsvendors. Post free 2½d. Office: 31, Tavistock street, Covent-garden W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.
(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. R. M. TUTTLE, of 13 and 15, Laight-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Cases for binding the half-yearly volumes, 2s. each.

Handsomely bound in cloth, Vol. XXXVIII. of the BUILDING NEWS. Price Twelve Shillings. Order at once, as only a limited number are bound up.

N.B.—Cases and vols. must be ordered through a bookseller or newsagent, as the regulations of the Post-office prevent them from being sent by post.

Correspondence.

SANITARY PROTECTION ASSOCIATIONS.

To the Editor of the BUILDING NEWS.

SIR,—Judging from the evidence now available, it is undeniable that room exists for the formation of a sanitary protection association, based upon sound principles, for the metropolis, where, if we may rely upon one statement made during the discussion on Professor Jenkin's paper at the Society of Arts, 50,000 new houses, unfit for habitation, are annually added to the enormous number believed to exist already within its limits. Although the discussion does not appear to have been upon any very extensive scale, one or two remarks were offered in criticism of the proposal, which many will be unable to regard as having been satisfactorily disposed of by the author of the paper in his reply, and on which it might be well to elicit the opinions of outsiders to whom the subject of house-sanitation is familiar.

Mr. Cresswell, in expressing his disappointment at the insignificant proportions of the association's operations, doubtless had his own more extended scheme of sanitary assurance in view, and it may, indeed, fairly be urged that if domestic sanitary inspection be necessary at all, it is a subject with which nothing short of compulsion and universal application can effectually deal. A purely voluntary association, such as that advocated in the paper under review, will obviously fail to bring within its scope that large class of anything but sanitary property which owes its origin to speculative building, a circumstance which, while it may not affect the value of the association to its actual members, clearly detracts from its efficiency as a means of improving the sanitary condition of London as a whole. It is evident, therefore, that the largest possible measure of success which may attend the new association will not imply more than the merest nibbling at the fringe of the domestic insalubrity known to abound in the metropolis.

This much being premised, it will be well to consider, in greater detail than the promoters seem to have devoted to the question, how far the objects of the association are likely to be attained, even for its members, by the proposed system of inspection. In this matter the objection raised by Mr. Rogers Field may be said to be well-nigh fatal to the practical success of the scheme. Mr. Field's experience in house-drainage, both in and out of London, is almost unique, and certainly entitles him to be heard on such a point as the amount of time required for the perfect examination of a house previous to the preparation of a report on its sanitary condition. He evidently considers the terms of the association too low to secure proper attention to this very important preliminary, and is supported in this respect by Mr. Collins, who regards the matter from a thoroughly practical point of view, especially in condemning the idea that a young and inexperienced man can be trusted to deal with this question under the merely nominal supervision of a consulting engineer, no matter how eminent the latter may be. Professor Jenkin, it is true, partially anticipated this objection in the body of his paper by arguing that the resident engineer of the parent association in Edinburgh "is paid at the rate common for men of his standing," and that "the consulting engineer receives a fee which, *having regard to the call on his time*, is remunerative." Now, our examination of the figures in the Edinburgh association's balance-sheet for the second year, as appended to the paper, shows that a salary rising from £150 to £170 per annum has there been paid to the resident engineer, and that the annual remuneration of the consulting engineer (Prof. Jenkin himself) is £52 10s. The association has been in existence not quite three years, during which time 1,200 houses are stated to have been improved, the total cost of Professor Jenkin's services being thus £157 10s. at most, an amount which, divided by 1,200, yields the munificent average of 2s. 7½d. per house, as the remuneration of the consulting engineer, by whom, as he himself states, this amount is considered "remunerative." The explanation of this seeming paradox may possibly be that in the large majority of cases the projected alterations are never brought under the notice of the consulting engineer at all, but effected upon the sole responsibility of the resident and subordinate official. But if this be so, the fact assuredly militates against the fundamental idea of the association, by which the aid of co-operation is invoked in order to secure eminent and authoritative advice in contradistinction to the counsels of second-rate and inexperienced persons. Pursuing the financial question still further, and taking the salary of the Edinburgh resident engineer at £150 per annum for the first two years, and £170 for the third, it will be seen that a total of £470 for the three years is to be considered under this head, which, treated as before, yields an average of 7s. 10d. per house for the 1,200 which have been improved. Making every allowance for the benefits of co-operation and the extolled absence of pecuniary gain for the association, it is simply impossible that sums such as these can be considered sufficient to secure the requisite amount of engineering supervision over works under execution, especially when the peculiarly detailed nature of house-drainage work is considered. On this point I would just draw attention to a flaw in the argument advanced by Mr. Robins, who quotes a case in which certain recommendations of the Edinburgh Association were carried out at St. Andrew's by local workmen, and *afterwards inspected*, presumably by the officers of the association. No one with any knowledge of the subject would wish to depreciate the advantages, and even the necessity, of good design in work of this class; but it would be idle at the same time to ignore the fact that faultless execution is just as much to be kept in view, and this it has over and over again been found impossible to secure by any so-caled system of final inspection, or, in fact, by anything less than the most minute and skilled supervision over such items as pipe-laying and jointing, and the setting of traps and other fittings. No adequate inspection of such work, can, by any possibility, be performed by one man who, as stated with regard to Edinburgh, has been expected to visit 450 or 500 houses per annum, in most of which, as the figures show, structural alterations have been in progress at the time referred to.

There is one other objection which, it seems, has already been raised against the formation of the London Association—that of unfair competition with professional men as sanitary advisers. This, while Professor Jenkin alludes to it in his paper, he takes no pains to meet in any effective way, although it will probably be admitted that the figures already quoted constitute a remarkable confirmation of the charge. An association which tacitly claims to be in a position to supply the engineering advice and control requisite for the sanitary improvement of a house for an average sum of 10s. 5½d. can hardly be said to leave much scope for remunerative charges by professional men for their evidently more deliberate and exhaustive treatment of a residence. Neither can it be held that the Edinburgh Association, in undertaking to advise in sanitary matters beyond the limits of that city, has been careful to avoid a similar charge of interference with professional interests. The same report from which Professor Jenkins has extracted the balance-sheet to illustrate his paper, contains the names of several public and private establishments in various parts of Scotland in regard to which the advice of the association's officials has been obtained, and there is even one case named in the report in which an *English* infirmary was favoured in the same way. Under these circumstances, it would have been but fair to waive all claims of commercial disinterestedness on the part of the Edinburgh Association at least, and to state, also, whether the London Association proposed to extend its operations in a similarly objectionable manner. There is an essential difference between a mutual protection society and a huge trading association, and it can hardly be expected that those who would favour the one would necessarily be inclined to further the aims of the other. This must especially be the case when, as has been shown, defects in principle exist in the organisation, from which either the work or the members must eventually suffer.—I am, &c.,

JOHN S. HODGSON.

Hexham, Jan. 17, 1881.

SHEFFIELD FONT COMPETITION.

SIR,—In reply to "A Last Resource," I can state that the *premium* and *work* for the above have been given to a "local modeller" for a *semi-Classic design*, introducing *stone* and *bronze*.

The principal architectural firms in Sheffield refused to compete, for reasons given in your paper by a former correspondent.—I am, &c.,

NOT A COMPETITOR.

SIR,—I, too, was a competitor in the Sheffield Font Competition. My drawings were duly returned, carriage paid; but, unlike "A Last Resource," I was informed that the execution of the font was given to a sculptor of Leeds (I think), and the £5 premium to a gentleman of Sheffield.—I am, &c.,

HENRY TERRY.

34, Crawshay-road, North Brixton.

MODERN DOMESTIC ARCHITECTURE.

SIR,—Some seven years have elapsed since the cry went forth that Queen Anne should reign, and that all noble Goths should be felled to the ground. That cry has, in great measure, been fulfilled; but have we much cause to be proud of the result? When one thinks of some of the work which was being palmed off on the world as Gothic, he need not wonder that a change was welcomed. But now, having given our "lady help" a fair trial, we may well ponder on the past, and ask ourselves whether we should not be wise in letting the venerable Goth have another opportunity of redeeming his character; for was he not the very best of servants for ages before Queen Anne was born, and also after her death; therefore, do not let an upstart with a fictitious name have it all her own way.

A well-known architect once made the absurd remark that we could not have Gothic without pointed arches; but, as the same man has since written a book in which there is so much in praise of my old friend (notwithstanding his evident desire to tread him underfoot), I forgive him.

I trust that no one will jump to the conclusion that I have no sympathy with the so-called Queen Anne revival or mania, for such is not the case, and my belief is that it has done us a vast amount of good; but whilst we appreciate its many successes, we cannot but deplore its numerous failures; and I am convinced that we are losing much by trying to ignore a style which has served us so well in the past, and which is capable of doing so again in the future. My strong conviction is that it depends much more upon the man than the *style*, as to whether a fabric is pleasing or the reverse, and I am of opinion that there is no style of architecture in existence out of which a clever man would not be sure to produce something interesting.

Skill and common-sense will work wonders, and a Gothic house in good hands would be no more costly, and could be made equal in every respect to the very best in the Queen Anne style which ever has or will be built.

Some prejudiced people will doubtless say: Show us some good Modern Domestic Gothic. True, it is more rare than it should be; but if any one will go to Burleigh-street, Strand, he will find there a little house, designed by Mr. Butterfield, and erected about 15 or 20 years ago, well worth the visit; from there, let him go to those Queen Anne Mansions at the back of Sloane-street, and in their midst, at the corner of a square, he will find a charming Gothic house designed by Mr. Street (without small panes dotted all over its front, like some of its neighbours) thoroughly domestic and thoroughly modern. I know of only few successfully treated modern stone-mullioned windows; but the Gothic part of a house on Campden-hill, designed by Mr. Norman Shaw, is well worth study for this kind of fenestration; and the other day I came across a truly delightful example glazed with plate glass near the Castle Bar Estate, Ealing. Gothic windows generally look well with large-sized sheets of glass, but Queen Anne windows do not; and, as a proof that this fashionable style owes its popularity in a great measure to the colour of the materials used, and its small panes with thick white sash bars; I cannot do better than draw attention to the unsightly appearance of a dormer in cement, and a window minus its white bars, in a block of buildings on the Chelsea Embankment. Mr. Waterhouse's Red Gothic in Holborn may be studied as a successful link between what is purely domestic and ecclesiastical. Trusting that these musings will, to some extent, be the means of arousing those giants of the pen, and others who, for a time, battled with the insidious tempter, but who now seem to be revelling in her fascinating arms.—I am, &c.,

W. GALSWORTHY DAVIE.

5, Pembroke-gardens, Kensington.

HOTEL DE VILLE, BRUSSELS.

SIR,—In your issue of Dec. 24, 1880, there appeared a view of the Grand Place, Brussels, taken from a drawing by M. Brandling.

No doubt the picture would be "telling," on account of the subject, and it is extremely interesting to anyone who has been in Brussels.

But will you allow me, sir, to point out some of the discrepancies which appear between the plate and a photograph which I got in Brussels some six or eight years ago. I shall only mention some of the most obvious differences in the matter of detail, and can assure you the drawing is quite unreliable.

To begin with, the photo. shows five double bays between the nearest (south, I expect) turret and the tower, each bay having two arches in same, i.e., ten arches and windows over; the double bays are separated by stronger piers and double statues. A sort of niche apparently is formed in the parapet to finish the pier between bays. All this is ignored in the drawing.

At the other side of tower the arrangement *really* is quite different from what it is on the south side; but the drawing shows the same, and also two or three windows in excess. The parapet here ought to be quite different to what it is on south side.

The ground-floor arches in south turret at angle and in tower are very different to what is shown by photo.

According to photo, in order to make way for some entrance steps, two pillars carrying arches on south side of tower are omitted, and the arches apparently carried by a mere pendant.

From the drawing one could not gather that there is a beautiful series of statues between first and second floors, as well as others on the piers between the windows.

The photo. shows a clock, apparently, on the turret at south-east angle; the drawing a large one on tower.

The tower itself is anything but correct. The large pinnacles are shown connected by cusped arches in photo., and that which is corbelled out over the ridge looks graceful, whilst in drawing it is most awkward. Indeed, the corbelling out of the first parapet to tower is anything but correct.

There is only *one* gable at the south end of building, the roof being returned past that gable, same as in front. The turrets at each side of said gable are shown much too high—in photo they appear to be just in line with highest point of "steps" to gable.

It is needless to call attention to minor points; I have said enough to show that the drawing is of no use to architects as a study of the grand building it so *unfaithfully* represents. The series of Belgian town-halls is unrivalled, and I have wondered sometimes that we have had no reliable drawings of some of them among your generally invaluable plates.—I am, &c., M.

WESTWOOD HOUSE, SYDENHAM.

SIR,—Mr. Lawrence's statement in your issue of the 7th inst., that the bricks for the cornices were moulded by him, is not correct. The whole of the pilasters, cornices, and other architectural features are of red brick, supplied by Mr. Lawrence, but rubbed, gauged, and moulded by hand on the job. A few bricks of different sizes were made to suit the detail of the cornices: hence the mistake. The balustrading to terraces and verandahs are built up in brick and turned. The carving is being done by Mr. Nicholls, of Lambeth.—We are, &c.,

VEITCH AND CLOSE (the Builders).

89, Stanhope-street, N.W., Jan. 18.

CHIPS.

The annual prize distribution at the Gloucester School of Science and Art took place on Tuesday week; the report showing a slight increase in the number of students, and that 20 more certificates were gained in the examination than last year, while there were 13 fewer failures; 12 Queen's prizes, and 54 certificates were gained.

On Thursday in last week a fatal accident occurred at the stone quarries of Messrs. S. and L. Cliff, at Lanehead, Brighouse. Eight men were being drawn by a crane and chain and box, from a quarry 120ft. deep, and when half-way to the surface a link in the chain opened as it passed over the jib, and the box and men fell to the bottom. All were seriously injured, and one named Heaps died soon afterwards. The chain had been used for hauling loads of stone weighing about five times as much as the men and box.

A massive tomb has just been erected in Folkestone Cemetery in remembrance of the late Mr. J. H. Challis, of Shorncliffe. It is constructed of the finest Carrara marble, weighing 19 tons, as worked, exclusive of the lining of vault, &c., and is 14th-century in character. On the principal face of the monument is a medallion portrait in statuary marble of the deceased, surmounted by his coat of arms, crest, and motto. Mr. George Prebble, of Folkestone, was the builder.

A master cabinet-maker, named William Blackwell, carrying on business in Shoreditch, was sentenced, on Tuesday, to 21 days' imprisonment by the magistrate at Worship-street, for an assault on one of his journeymen, Robert Everett.

The improvement commissioners of West Hartlepool were offered, and accepted, on Tuesday on behalf of the town, 17 acres of land to be laid and maintained in perpetuity as the Ward-Jackson Memorial Park.

The night watchman emp'oyed at the establishment of Messrs. William Cubitt and Co., builders, Gray's Inn-road, was found on Tuesday morning frozen to death.

The body of Mr. Montague Pritchard, son of Mr. Pritchard, civil engineer, of London, who was drowned by the capsizing of a boat off Montfirth on New Year's Day, was recovered on Thursday last.

The water-side premises of the Burham Brick, Lime, and Cement Company, in Belvedere-road, Lambeth, were destroyed by fire on Tuesday. The occurrence resulted from the abnormally high tide slaking the stores of lime.

A new café and hall, to be known as the Dalrymple, are about to be built at Fraserburgh, from the designs of Messrs. Jenkins and Marr, architects, Aberdeen.

Intercommunication.

QUESTIONS.

[6361.]—**Sewage Sludge.**—I should be glad if some of your able correspondents will give us the latest information on the treatment of this plague of sanitary engineers. I have seen and read of almost every form or process of mud manipulation, but what I ask for more particularly is practical results and facts. Much has been said and written about native guano, special manures, and cement-making. Will some correspondent kindly say where a valuable and saleable manure as a product of sewage sludge is being made, what price it sells for, and how much has been sold at this price, bonâ fide, during the past year? Also as to the cement manufacture, what price per ton does the cement sell for? Has it been sold in large quantities for important works, and where used? Practical information and facts are wanted. I can filter a gallon of crude sewage and make it clear as spring-water. I can make a ton of excellent manure or of cement, but what do these processes cost, and what is the amount realised in the sale? Four or five pounds per ton for manure reads very well, but if anybody wants a few thousands of tons of sewage sludge to operate upon I can find it him gratis, and leave him all the profit,—J. B.

[6362.]—**Damp Walls.**—The front door of my house opens into a small entrance hall, about 15ft. by 10ft. Out of this is an open staircase, leading up to the first-floor, and off the landing of this floor another open staircase leading up to the next floor. The walls of the hall and first stairs are paper, and varnished. Above this the walls are colour-wash. Whenever there is a fall in the temperature the whole of the varnished walls are streaming down with wet, and although there is nothing of this to be seen on the colour-washed walls on the top stairs and landing, the dampness seems to spread throughout the whole of the house, so much so that I fear the health of the family suffers from it, and I should feel extremely obliged if some kind friend could suggest a remedy. Would a stove placed in the hall, and a ventilator in the ceiling do any good? I have not tried anything of this sort, for I have felt afraid of introducing warm air, lest it should have the effect of drawing out the damp. I ought to state that the walls are stone, and were built without a damp-course, but the excess of moisture only shows itself when there is a change in the weather.—W. G. C.

[6363.]—**Choir Stalls.**—In the choir of Bangor Cathedral, as fitted up some years ago by Sir G. G. Scott, the westernmost stall on each side is canted on plan, so as to face their occupants, the Dean and Residentiary, towards the N.E. and S.E. corners of the chancel respectively. I see in Bowman and Crowther's "Churches of the Middle Ages," that a similar arrangement exists at Nantwich, Cheshire. Are there any other old examples in England?—V. M.

[6 64.]—**Flitch and Truss Beam.**—I shall be greatly obliged if some of your numerous readers would favour me with the safe load a flitch beam (for a store) of the following dimensions will carry, or a formula for calculating the same:—Length of beam, 25½ft.; distance between supports, 24ft.; two 12¾ by 4½ Baltic fir planks, with ¾in. wrought-iron plate in middle, bolted at every 2ft. The beam is also trussed on both sides, with inch tie-rods, which pass underneath two cast-iron plates, which form two struts 12in. deep, and dividing the beam into three equal parts, the truss rods rising at ends of beam to within 3in. of top.—W. McB.

[6365.]—**Party-Wall.**—Thirty-four years ago A. and B. owned two two-story cottages, the gable ends of which (each half-brick wall) abutted upon each other and supported the floor and roof-timbers of the respective dwellings. A. pulled down his cottage and erected on its site a malt-house of greater height. In the progress of the work A. removed the half-brick gable wall and put up another wall of half-brick as high as the gable of the cottage belonging to B. Above that height he built a one-brick (9in.) wall, one half of which hung over and rested upon the wall of B. 1. Is this one-brick wall a party-wall? 2. Is it, or half of it, the wall of B? or (3) is it the wall of A.? A. having acquired an easement to the extent of 4½in. over the property of B., who has now pulled down his cottage, and is intending to erect a higher building; and (4) has B. a right to insert timbers in the 9in. wall erected by A. thirty-four years ago?—PARTY WALL.

[6366.]—**Churches with Thatched Roofs.**—*Notes and Queries* for the current week quotes a number of churches with thatched roofs. In Cambridgeshire, that of Coveney. In Norfolk, Tivetshall, St. Margaret (chancel only), Ingworth (nave), Thurgarton, Trimingham (chancel), Paston, Ridlington, Ormesby, and Norwick St. Ethelred. In Suffolk, Middleton, Pakefield, South Cove, and Fritton. I do not remember having met with any thatched churches save in the Eastern Counties. If such in other parts exist, it might be interesting to record them.—HARRY HEMS.

[6367.]—**Frost Prevention.**—The *Standard* of 17th inst. says: "There are small mechanical contrivances by which we can easily enough prevent the bursting of pipes, the freezing of cisterns, and the blowing up of boilers." Safety valves I know, but what are the other mechanical contrivances alluded to?—ZERO.

[6368.]—**Bricklayers' Charges.**—Mr. Laird, a bricklayer, contracts to do the brickwork of seven cottages and one shop, all to be finished in a workmanlike manner, to the satisfaction of any competent judge. This shop-cellar is built, but a flood comes, caused by the river, and consequently the cellar alluded to is washed down by it. These cellar-walls are again built by this bricklayer. Now, are we justified in paying this bricklayer extra money for the rebuilding of this cellar or not?—A. S.

[6369.]—**Thrust of Vault.**—Will one of your readers inform me whether the following method for finding the thrust of a vault is correct? Calculate the weight of the arch or vault comprised in one compartment or between two adjacent piers; then the thrust may be considered equal to this weight multiplied by the length of diagonal groin, divided by 16 times the rise of the arch.

If correct, please explain what is meant by "compartment" in such a case?—S. M.

[6370.]—**Chambers' Proportions.**—Are Chambers' Proportions of the Modern Orders the usually accepted ones?—S. M.

[6371.]—**Stone Work.**—We have been doing stonework to some offices where quantities were given. The stone used exceeds that given in the quantities. Can payment for the extra quantity be legally withheld?—YORKSHIRE.

[6372.]—**Architects' Charges.**—I have carried out plans for villa, the total cost of which, as per estimates, was £500. Since the building was commenced several additions have been made by the proprietor in the different trades, which will bring the cost to considerably more than the £500. What must I charge for the extras? Can I calculate for the commission on the total cost at finish over and above the £500?—JUVENILE.

[6373.]—**School Plans.**—It would greatly oblige me (a reader of your paper for several years) if some one could tell me the number of boys each class-room is intended to seat in the new City of London School. There are 20 class-rooms, and general size is 24ft. × 22ft. Is 40 the number? If so, 13ft. 6in. is about the surface space per boy. Is this a good allowance? In some schools I find a much larger allowance. What space should be allowed in class-rooms where a large school-room is also provided in a large boarding school?—NOR.

REPLIES.

[6351.]—**Openings.**—The openings mentioned by "Rombald" are all large ones, and, in the ordinary course of measuring, would be deducted, especially the stage opening 22ft. by 20ft., unless a great deal of extra labour, not stated, has been performed. If it is stated in the contract that openings are not to be deducted, a different construction, of course, must be put on the matter; but the case is hardly fully stated enough to enable a satisfactory answer to be given.—G. H. G.

[6352.]—**Wall.**—The answer to "Leo's" question would depend on the crushing resistance of the bricks of the lowest course. This being obtained, the problem is reduced to ascertaining the height to which a section of the wall, say. 1ft. square, could be built before its weight equalled the crushing weight per foot. Practically the crushing of the bottom course would presuppose the bricks all to be of the same degree of hardness (a by no means possible thing) and an equal bonding in the brickwork of the wall.—G. H. G.

[6352.]—**Wall.**—Taking the crushing pressure in lbs. per square inch of brickwork to be 800, and the weight of a cubic foot of brickwork 112lb. Let x = ht. above bottom course of BW in feet. Then $x \times 15 \times \frac{3}{4} \times 112$ = weight of BW resting on bottom course. Area of bottom course = $15 \times 12 \times 9$, and this × by 800 gives pressure that bottom course will support, $\therefore x \times 15 \times \frac{3}{4} \times 112 = 15 \times 12 \times 9 \times 800$, $\therefore x = 1{,}028$ft. 6in., and 3in. added to this will give height from ground = 1,028ft. 9in. —H. S., Belfast.

[6354.]—**Measuring Zincwork.**—A 6ft. chimney-pot, with a bend or elbow in it, is usually charged as 6ft., and the bend extra on, according to the amount of extra work in it.—T. E. JULIAN.

[6358.]—**Stone Shield.**—If a "Constant Reader" will refer to Cussans' "Handbook of Heraldry," page 51 (chapter on Tinctures), he will read that:—"Ermine is represented by an argent field, powdered with sable 'spots,' whilst ermines is the reverse of ermine, being sable, powdered with argent 'spots.'" Such being the case, his course is simple. No. 1, 2, 3, and 4A being ermine, the ground (field) is left perfectly plain, argent (silver) always being shown so in carved work, whilst 2A and 4, being ermines, their fields are sable (black). In engraving and sculpture, sable is denoted by parallel and perpendicular lines crossing each other at right angles, each line being separated from its neighbour by about the width of itself.—HARRY HEMS.

[6359.]—**Mathematical Question.**—AB = 15, BC = 9, AC = 12. Cos. $A = \frac{AC^2 + AB^2 - BC^2}{2AC \times AB}$. Cos. $A = \frac{144 + 225 - 81}{2 \times 12 \times 15} = \frac{288}{360} = \frac{4}{5}$. $\therefore$ cos. A = ·8000 = cos. 36° 52′.—D.

CHIPS.

A new drill-hall, for the use of the 1st North York Artillery Volunteers, was opened in Grange-road, Middlesbrough, on Saturday. It measures 114ft. by 45ft. in the company-drill part, and 90ft. by 30ft. in the portion used for gunnery exercises. It is built of bricks with white facings, and is open-timbered. Adjoining is an officers' room, with sergeants' room above, and a clothes-store next the roof. Captain S. E. Hill prepared the plans and designs, and Mr. Balsher, of South Bank, Middlesbrough, was the builder.

A new block of public buildings is about to be erected in Boscawen-street, Truro, the principal thoroughfare in the city; indeed, until modern improvements took place at Plymouth, it was considered the widest street in Cornwall. The new buildings will consist of a corn-exchange, post-office, and a private shop, and will be Classic in style, agreeing with the adjoining market and town-hall. The ground-story will be of granite, and the upper portion of the street frontage of freestone. The corn-exchange, which will be placed to the rear, will be 70ft. by 25ft. Mr. Silvanus Trevail is the architect.

The chancel of the Episcopal Church at Kirkwall, Orkney, was destroyed by fire on Sunday morning, owing to an escape of gas ignited by the heating apparatus.

STAINED GLASS.

BIRMINGHAM.—Another two-light window in the north aisle of the New Church, Wretham-road, Soho Hill, has been filled with a subject in stained glass. The subject selected is from Matt. xix. 13, 14. It depicts, in the right-hand light, Our Lord, while in the act of receiving two children (who are bending before Him), rebuking His disciples for their endeavour to keep them from Him. In the immediate front is the mother of the two children, with her back to the spectator, gazing in adoring wonder at the act and words of Our Lord. To Our Lord's left is a group of children, one of whom is nestling in the folds of His robe, betokening the confiding and simple faith of a child. To the right-hand of Our Lord are the Apostles, Peter, James, and John, who evidently feel the rebuke, and a mother presenting her child for the Divine blessing. In the foreground are wild roses, lilies, and other flowers; in the middle distance and over Our Lord's head are trees, boldly treated, and between their trunks are seen the walls of a city and the evening sky. The subject is placed beneath a lily canopy. In the quartrefoil tracery an angel holds a scroll with the text: "Suffer little children to come unto Me, and forbid them not." The work has been executed by Messrs. Camm, Bros., of Smethwick, at whose establishment the whole of the other windows in the church were also produced.

BINGLEY, YORKS. — A two-light stained-glass window has just been erected in the old parish-church; the scheme of the design being an illustration of the "Te Deum," each light containing groups of figures representing respectively angels, apostles, prophets, martyrs, and the Holy Church. The principal piece of tracery contains the "Agnus Dei," and the smaller traceries the sacred monogram. Below the window is a handsome memorial brass to the children of Mr. S. Wildman, of Bingley, in whose memory the window is erected. The window and brass were designed and executed by Messrs. Shrigley and Hunt, John o'Gaunt's Gate, Lancaster, and 28, John-street, Bedford-row, London.

BUCKNALL.—A stained-glass window has been presented to Bucknall Church, and was unveiled on Christmas Day. It consists of the central light of the three east lancets. The subject is "St. Mary and St. John in contemplation of the Ascension." It is the work of Messrs. Camm, Brothers, of Smethwick.

HALIFAX.—The Wesleyan Church of St. John has been engifted with a handsome stained glass memorial rose-window, from the atelier of Powell Bros., Leeds. It contains four large figure-subjects, surrounded by ornament of a very rich description, both in colour and detail. The subjects are the calling of Samuel, Solomon building the Temple, Christ blessing little children, and St. Paul preaching at Athens. The wall-space beneath the window has also received some slight decoration from the same artists.

HEMINGBOROUGH, NEAR SELBY, YORKSHIRE.—A stained-glass west window (memorial) has just been erected in this fine old 15th-century church, some portions of which are of even anterior dates. The subject, which occupies the whole of the five lights, is "The Crucifixion," with some of its more salient accessory features. The notable feature of the treatment of this window, admirably suited to the tone of the surrounding architecture, is that it is in the style of, and reproduces the characteristics of, the celebrated York-minster glass. The artists are Messrs. Powell, Bros., of Leeds.

HODDESDON CHURCH, HERTS.—A two-light window has just been erected in this church. The subject selected by the donors was "The Sermon on the Mount." In the dexter light is a seated figure of Our Lord, surrounded by his Apostles, delivering his sermon to the multitude, which occupies the sinister light. Each subject is surmounted by a rich canopy. In the base, beneath small canopies, are seated figures of the four Evangelists. The tracery contains a floriated cross with the text, "Blessed are the pure in heart," &c. The window was designed and executed by Messrs. Shrigley and Hunt, John o' Gaunt's Gate, Lancaster; and 28, John-street, Bedford-row, London.

QUERNMORE CHURCH, NEAR LANCASTER.—A two-light stained-glass window has been placed in the church, containing two single figures of the Angels of the Resurrection bearing trumpets. The tracery contains the "Agnus Dei." The window was designed and executed by Messrs. Shrigley and Hunt, of Lancaster and London.

WYKE, YORKSHIRE.—A memorial stained-glass window has just been erected in this church, dedicated to the memory of the late Rev. C. W. Houlbrook, formerly vicar of the parish. The subject is from Matt. xiv., 30—viz., Peter, whilst walking to Jesus on the sea, fearing and beginning to sink, cries, "Lord, save me," which is the legend text in base. The window is from the studio of Powell Bros., Leeds.

STATUES, MEMORIALS, &c.

"A GOOD NAME IS BETTER THAN RICHES."—Under the above heading the *Exeter and Plymouth Gazette* for January 1st, 1881, says:—"As the last ray of sunshine in the expiring year streamed fitfully through the painted windows of the south aisle of Heavitree Church yesterday afternoon, it illumined momentarily the forms of the workmen who rested from their finished labour. On the wall of that aisle, near to its eastern end, they had just placed a mural tablet of pure statuary marble. The superscription thereon reads: 'Stephen Shute, 13 years a member of the choir of this church. He was—as a working statuary, singularly skilful; as a foreman, beloved by man and master; as a Christian, humble and sincere. Called away September 3rd, 1880, aged 42. This tablet was erected by one in whose service he died, and who mourns him as a brother.' The monument is a parallelogram measuring about 3ft. by 2ft. Its statuary marble slab is moulded and polished, and quietly enriched by incised ornament. Around the whole is a border of grey dove marble." Mr. Shute's almost sudden death from cholera, just after his return home from Belgium last autumn, was recorded in these columns at the time (Sept. 17th). A widow and nine children were left to mourn his loss, and for these a subscription started realised nearly £100. Amongst those who helped in the good work are the names of numerous architects and clergymen, with whom poor Shute (in his capacity of travelling-foreman for Mr. Harry Hems) came into contact with in different parts of the country, as well as not a few of his old operative friends. Amongst the latter are the clerks of works of two new cathedrals at present in hand—Mr. J. Willis, now representing Mr. G. Gilbert Scott, M.A., F.S.A., in that capacity at the cathedral building at St. John's, Newfoundland, and James Bubb, the clerk of works at Mr. J. L. Pearson's, R.A., new cathedral at Truro. It is possible that other of our readers who may not have already contributed may like to do so.

LEGAL INTELLIGENCE.

A BOROUGH SURVEYOR ON THE CHEMISTRY OF PLASTER. — ADAMS v. ARMSTRONG.—This claim, heard on January 13th before the County-court Judge at Margate, was for £10, balance of account in respect of the building of two cottages for the defendant.—The case was adjourned from last court day, when it was stated by the defendant that inferior mortar was used, and that, consequently, the walls of the cottages were damp. An adjournment was ordered, that the Borough Surveyor (Mr. Albert Latham, C.E.) might report upon the matter. The following report we take from the *Thanet Guardian* of the 15th inst. The Judge (to Mr. Latham): You have investigated this work, have you? Mr. Latham: I have, your Honour.—The Judge: And what is the result you have arrived at?—Mr. Latham: Do you wish me to report on the subject?—The Judge: If you please.—Mr. Latham: Generally? or specially as to the quality of the plaster? The Judge: As to the quality of the plaster and generally also. Mr. Latham: In company with the plaintiff and defendant, I took an opportunity of visiting the premises, and of obtaining samples of the plaster. The difficulty arises from the fact of the efflorescence of nitre, commonly called saltpetre, upon the surface of the plaster. The question is, "From what cause does this arise?" To my mind, from the presence of *salt in the work* and of *organic matter in the materials of which the plaster is composed.* The organic matter in the material was in the *shape of nitrogen;* therefore, we have salt, water, nitrogen, and atmosphere; and the result is that the *vapour crystallises* and is deposited in the *shape of saltpetre,* and has blown off or raised from the surface the wall-paper, which is practically destroyed. The Judge: Quite so. Mr. Latham: I have had given to me a copy of the agreement. I believe it is acknowledged by both parties to have been correct, and the fourth section says that the plaintiff "is to render and set all external walls with good hair-mortar." I have been told by Mr. Adams that, although this was the letter of the contract, there was also an implied contract that he was to use garden-mould. It is the presence of this garden-mould, together with salt, which has brought about all this trouble. The Judge: Quite so. Mr. Latham: Then comes the question as to whether the words "to be set with good hair-mortar" mean that it is to be of the best class of workmanship, or what is usual in cases of this class? The Judge: I shall put the latter construction upon it. Mr. Latham: It is a fair sample of work for cottage property. The Judge. Do you call the work average work considering the class? Mr. Latham: As a professional man, perhaps I am inclined the other way. There is hair in the mortar, but not so much as I should like to see in good work, and the setting is tender. The Judge: Quite so. Mr. Latham: I should say that the sample of mortar produced last court day is not a fair sample. The

Judge: Still, you say the work comes up to the conditions. Mr. Latham: I should hardly like to say so; but, having talked the matter over with the plaintiff and the defendant, I have come to the opinion that it would be advisable for them to come to a compromise in the re-papering of the house, which would cost about £4 each. The Judge (to the plaintiff): Are you willing to assent to that course? The plaintiff: I hardly agree, as I told the defendant it was too early to paper the walls. The paper has been blown off the walls by the damp. Mr. Latham: I don't agree with that, as the damp only would not cause efflorescence. The defendant: You have not reckoned the stair-walls. Mr. Latham: That will be £1 each. The Judge (to Mr. Latham): I am obliged to you for your valuable assistance and report. I shall adopt your suggestions as to the case before me. The plaintiff sues for £10; I shall give him judgment for £6. The plaintiff: And the costs, please? The Judge: The usual costs; to be paid in seven days.

A CLIENT'S DIFFICULTIES WITH HIS BUILDER AND ARCHITECT.—At Derby County-court, on Tuesday, before Mr. Woodforde, judge, the case of G. Pemberton *v.* F. Parkes was heard, in which £39 4s. 9d. was claimed for work done. Defendant is a medical galvanist, who, desiring to build premises in Burton-road, Derby, employed Messrs. Sheffield and Hill as architects, the work being performed by the latter. The contract was taken by builders named Birkumshaw, and on their failure a Mr. Bakewell was called by the trustee to complete the work; but after a time he declined to go further, and a difference arose between defendant and Mr. Hill, his architect. Plaintiff then took up the contract, and he set his men to work from the 3rd to the 10th May, for which £10 4s. 9d. was now sued for. An altercation then took place between plaintiff and defendant, and the former took his men away but defendant having called at his office, plantiff consented to recommence work, which reached the sum of £29, in addition to the sum already incurred. Plaintiff was referred by defendant for payment for the recommenced work to Mr. Hill, against whom defendant's counsel now made allegations of neglect. After a long hearing, it transpired that an action had been commenced against Parkes by the trustee for Birkumshaw's, the original contractors, and his honour eventually gave judgment of non-suit.

A CURIOUS VERDICT.—WORTHINGTON v. SUDELL.—This case was tried on Monday in the Queen's Bench Division (before Mr. Justice Bowen and a common jury,) and was brought by an architect to recover £151 as remuneration for preparing plans for repairing and rebuilding a publichouse in the Gray's Inn-road. It was agreed by counsel that the amount, if any, to be paid to the plaintiff should be £151, being 5 per cent. on the proposed outlay, and also some out-of-pocket expenses. The defence was that the plaintiff was instructed to prepare plans which would represent an outlay of from £1,500 to £1,800, whereas those which were prepared could not be carried out for less than £2,400. The plans were prepared in 1875, and no claim was made until five years afterwards. The explanation given for this was that the defendant had left the neighbourhood, and his address was not known to the plaintiff. The jury retired to consider their verdict, and when they returned the foreman said that the jury had agreed upon a verdict for the plaintiff for £45. His Lordship, however, explained to them that the parties had agreed upon the amount, and that he cou'd not take the verdict for the amount which they mentioned. They then retired to consider their verdict again, and in the result they returned and found a verdict for the defendant. His Lordship stayed execution.

ALLEGED INACCURACY OF CONTRACT PLANS.—An arbitration took place at Newmarket, on the 13th inst., in reference to the sewerage works in course of construction at Exning, between Messrs. Saint Brothers, of St. Ives, the contractors, and the Newmarket local board of health, the sanitary authority. In February, 1880, tenders were invited for levelling and draining about six acres of land for sewage utilisation. The lowest tender was accepted, that of Messrs. Saint, at £380, and the contract was entered into in due course, the contractors basing their estimates upon the plans and specifications furnished by the surveyors to the local board, Messrs. Clark and Holland, of Newmarket. Soon after the works had been commenced, it was discovered by the contractors that a larger quantity of work would have to be done than was anticipated by them when they estimated for the tender, and it was alleged by them that the plans and specifications supplied by the board were inaccurate. In accordance with a clause in the contract, the dispute was referred to two arbitrators and an umpire. The umpire appointed was Mr. Angel, architect, of London; while Mr. R. R. Rowe, of Cambridge, diocesan architect for Ely, acted as arbitrator for the claimants, and Mr. C. Pritchard, of Birmingham, civil engineer, was agreed to in the same capacity for the local board of Newmarket. The plans and specifications having been put in, the claimants called Mr. Pooley, civil engineer, of Cambridge, who deposed that the plans were inaccurate and misleading. Mr. Rootham, builder, of Cambridge, confirmed this evidence, and the Messrs. Saint detailed what had occurred between them and the surveyors to the board. On the part of that authority it was contended that inasmuch as the advertisement had stated how much levelling would have to be done, the plaintiffs ought to have known what they were about, and that if they had entered into an improvident contract it was their fault, and not the board.—Mr. J. F. Clark, of Newmarket, one of the surveyors to the board, gave evidence in favour of the plans. In cross-examination he admitted that certain transverse sections on the plans were incorrect. They had been made by a clerk in his office.—At the close of the inquiry the umpire and arbitrators announced that the award would be given on or before the 1st March.

A SURVEYOR'S CERTIFICATE NOT NECESSARY TO PROVE COMPLETION.—LEWIS v. HOARE.—This was an appeal to the House of Lords, on Tuesday, from a judgment of the Court of Appeal reversing the judgment, after trial, of Mr. Baron Huddleston. The action was originally brought by the respondent against the appellant upon a guarantee to the following effect:—"In consideration of your advance to Mr. Thick's authority of this date, I hereby promise to pay you £110 on completion of six houses, in accordance with a contract of this date between myself and Mr. Thick." It appeared that Mr. Thick was a builder, and that he had agreed to erect certain houses, for which he was to be paid on obtaining a certificate from the surveyor that the buildings were complete in accordance with the contract. The question left to the jury at the trial was, whether or not the houses could be said to have been completed before action brought, the builder not having received the certificate to that effect from the surveyor. The jury found that the houses had been completed as a matter of fact. Mr. Baron Huddleston, on further consideration, decided against the plaintiff, on the ground that the houses were not completed in accordance with the contract, the builder not having received the surveyor's certificate, and directed judgment to be entered for the defendant. The Court of Appeal reversed that decision, on the ground that the finding of the jury on the question of the completion of the houses was conclusive, and that the question whether or not the certificafe had been given did not arise. At the conclusion of the arguments, their Lordships (the Lord Chancellor, Lord Blackburn, and Lord Watson) affirmed the judgment of the Court below, on the ground that the form of the verdict made it imperative to hold that the jury found that the houses were actually completed in accordance with the contract in every particular except the actual issuing of the certificate. The issuing of such a certificate would not make the houses complete if they were not actually completed, and the withholding of the certificate would not make them incomplete if they were actually complete. The appeal must therefore be dismissed with costs.—Judgment affirmed, and appeal dismissed with costs.

IMPROPER BUILDING MATERIALS.—At the Edmonton Sessions on Wednesday, Andrew Nichols, builder, of Shacklewell-lane, was charged upon two summonses with violating the 106th bylaw of the Tottenham Local Board of Health, the material used by him as mortar in the construction of two houses in Deleview-road, Eastbournia, Stamford-hill, within the jurisdiction of the Board, not being of a character to solidly bind the bricks together. Mr. de Pape, surveyor to the Board, said he personally visited the houses on the 3rd of december, and took the four samples of mortar produced from the brickwork. He also gave notice that the walls were in a dangerous state, and they had been partially taken down. The samples were handed to the justices, who with the greatest ease crumbled the so-called mortar into dust between their fingers. The Bench ordered the defendant to pay £5 and a continuing penalty of 2s. 6d. per day for 40 days in respect of each house (£20 altogether) and costs, intimating that they were determined to assist local authorities in enforcing their bylaws.

A meeting of the local board of Bridlington was held last week, to consider the plans forwarded by Messrs. Brierley and Holt, civil engineers, to whom the premium of £100 had been awarded in a recent drainage competition. After two hours' discussion, it was decided to write to Messrs. Brierley and Holt, and suggest that the amount of tunnelling be reduced, with a view to reduce the cost of execution.

Mr. Eli Johnson, a sculptor of some repute, died at Northampton, on Friday last, of congestion of the lungs. His chief works were a bust of the late Mr. Charles Gilpin, and another of Mr. George Palmer, M.P.

Our Office Table.

THE death is recorded, at the age of 70 years, of the distinguished French architect, M. Hector Lefuel, who was born at Versailles. The pupil of his father, a capable member of the same profession, M. Lefuel early attracted notice by his diligence and accomplishments; he obtained the Grand Prix, first class, in 1829, and consequently studied at the Villa Médicis. He succeeded Visconti as architect to the Palais de Fontainebleau, and was employed to continue the works which united the Louvre with the Tuileries. In 1855 he was elected a Member of the Institute; and appointed Commander of the Legion of Honour in 1867.

THE Society of British Artists, having placed their fine galleries in Suffolk-street, Pall Mall, at the disposal of the Sunday Society, the Winter Exhibition, consisting of 945 paintings, 17 pieces of sculpture, &c., was opened to the members of the society on Sunday last between the hours of 5 and 7·30 p.m. On Sundays, January 23rd and 30th, the exhibition will be open to the public free by tickets, which will be issued by the Sunday Society to those applying by letter and sending a stamped and addressed envelope to the hononary-secretary, 8, Park-place-villas, W. This is the second time that the Society of British Artists have generously seconded the efforts of the Sunday Society.

THE death is announced of Auguste Edouard Mariette, better known as Mariette Bey, the archæologist of the modern school of Egyptology. M. Mariette was born at Boulogne in 1821, and began life as a teacher of grammar and drawing in that town, occupying his leisure in the unaided study of Egyptian hieroglyphics. In 1848 he was attached to the Egyptian Museum at the Louvre, and two years later he was first sent to Egypt on a scientific mission, the object of which was the search for Coptic manuscripts preserved in the monasteries of the country. Mariette found his way to Sakkarah, the ancient Memphis, and there began that series of excavations which will be for ever associated with his name. He discovered the site of the Serapeum, the temple and inclosure dedicated in ancient times to the worship and custody of the sacred bull Apis, as well as the long range of dated and inscribed tombs in which the bulls were buried, and which furnish a check and a verification of Egyptian chronology derived from independent sources. During his first visit to Egypt, Mariette also excavated the buried part of the Sphinx, and demonstrated anew the fact that that stupendous monument is hewn from the solid rock. Mariette remained some years in Egypt, and on his return to Europe was appointed assistant keeper of the Egyptian Museum in the Louvre. Returning to Egypt, he received the title of Bey, and was appointed by the late Khedive as Conservator of the National Monuments of Egypt and Keeper of the Museum at Boulak, an institution which may almost be called of his creation.

THE great success of the Nottingham Castle Museum of Art has encouraged art-lovers in Nottingham to form a society which now has something more than one hundred members. Its objects are the encouragement of art and the dissemination of art knowledge. Mr. S. Dutton Walker, F.S.A., is the hon. sec., and he has been very materially assisted by Mr. G. H. Wallis, the curator of the museum. Lectures have already been given by Mr. Wyke Bayliss, F.S.A., Mr. John Forbes Roberts, Mr. S. Bourne, and by Professor Marshall, of Leeds. Mr. Bourne's paper was most interesting, and described very graphically the dangers and difficulties which he encountered in his expedition for artistic purposes and for photography, in the mountain ranges of the higher Himalayas. After the lecture, Mr. Bourne exhibited his splendid collection of photographs, taken as above described. Other lectures are to follow, and the session will be wound up by a *soirée* at the Castle, when Lord Belper, the President, will preside.

IMPORTANT engineering operations are about to be carried out near the Lake of Constance by M. Honsell. The objects are, to keep the water of the lake from rising above, or sinking below, certain limits (showing a difference of level of

1·8m.), and to prevent future high waters giving a more abundant discharge than the present. The requirements of navigation, the security of the town of Schaffhausen, &c., necessitate this. The project in hand includes two operations: enlargement of the Stiegen channel (by means of wash-boards, so placed that the outflow there will not show an increase on the present till the water reaches their level); and regularisation of the bed by dredging, from the Stein bridge to a little below the confluence of the Biber, a distance of 5·575m. Full particulars of the scheme will be found in the *Archives des Sciences* of December 15.

CHIPS.

An inquiry was recently held at the Tolhouse, at Great Yarmouth, before Mr. Morgan, Local Government Board inspector, with reference to an application from the town council for leave to borrow the sum of £5,000, for paving various parts of the town with wood and concrete.

A new organ and choir-stalls, erected in Chellaston Church, Derbyshire, were used for the first time last week. Mr. Samuel Warren, of Derby, built the organ.

An enthusiastic demonstration took place at Hull on Saturday, in celebration of cutting the first sod of the Hull and Barnsley Railway and Dock. Messrs. Lucas and Aird, of Lambeth, are the contractors for the work.

The town-hall at Newbury has been altered and improved under the direction of Mr. J. H. Money, architect, of that town, by Mr. W. H. Simmonds, contractor, of Reading.

At Birmingham, on Monday week, Benjamin W. Smith, cashier in the employ of Messrs. Martin and Chamberlain, architects, was committed for trial on a charge of embezzling moneys, amounting to nearly £1,000, belonging to his employers.

The Local Board of Stapleton, next Bristol, decided, at a meeting held on Wednesday week, to carry out a complete drainage scheme for the parish, in accordance with a scheme and plans prepared by their surveyor, and at an estimated cost of £15,000.

A new school-house has just been built in connection with Holy Trinity Church, Aldershot; Mr. J. Seabright was the builder.

An inquiry was held on Wednesday week at Preston, Lancashire, before Mr. G. Thornhill Harrison, C.E., an inspector of the Local Government Board, into an application by the Preston Town Council for sanction to borrow the sum of £60,000 for public improvements. At the close of the inquiry the inspector said there appeared no objection to the sanction of the Local Government Board being given.

A new mission church for the North-end of Yarmouth was opened on Tuesday week. It is 84ft. by 26ft., and accommodates 400 persons. Mr. Newby was the contractor for carpentry work, and Mr. G. Nickerson, also of Yarmouth, for the brickwork. The cost has been about £580.

The School-board for the Forest of Dean received at their monthly meeting plans sent in by Messrs. Haddon Brothers, of London and Hereford, and others by Mr. Roberts, of Cinderford, for new schools for Steam-mills, near Cinderford. After a long discussion on the plans, a decision was postponed till the next meeting of the board. The estimated cost of Messrs. Haddon's plans was £900, and for those of Mr. Roberts £1,500.

Mr. Alfred Creer, who for nine years had been deputy borough engineer of Halifax, West Riding, was last week elected borough surveyor of Lancaster, from amongst 176 candidates.

The town council of Carlisle received last week a letter from the secretary to the Royal Archæological Institute, accepting, on behalf of the Institute, the invitation from the council to visit the city in 1882.

Mr. George Rice Jay, for many years borough surveyor of Maldon, died on the 13th inst., at the age of 77 years.

The town council of Hull, on Thursday week, decided to raise the salary of the waterworks engineer, Mr. D. Maxwell, from £350 to £450 per annum.

A Corporation report states the cost of the Temple-bar memorial to be £10,690 6s. 7d. Of this £5,260 is payable to Messrs. Mowlem and Co. for the foundations, scaffolding, granite work, masonry, carving and modelling; £2,152 to Mr. Boehm, R.A., for the statues in marble of the Queen and Prince of Wales; £1,081 to Mr. Birch, A.R.A., for the "Griffin" in bronze; and £1,603 15s. for the basso-relievos.

The annual exhibition of the Dublin Amateur Artists' Society was opened last week, and the newspapers of that city state that the standard of the work is much superior to last year. The judges, Sir G. Hodson, Sir Thos. A. Jones, P.R.H.A., and Mr. Thomas Drew, R.H.A., report that there is shown much careful study and observation of natural effects, and that they were particularly pleased with several studies of landscapes direct from nature, especially with No. 319. Regret is expressed that, as was the case last year, there has been no competition in figure subjects and heads. They award the prizes thus:—Section A: figure subjects and studies of heads—no awards. Section B: landscapes from nature (oils)—1st, Mary Kate Benson (secretary of the society); 2nd, Charlotte E. Benson; commended, Mary K. Benson. Do. (in water-colours)—1st, Mary Kane; 2nd, Charles D. Manley; commended, Dora Martyn and Edith Cane. Section C: animals—1st, not awarded. 2nd, Mary K. Benson; Section D: pictures from sketches (oils)—1st, J. M. H. Todhunter; 2nd, Mary K. Benson. Do. (in water-colours)—1st, Dora Martyn; 2nd, Edith Cane. Section E: flowers (in water-colours)—1st, Miss Godfrey. Section F: illustrations—no prize awarded. Special prize for study of distance, Mary K. Benson.

A new work, entitled, "Chapters from the History of Old Saint Paul's," by Dr. W. Sparrow Simpson, editor of "Documents Illustrating the History of St. Paul's" (Camden Society), is in the press, and will be published shortly by Mr. Elliot Stock.

A new aisle has been added to St. Peter's Church, Galashiels, which will accommodate 180 persons, the previous amount of space sufficing for 300 sitters. The cost was about £1,000

It was reported at the last meeting of the town council for Pembroke, that seventeen replies had been received to the advertisements of the council, offering the munificent premium of £25 for the best scheme for supplying the town with water.

The local board of Torquay last week received the sanction of the Local Government Board to the borrowing of £22,425 for the purpose of forming a new storage reservoir, and extending the water-supply of the town.

Mr. C. Wentworth Wass, who for more than 22 years has occupied the post of superintendent of the picture-gallery at the Crystal Palace, was last week presented with a testimonial consisting of a silver salver and a purse of 200 guineas on his retirement. Regret was expressed that this feature of the palace was likely, for financial reasons, to be discontinued.

Mr. Boehm is actively engaged upon a statue which is to be erected in Waterloo-place, as a memorial to Lord Lawrence. The site is south-east corner, and the size of statue, character of pedestal, are to correspond exactly with the memorial to Sir John Burgoyne, also the work of Mr. Boehm, which stands opposite.

New parochial infant-schools for St. Mary's, Lambeth, were opened by the Archbishop of Canterbury, on Monday week. The building adjoins Lambeth Palace, and is of red brick; it is planned as a large hall, with class-rooms at each end. The cost has been £2,750, and accommodation is provided for 270 children. Mr. J. P. Seddon was the architect.

The parish-church of East Carlton, Norfolk, was opened on Thursday, the 13th inst., after restoration, including a new roof, extensive repairs to walls and windows, and entire reseating.

A stained-glass window has just been placed in the Abbey Church of Romsey, Hants, representing Christ leading the Blind Man.

A mission-chapel is about to be built for the hamlet of Wick, near Lyminster, Sussex, Mr. W. Street is the architect; the building is to seat 200 people at an estimated cost of £1,000.

A new post-office and other buildings have just been erected at Haverfordwest, for the trustees of Sir John Perrott's Charity. Messrs. Morgan and Thomas were the builders.

New business premises, built for the Accrington and Church Industrial Co-operative Society (Limited), at Antley, Accrington, were opened last week. The joiners' work has all been executed by the men in the Society's joinery department, under the direction of Mr. G. A. Whiteside, foreman, and the rest of the work was let to local contractors. Mr. Henry Ross, of Accrington, is the architect employed by the Society.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill. *Use no substitute.*—[ADVT.]

Holloway's Pills thoroughly purify the blood, completely cleanse the lungs, reinvigorate debilitated or vitiated nervous action, strengthen the muscles, and clear the brain. These excellent Pills are particularly recommended to all persons whose occupation is sedentary or conducted in close rooms, and to the nervous, dyspeptic, and the low spirited.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—London Institution. "Problems in the History of Civilisation." By Dr. E. B. Tylor, F.R.S. 5 p.m.

WEDNESDAY.—Society of Arts. "Suggestions for Preventing London Smoke." By W. D. Scott-Moncreiff. 8 p.m.

THURSDAY.—Society of Arts. "A New Mechanical Furnance and a Continuous System of Manufacturing Sulphate of Soda." By Jas. Mactear, F.C.S. 8 p.m.

London Institution. "The Manufacture of Indigo from Coal." By Prof. H. E. Armstrong, F.R.S. 7 p.m.

Society for the Fine Arts. "Book Decoration." By J. W. Bradley. 8 p.m.

SATURDAY.—St. Paul's Ecclesiological Society. Annual meeting. 2 p.m.

Throat Irritation.—Soreness and dryness, tickling and irritation, inducing cough and affecting the voice. For these symptoms use Epps's Glycerine Jujubes. Glycerine, in these agreeable confections, being in proximity to the glands at the moment they are excited by the act of sucking, becomes actively healing. Sold only in boxes, 7½d. and 1s. 1½d., labelled "JAMES EPPS and Co., Homœopathic Chemists, London." A letter received: "Gentlemen,—It may, perhaps, interest you to know that, after an extended trial, I have found your glycerine Jujubes of considerable benefit (with or without medical treatment) in almost all forms of throat disease. They soften and clear the voice. In no case can they do any harm.—Yours faithfully, GORDON HOLMES, L.R.C.P.E., Senior Physician to the Municipal Throat and Ear Infirmary."

Trade News.

WAGES MOVEMENTS.

NORTH WALES SLATE TRADE.—The slate trade of North Wales still continues very dull, and although notices have been given of an extension of full working time at the Oakley quarries, Festiniog, several of the smaller quarries remain closed. The adoption of the Employers' Liability Act threatens to give rise to some trouble. Mr. Assheton Smith, the owner of the Llanberis quarries, has notified to his workmen that in the event of their refusal to contract themselves out of the Act he shall reconsider the arrangement under which he supports the quarry hospital and allows pensions to widows of men killed in his employment. The matter has been referred to the North Wales Quarrymen's Union, the Council of which, after receiving statements from most of the quarries comprised within the district of the organisation, have decided upon recommending the men to adhere to the original resolution arrived at, and not to contract themselves out of the Act.

CINDER-SIFTING ASH CLOSETS
Superior to Earth Closets. For Gentlemen's Houses, Cottages, Schools, &c.
NO DRIED EARTH REQUIRED.
The Sanitary Appliance Co. (Ltd.), Salford.

Doulting Freestone and Ham Hill Stone of best quality. Prices, delivered at any part of the United Kingdom, given on application to
CHARLES TRASK,
Norton-sub-Hamdon, Ilminster, Somerset.
—[ADVT.]

McLACHLAN & SONS, 35, St. James's-street, S.W. Builders, Decorators, and House Painters. Designs and Estimates.
General Repairs and Alterations Executed.
Experienced Workmen always in readiness, and sent to any part of the country.—[ADVT.]

BATH STONE.
SUMMER DRIED,
CORSHAM DOWN,
100,000 Feet Cube.
PICTOR & SONS, BOX, WILTS.
[ADVT.]

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender—it adds to the value of the information.

EXETER.—For new factory, Fore-street, Exeter, for Messrs. Lloyd and Son. Messrs. C. Shoppee and Sons, 22, John-street, Bedford-row, London, architects. Quantities supplied by Mr. H Shoppee:—

Brass, London	£12,478	0	0
Pethrick and Co., Plymouth ...	10,984	0	0
Stephens and Sons, Exeter ...	10,484	0	0
Jones and Co., Gloucester ...	10,290	0	0
Clark	10,269	0	0
Claridge, Banbury...	10,095	0	0
Stephens and Bastow, Bristol* ...	9,859	0	0
Brand and Co., London	8,300	0	0

* Accepted.

THE BUILDING NEWS.

LONDON, FRIDAY, JANUARY 28, 1881.

THE GOOD AND BAD OF THE SEMI-CLASSIC REVIVAL.

BY the "semi-Classic revival" we mean, of course, the revival of what is commonly, and inaccurately, called the "Queen Anne" style: that half-English, half-Dutch mode of building which seems to have come into fashion round London in or before the reign of William III., and which lingered on till domestic architecture, properly so-called, almost died out amongst us. From the middle of the 18th century till now, plenty of architecture, better and worse, has been applied to domestic buildings of the more expensive class; but the greater part of it has not really been domestic architecture at all. There has been no everyday style, no prose style, no style for common purposes. Nearly everything that pretended to style at all has been put into a monumental style, or a sham monumental style. While the temples of Greece, the palaces of Rome, and the churches of Mediæval Europe have been ransacked to furnish bits of detail for the adorning of city shops and middle-class villas, we have even been assured by those eloquent writers about art, who are so much more abundant in our times than in those when art grew and flourished, that all this is as it should be, and that our only fault lies in not carrying the process far enough. We ought, it appears, to have gone a stage further, and not only to have filled our house-fronts with pointed arches and window-tracery; but to have covered our rooms with cross-vaults in brick or stone, if there was the least intention of making them truly Gothic. Similarly, no doubt, we should never build so much as a cottage without stone lintels and cornices, if we wish our work to be truly Classic; for the Classic-temple style is as essentially based on stone-lintel construction as the Gothic-cathedral style is based on arches and vaulting. It is this sort of teaching, by the way, which led to all the horrors of stucco and sham-fronts,—two devices to get the effect of monumental architecture without its cost; and it is this teaching which has made the most beautiful thoughts of bygone artists trite, if not repulsive, by the perpetual mixing-up of them with the vulgar and the sordid. But is not monumental architecture (people have asked) the highest class of architecture? and when we can copy the highest, why should we, for any purpose, copy anything lower? Is not poetry (it might be answered) the highest class of literature? Why, then, on your principle, should not all literature be poetical? Monumental, or as it might almost be called, rhythmical architecture, is the poetry of building, and the man who feels no incongruity in applying it to shops and banks and warehouses, ought to feel no incongruity in a rhymed *Daily News* or a blank-verse *Times*.

One of the strongest points in favour of the revived semi-Classic is, that it is a reaction against all this misplaced monumentalism. It is an admission that the common-sense of the world is right, when it says there ought to be a radical difference between a cathedral and a cottage. It is a return to a prose style for prosaic subjects, and to a slight and relatively temporary style for slight and temporary purposes. Such purposes there always have been, and always will be, and it ought to be possible, now and here, as well as in other times and distant places, to fulfil them artistically. We have heard plenty of declamation against short building leases, and should be glad enough, were it practicable, to see them done away with. Permanence is a good thing when it can be had; but it cannot be had everywhere, and the architect's business is to do the best under the actual conditions he meets with. To-day he may be dealing with some great national work, meant to last for ages; and to-morrow with some trifling structure likely to vanish before the next generation; the problem is to make both of them fulfil their purpose the more satisfactorily while they last. To do this, the two subjects must be treated very differently in all respects. It is not monumental Gothic alone that does not lend itself with fitness to shops and cottages; it is the monumental phase of every great style that ever existed. We do not get much ocular proof of this amongst the remains of past styles—for the plain reason that the permanent in them has endured, while the temporary, with a few chance exceptions, has passed away. A moment's thought, however, will show that it must have been so. The wildest dreamer of all the dreamers who for the last fifty years have taken upon themselves to direct the workers amongst us, could not imagine that the Egyptian people ever lived in houses constructed as the Egyptian temples were. But ought some art-prophet thereupon to have stood up and testified against them? Should he have said, "It is of no use your trying to build in the Egyptian style, unless you adopt the very same construction all through your dwellings, which you see in the temples?" They built, no doubt, in a very temporary way, with no sort of attempt at the same class of construction; and yet, in an unpretending manner, it is easy to believe that their temporary works harmonised with and gave added dignity to, the almost eternal structures beside them. So it was with the Greeks—so with the Mediæval builders; so it is with the Mahometans almost down to this day. There is, and there was with all, a monumental way of building for monumental purposes, and a temporary or half-temporary way for ordinary ends; a noble vein of poetry for adequate occasions, and a good honest sort of prose for daily life. This is one of the most essential things which the leaders of the semi-Classic revival have recognised, or, to speak more truly, have only half-recognised, as yet.

If there had been existing amongst us a multitude of precedents showing what the early Gothic builders thought suitable for temporary structures, such as those we now have to provide for in London, the Gothic architects of to-day would doubtless have copied these, and not the later ones. Very few such precedents exist, and, for the most part, few ever did exist: since in Mediæval times not one in a hundred of the special requirements of our age had any place at all. The right and consistent course for architects who adopt Early Gothic as their style for permanent works would clearly be to devise another phase of that style for temporary and subordinate works. But while architects are, unhappily, all separated, with every man's hand against his brother, it is out of the question to devise either styles or phases of style. Styles, of necessity, have to be devised by a multitude of artists working together; and all that an isolated artist can do is to work with all the power he has in such styles as already exist. Hence, it will not do to blame too much the isolated artists of our day, because, when prevented by their isolation from developing the phase of Gothic which is wanting, they have fallen back on a phase of mongrel Classic. It is a way of building adapted for ordinary, half-temporary uses, and that is its strength; but it is also a way which harmonises ill with the higher phases of either Gothic or Classic, and that is its weakness. We may, therefore, be said to have once more, as of old, two style-phases, the monumental and the temporary, the poetical and the prosaic; but the misfortune is that the two do not now, as they did and should, harmonise together. Hence we speak of the want having been only half-met, the problem only half-solved, the necessities of the two style-phases only half-recognised as yet.

Another weakness of this revived semi-Classic is, that it does not really know how to deal with any materials but brick and wood. The North and West of England, the great freestone and rubble-stone districts, can, as it stands, hardly turn it to any account. No doubt some architects will get over the difficulty by building in Yorkshire, for instance, just as they would build in London. A man who cannot adapt his ideas to the materials at hand has nothing for it but to adapt the materials to his ideas, and may save himself the trouble of thinking how to make the best of local conditions by putting his client to the expense of bringing bricks and tiles from a distance. This, however, even apart from the doubtful honesty of it, will seldom give satisfactory results. One great charm of good architecture is, that it seems to grow out of its site, to harmonise with its surroundings, to be a part of Nature; and this a brick building in a stone country very rarely seems to be. In the midst of a large town it may pass, for the surroundings then are artificial; but in the country, with rocks and quarries about it, and flagstones, it may be, peering through the turf at its base, the absurdity of importing bricks is a little too glaring. The architects in our stone districts are, however, more fortunate than their contemporaries elsewhere. They have already, if they would have the wisdom to use it, a domestic style far more in harmony with monumental Gothic than is the semi-Classic of 17th-century London. In those districts Gothic traditions have hardly, even yet, quite died out; and we may see what the later Mediæval builders, at least, were accustomed to work in as their everyday style. This, no doubt, needs modification; it is far enough from being a ready-made solution of all our modern difficulties, or a complete model for the cheapest and most temporary of modern structures. But it comes nearer to this than any, save a very few, of those examples in the brick and wood district of England which show a similar amount of Mediæval feeling. The semi-Classic revival, therefore, has no right to spread into places that can so well do without it, and that indeed can so ill do with it. It is a makeshift which we in London may be pardoned for availing ourselves of till we can find or develop something better, but one which we should be far from thrusting on others who have already the germ of a "prose style" incomparably superior. Yet there can hardly be a more palpable or lamentable proof of the helplessness of isolated artists in the matter of building-style, than this very confession. When the same Gothic types are followed for monumental works all over the kingdom, we are driven to advocate as the best thing possible, under the circumstances, the adoption of two other quite distinct styles for temporary and everyday works—one for brick districts, and another for stone ones; and we are driven to this because experience has shown that architects, while they are isolated, may work fairly in old styles, but are almost powerless in devising new ones. Still, as nothing is quite perfect in this world, the present isolation of architects is not absolute and complete; and the measure by which it falls short of being so, is the measure of what can be done in

modifying and giving vitality to the revived semi-Classic. Such mutual helpfulness as there is goes on chiefly through the agency of the professional journals, by which every architect can see what almost every other architect has contributed from time to time towards the solution of the problems which all are concerned with. The Association lectures and the Institute papers have their value,—though the latter society seems to become more and more a business one, and to have few very brilliant suggestions to offer, even from a business point of view. But, after all, the way to study art is to look at it and work at it—not to talk about it and hear about it; and thus illustrations, as being by a long stage nearer to the realities than mere descriptions are, will always take decided precedence of them. So, by one means and another, the revived semi-Classic of our day does show some slight departure almost everywhere from its original form. A modern "Queen Anne" house differs perceptibly enough in most cases from anything that was done in the reign of Queen Anne or her predecessors, and it differs very often in the right direction. Indeed, the final merit which we refer to in the style in question is its great and almost unexampled fitness for modification. Architects may well hesitate to touch the perfect Gothic, or the perfect Greek, by way of alteration; and almost every minor style has a sort of organic oneness about it which makes successful interpolations difficult. It is the crowning glory of the revived semi-Classic, on the other hand, that no one need despair of making it better. Its detail can hardly be worse, and so far it is emphatically the "*corpus vile*" on which, as we have all been taught, experiments should be made.

THE WEATHER AND THE BUILDERS.

THE recent severity of the weather has not only stopped building operations, but put to a severe test the capabilities of those contrivances upon which the art of good building depends. The contractor who has undertaken to complete work has been obliged to take advantage of the clause in his contract which suspends the operation of penalties for non-completion on account of the inclemency of the weather, if he has not already become a loser by the external forces he has had to contend against, causing dislocated walls, fractured stonework, the destruction of mortar-joints and plastering, burst pipes, and a variety of other disturbances. The check to building operations which have only advanced so far as to be still in the hands of the bricklayer is serious enough to create some apprehension in the minds of those who have taken contracts at a low price, though, if the lesson of care and caution is heeded which such a check brings with it, the unusual stress of weather has not been without a salutary effect. But a severe season has a far more reaching application, especially to the large section of the public who build and occupy new houses. It becomes an exacting test of material and workmanship. Even the most substantially-built house must have suffered in some form or another. We are afraid to contemplate the results of the frost and driving snow in the case of the many thousands of new houses which have recently been built and occupied, and especially when the frost abated and the breaking-up commenced. To begin with the roof, it would be an instructive inquiry to discover the percentage of water-tight roofs when yesterday's thaw began. The roof may generally be taken as a pretty sure test of the quality of the house in other respects, though the best-covered roofs are not invariably exempt from the driving of fine snow between the slates or the consequences of a thaw in a confined gutter. The custom of having parapets, which the builder still clings to, despite its manifest evils, increases the risk of an overflow, and invites the accumulation of snow against the front wall, which forms a good lodgment. When the thaw begins the wall becomes saturated with moisture, and the tenant may have to contend with two forms of evil—the leakage through crevices into his ceiling, and a wall sodden with liquefied snow. The gutters get clogged by the drift, and instead of becoming the channels of discharge are converted into troughs, which fill and become a never-failing source of trouble in snowy weather. The change from Classic to Gothic led to the adoption of a more sensible form of roof which the Queen Anne style of building has retained; but, unhappily, architectural style has been as blind to the necessities of climate, as the more arbitrary mistress Fashion in the matter of women's dress. The idea of a roof which shall throw off the rain and snow beyond the walls is in theory a very easy matter; but somehow the architect, in his endeavour to turn it into a picturesque feature, manages to defeat the main object, either by placing two gabled roofs in awkward proximity, or making flats and gutters, where the principal fall would naturally take place. In not a few roofs the architect has done the very thing the hydraulic engineer would do if he wished to form a catchwater basin or a reservoir. He places a huge dam in the shape of a roof right across a valley formed by the slopes or sides of adjacent roofs, thereby penning up the water, and he carries a blind gutter through the obstruction as a relief. What a makeshift! It is nothing but a contrivance to get over a blunder. One often sees a chimney on an outside wall carried up above a roof. When a snowfall occurs a mass of it rests against the chimney, soaking into the warm brickwork and finding its way down appears as damp spots in the ceiling of the bedroom below. The remedy for this is unquestionably a small steep roof with ridge constructed across the angle, the sides of which would throw off the snow on either side. An ordinary gutter is seldom efficient. The ridge connecting the stack with the main roof also helps to support and steady the former. In a letter to the *Times* last week, Mr. Latimer Clark makes a very useful suggestion to prevent melted snow from overflowing the gutters and flooding the rooms below. It is briefly to place inverted troughs of wood or iron, or a simple V-shaped trough with apex upwards along the gutters, so that when the snow melts the water is freely conducted away by the gutters.

We hear of numerous instances of the penetrability of the fine drift-snow of the recent storm, and of many roofs in the metropolis and elsewhere it has found its ways through. Buildings with steep Mansard roofs and parapets have suffered to a great extent owing to the choking up of the gutters, though the least desirable angle seems to be that which is flat enough to afford a resting place for large masses before they begin to slide off, and the wind has more chances of raising the slates of flat roofs. The suggestion of covering the gutters by two inclined boards leaning together at the top is a good temporary remedy; but we might ask why builders do not provide some more permanent form of protection over gutters, into which a large surface of roofing discharges? Movable galvanised wire netting that could be taken off in sections, would be an inexpensive and effectual barrier if placed over these channels. It is needless to say that common tile roofs, if too flat, or the tiles are not laid with a close good lap, are very exposed to the drift of fine snow, and we hear of a church recently built in the suburbs, into which the snow has driven between the tiles to such a degree that the aisle is rendered useless. In specifying roofs of this description great care is necessary to obtain truly-made tiles, and to require close-fitting or pointing in the laying; but when architects have the choice of improved tiles such as the Broomhall Company's, and other forms of Italian tiles, it rests with them whether a perfect roof is the result or not. When snow melts it begins to slide down roofs, and in the case of buildings without parapets some inconvenience, if not damage to glass conservatories, may be experienced by avalanches from lofty buildings—a good reason, it seems to us, for a steeply-inclined roof. One suggestion is to arrest masses of snow, by inserting short pieces of galvanised hoop-iron under the slates at intervals, the ends being made to turn upwards.

These observations lead us naturally to a question which has always taxed the ingenuity of architects and plumbers—namely how to render skylights water-tight. It is not too much to say that an effectual skylight is more the concurrence of good workmanship and favourable conditions than design, for a well-planned method of hingeing the lights, and forming well-grooved rafters and water-tight rails may be rendered completely abortive by the carelessness of the joiner or plumber, in fitting or in dressing the lead round the kerb. A wooden skylight is, moreover, subjected to the most trying circumstances. Alternately wet and dry, scorched by a hot sun, or sodden with moisture, few parts of the joiner's work are apt to decay so soon. These conditions require the most seasoned materials; but in actual house-building perhaps less regard is shown, in this respect, than for other more visible specimens of the joiner's work. The consequences are soon apparent. Either the kerbing shrinks, loosening or otherwise cracking the lead, the sashes become warped, and do not closely fit, or the shrinkage of the stiles and rails leave openings which admit rain on every occasion. Natural decay sets in, and completes the work of destruction. The inconveniences and discomforts arising from wooden skylights are chiefly due to the parsimonious manner in which speculative houses are built. Instead of 2in. or 2½in., they are seldom more than 1¼ or 1½in. thick; no capping is provided to cover the joints, no tongues are introduced, and the glazing is imperfectly performed with putty which is constantly giving way through shrinkage. Of course, metal skylights avoid many of the risks to which wood is exposed; but to all skylights there is the objection that the first heavy snowstorm throws the hall, staircase, or landing of the house in darkness, or shuts out the light from any room which is lighted entirely by its aid. During the past week, many of our railway-stations were obliged to be lighted by gas during the day owing to the late snowfall; but in the case of a skylight, surely the skill of the architect or builder might be called upon to devise some outer protection in the form of a steeped-pitched open-metal grating or net, to throw off the snow as soon as it falls without obscuring the light; and it is remarkable that the perversity of the building craft is such that an outer skylight is often of lower pitch than the surrounding roofs.

Of walls, it is unnecessary to say more than that the builder very often renders them damp and cold by adhering to the old-fashioned idea of having solid walls where hollow-constructed ones would be better for every sanitary reason. In stone districts, where good rubble walling can be had and solidity is not grudged, a solid wall may secure all that is required; but it is a miserable stickling for traditional usage to build thin solid walls of porous brick, and afterwards try to stay the inroads moisture and cold produce. With

these observations we pass on to allude to a few of the commoner defects found within the house. That wonderful specimen of human ingenuity, the modern sash window, is by no means an infallible check to driving wind, rain, or even snow, as many of our new houses have found to their cost within the last few days. Here the art of the architect has done really little to abate the evil. When we have no cold air pouring upon our heads in our parlours or studies, we have a deluge of rain that enters, or small heaps of driven snow, which accumulate in the crevices of the sashes, and pile themselves up in the corners of our windows. On the outside of the window the flat sills form shelves for the snow to lodge till small mountains and ridges appear, but these are harmless compared with the deluge of condensed water which greets our eyes after a sudden fall of the outside temperature. It is useless to inquire if we have remedies for these things. As violent snowstorms only happen once or twice in a generation, the modern house-builder does not trouble about the precautions of extra thick sashes, weather-bars, or grooved and tongued stiles. Everyone knows the value of a double window; but it is an item of cost that tenants are not prepared to pay for, so builders and those they build for are content with the usual sash window with its numerous shortcomings. How mercilessly inefficient some of these fittings are has not perhaps been so fully tested till the other day, and it is certainly cruel irony which points to these deficiencies in some of the better buildings of the metropolis, where the skill and experience of the best artificers are supposed to be centred. It is true, indeed, that the modern architect can provide against these things: he can specify close-fitting sashes, grooved and tongued rebates, weather-bars and draught-preventers; yet by the strange coincidence of modern contract work and machine-labour, all the theory, all the workman's care in operating is thrown away. Competition has brought with it the produce of inferior timber-markets and the artlessness of mechanical labour. The most skilled workmanship is baffled by shrinkage of timber, and the most consummate contrivance may be frustrated by ill-judged conversion of timber. There are a score of other minor defects, which a severe frost opens up. The plumber and the builder are now busy in arresting the flow of water caused by the bursting of pipes, in patching up roofs, gutters, and skylights. In view of the present breaking-up of frost, we may call attention to a few useful suggestions made by the writer we have already referred to. Pipes buried in the ground are safe from frost, but where, as in areas, cold passages, &c., they are exposed, the author proposes the very simple precaution of "inserting within the pipe a small thin tube of guttapercha or indiarubber, containing air, sealed at the ends, and extending the whole length of the pipe. It may be held in position at intervals by copper wires brought to the outside at the joints and soldered in with them." The taps of hydrants for watering gardens should be buried 2ft. in the ground, the handle for turning the tap and the delivery pipe being brought up to the surface. Screw-taps are better, as they shut off the water gradually, and avoid the sudden blow caused by the common plug taps. Another hint to prevent the bursting of hot-water boilers is worth remembering, and that is to draw off a quart of water from the boiler before lighting the fire. If this can be done the pipes are not frozen, and the fire may be lighted with safety; but this precaution ought only be a supplementary one to a safety-valve. Builders and architects would earn the respect of their employers and the public if they bestowed a little care and thought on these matters.

SPECIFIC GRAVITY OF BUILDING MATERIALS.

IF we take in our hands equal bulks, a cubic inch for example, of two different solids, such as marble and lead, we at once perceive a great difference in the pressure produced upon each hand, or, as we should say, one cube feels much heavier than the other. There is, in fact, a greater mass of particles of matter condensed in the cube of lead than in the cube of marble, owing to those particles being more closely packed together, so that bulk for bulk lead is heavier than marble. In order to have an exact or scientific method of comparing the densities of various solids, we adopt the weight of an equal bulk of water as the standard unit, and compare all other solid substances with it. Thus, if we find that a cubic inch of lead weighs as much as $11\frac{1}{2}$ cubic inches of water, we call $11\frac{1}{2}$ the "specific gravity" of lead, its density being $11\frac{1}{2}$ times that of water.

The celebrated philosopher, Archimedes, appears to have been the first to have had his attention called to this mode of comparing the densities of different solids. The King of Syracuse having given a certain weight of gold to a workman to make into a crown, he returned him a crown having the full weight of gold delivered to him; but suspicion being afterwards aroused that it had been alloyed with silver, the king referred the matter to Archimedes, who, while cogitating over the problem, happened to notice that when he stepped into a bath full of water a quantity of water *equal in bulk to his own body* flowed over before he could immerse himself. It then occurred to him that, if he immersed a mass of pure gold of equal weight to the crown in a vessel full of water, and observed how much flowed over, and then did the same thing with the crown itself, he would be able to see whether the latter occupied more space than the mass of pure gold, and thus detect the quantity of silver used to alloy it, as gold is nearly twice as heavy as silver for equal bulks, and therefore the crown would be of proportionately greater bulk. The specific gravity then of any solid is its weight as compared with that of an equal bulk of water, distilled water at 60° Fahr. being used as the standard of measurement.

Specific gravities of solids might, no doubt, be determined by making exact cubes, say, 1in. each way, and weighing them against a cubic inch of water, but this would be a troublesome and inexact process, as we often require to know the specific gravity of irregularly-shaped bodies, and it is, moreover, rendered unnecessary by the following hydrostatic law that "a body immersed in a fluid is pressed upwards with a force equal to the weight of the fluid displaced"; from which it follows that if we weigh a heavy body in water, by attaching it to one side of a balance and allowing it to sink in the water, it loses in weight exactly that of an equal bulk of water; so that the weight of the body as taken in air, minus its weight in water, is the weight of an equal bulk of water. If, then, W is the weight of the solid in air, w its weight when immersed in water, we have

$$\text{Specific gravity} = \frac{W}{W - w}$$

We have here supposed the substance to be heavier than water; but in the case of most woods which float in water, in order to find their specific gravities we must attach a heavy material, sufficient to sink the specimen below the surface of the water. Call P the substance whose specific gravity is sought, Q the weight employed to sink it, and let w_1 be the ascertained weight of Q when weighed in water, and w the weight of P + Q in water; then we have—

$$\text{Specific gravity of P} = \frac{W}{W + w_1 - w}$$

To find the specific gravity of a compound or alloy of two metals, we must know the specific gravity and volume of each component; let S and s be the specific gravities, V and v their volumes; then we have—

$$\text{Specific gravity of alloy} = \frac{VS + vs}{V + v}$$

Having thus briefly described the manner in which the specific gravity of any solid body (not soluble in water) can be ascertained, we now propose to consider the subject in its bearing upon the utility of materials used for building purposes. We have seen that the specific gravity of a body varies with its density, or the closeness of its particles to one another; now it has been generally observed that the durability and cohesive strength of materials are in direct proportion to their compactness or density, a heavy stone or one of high specific gravity being usually stronger and more durable, *cæteris paribus*, than a lighter one, in which the specific gravity is low. This arises chiefly from the lighter material being more porous and absorbent than the heavier, and therefore possessing less power of resistance to pressure, as well as being more easily acted on by water getting into its pores, and either dissolving a portion of the substance, or freezing in winter and splitting the stone to pieces by the expansive force developed in converting water into ice.

In selecting a stone for building purposes it is therefore desirable to ascertain its specific gravity, as even a slight variation in two stones of similar chemical composition will often make a great difference in their relative durability. We have a remarkable instance of this in the case of the magnesian limestone employed for the external facing of the Houses of Parliament at Westminster, where the Bolsover stone was first used, which has a specific gravity of 2·43 (water being unity); but the quarries of this stone being worked out, a stone of specific gravity 2·3 from Anstone was substituted, the decay of which, when exposed to weather, was very rapid, as compared with the Bolsover stone, although the chemical composition was almost identically the same in both. The difference of cohesive strength in the two kinds of stone, when subjected to a crushing weight, is also very conspicuous, being in the ratio of 117 : 83. Again, the magnesian limestone from Cadeby, whose specific gravity is 2·0, is very absorbent of water, and possesses a low degree of cohesive strength. There are, however, occasional exceptions to this rule, as the magnesian-limestone of Bramham-moor has a specific gravity only slightly higher than the Cadeby stone, but is much less absorbent than some of higher specific gravity; and is also possessed of considerable cohesive strength.

With regard to sandstones, the same rule may be said generally to hold good where the chemical composition is similar, but as this latter varies considerably in different stones, we cannot always draw correct conclusions merely from a knowledge of their specific gravities. Thus Cragleith-stone, which is nearly pure silica, has great crushing strength, and moderate absorbent power; but Park-spring stone, which has a higher specific gravity, has less cohesive strength, but is at the time less absorbent, the chemical composition of the two being different. Kenton sandstone has also a high specific gravity, but it is very absorbent, and has a low crushing strength, the amount of silica in its composition being much less than in the above-named stones; and Heddon stone, which is much lighter in weight but contains more silica, is much less absorbent, but has a less crushing strength, and its power of resistance to weather is also small. Morley-moor stone, from the neighbourhood of Derby, has a very low specific gravity, accompanied with high absorbent power and but moderate cohesive strength.

In the case of the Oolitic limestones, the

rule which has been laid down will be generally found to hold good, those from Ancaster and Portland, which have high specific gravity, being the least absorbent, strongest, and most durable. The stone from Portland, however, has a higher crushing strength, owing probably to its containing a small proportion of silica, which is absent from the composition of other English oolites. Among the different varieties of Portland stone, the most durable are those which have the highest specific gravity, that obtained from the top bed being heavier, stronger, and more durable than the stone from the lower bed in the same quarry. Bath stone has, generally, a low specific gravity, combined with but moderate crushing-strength, and being highly absorbent, its power of resisting weather is but small. Some kinds of this stone, however, have much greater durability and strength than others, and generally in proportion to their specific gravities. In other limestones which are not oolitic, the rule holds good, the siliceous limestone of Chilmark having a high specific gravity combined with great resistance to crushing, and low absorbent power, which qualities render it a valuable building material where strength and durability are desired.

Metals differ so greatly in character one from another that it is difficult to draw comparisons between their specific gravity and other qualities; thus gold has a very high specific gravity, and is at the same time the most malleable and ductile of metals; it is also possessed of the greatest power of resistance to the action of acids, and is unaltered by exposure for any length of time to atmospheric influences; while on the other hand zinc, which is about one-third of the density of gold, possesses but little ductility, and readily oxidises when exposed to the air. Such comparisons, however, are of little value as between separate metals; it is by comparing different specimens of the same metal that we discover the value of ascertaining their specific gravity. Thus, for example, we find that cast-iron has an average specific gravity of 7·12, and is very brittle, being liable to fracture by a sharp blow, although it will at the same time bear a very great crushing weight; while wrought iron, whose specific gravity averages 7·68, has rather less crushing-strength, but will bear almost any amount of hammering without being fractured.

Again, if we take two different specimens of cast-iron, we shall find that the one possessing the highest specific gravity is invariably the stronger, and this arises from the particles being more closely packed together, as well as from greater uniformity of texture, since castings are very liable to be honeycomed from unequal shrinkage in cooling, which renders them weak and brittle. In some of the cheap castings in iron, a large proportion of carbon is mixed with the metal, which reduces both its strength and specific gravity, rendering it extremely brittle, and almost useless as a building material that is liable to strain of any kind. The way to test the soundness of metallic castings is to take their specific gravity, which might easily be done by weighing them in a tank of water; had this been done in the case of the first great bell (Big Ben), which was cast for the clock-tower at Westminster, the porosity and inequality of the casting would at once have been detected, and the expense of taking down and re-casting the bell might have been saved to the country. It is always found that when columns of iron are cast solid throughout, the centre portion is much less dense and strong than the part nearer the outside, owing to the latter cooling more rapidly than the former; hence it has been found that hollow columns possess greater strength, weight for weight, than solid ones, and in inverse proportion to the thickness of the metal, which is always denser and has a higher specific gravity in thin castings than in thick ones.

Of the various kinds of timber employed for building purposes it may be generally affirmed that those which have a high specific gravity are stronger and more durable than others of a low specific gravity. Thus, if we compare pitch-pine with spruce, we find the former to have nearly twice the specific gravity of the latter, and that both in strength and durability it is also greatly superior. The wood at the centre or "heart" of firs and many other timber-trees has a higher specific gravity than that taken from the outer part of the trunk, being at the same time stronger and less liable to decay when used for building. Timber baulks are often unsound in the middle, and their strength is thereby greatly impaired; the unsoundness is difficult to discover without sawing them in two; but if their specific gravity was taken as they lay in the water or dock and compared with that of a sound piece of wood, the soundness, or otherwise, of the inside would be at once rendered certain, the unsound part having a lower density than the sound part; so that in case the timber was decayed in the middle the specific gravity of the whole beam would be less than that of a sound specimen.

There are many other building-materials to which the rule will apply; thus, if we compare different kinds of brick and roofing slates, we find that those which have the highest specific gravity are the most remarkable for their strength, durability, and non-absorption of water; the softer and lighter qualities being also more readily destroyed by exposure to weather. The strength of cement depends, in a remarkable degree, on its weight, Portland cement weighing only 106lb. per bushel being found to have little more than half the tensile strength of cement whose weight is 130lb. The adulteration of white-lead used by painters can be detected by its weight, as the materials mixed with it are generally of lower specific gravity. Many other examples might be adduced; but we think that enough has been said to prove that, in selecting materials for building purposes, a great deal more attention should be paid than is usually done to the question of their specific gravity.

ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of this association was held on Friday evening, the President, Mr. E. C. Lee, in the chair. Messrs. Edward W. Smith, F. Kenyon Parker, Arthur Smyth, and H. W. Simpson were elected as members. Mr. Eales, assistant-secretary, announced that the first visit of the session would take place on Saturday (to-morrow) the 29th inst., and would be made to the Standard Assurance Offices, King William-street, E.C.

THE "S.P.A.B." ON ITS DEFENCE.

The following letter was read by Mr. PAGE, hon. secretary:—

The Society for the Protection of Ancient Buildings,
9, Buckingham-street, Jan. 21st., 1881.

To the Hon. Secs. of the Architectural Association.

DEAR SIRS,—The attention of the Committee of this Society having been called to some remarks made by one of the speakers in the discussion that took place on the paper by Mr. Pink, of the 7th inst., I am desired to ask you to be good enough to read this letter at the next meeting of the Associati on. The Society has made efforts for the preservation of many of the churches of Norfolk, amongst others of North Walsham, and of St. Peter Mancroft, and St. George, Tombland, Norwich, besides having issued a pamphlet on "Restoration in East Anglia," a copy of which is enclosed. The Society is now occupied in endeavouring to procure the repair of Knapton Church. It recently drew the attention of the restoration committee at North Walsham to the nave roof of the church, and appealed to it to retain as much as possible of the remarkable and unique old roof, instead of wholly replacing it by a modern imitation. The Society has, from time to time for a lengthened period, directed its efforts against the work done at St. Alban's Abbey, and it opposed the granting of the faculty recently applied for for the restoration of the west front. In face, however, of the local approbation of the proposed restoration, its opposition was futile, and no further action seems now possible. The committee thinks that the same publicity should be given to this statement as to the remarks of the speaker referred to, which were, of course, made in ignorance of the proceedings of the Society. This will be gained if you will kindly read this letter to your meeting.—Yours faithfully (on behalf of the Society),

CHAS. G. VINALL, Hon. Sec.

PROPOSED VISIT TO ROME.

Mr. T. BLASHILL said he believed many architects and students, young and old, would like to hear of a good opportunity of visiting Rome, and he therefore mentioned that this spring an excursion would leave Paris a week before Easter, and return to Paris a week after Easter, stopping six days in Rome, two at Florence, and about one day each at Turin, Genoa, and Pisa. This would involve 17 days' absence from London, but of these 9 only were full working days. He went with two pupils last year, and now offered a few of the leading particulars about the excursion. The total outlay, travelling 2nd class, between Paris and Rome, and placing all arrangements in the latter city in the hands of recognised excursion agents, varied from £21 10s. to £25 15s., but a margin would be needed for extras, chiefly to be expended upon photographs. Low as these figures were, the arrangements were neither low nor insufficient, and a well-known sculptor and archæologist conducted the English section of the party in a manner quite equal to that with which our own archæological and architectural excursions had made us familiar. The advantages to be derived from such an excursion were very great, especially to anyone engaged in the study of Classical architecture. Six days in Rome, at the best a short time, was enough to enable a student to gain great insight into the examples of ancient art there displayed, and would give new value to all illustrations met with in future years. He suggested to any young men proposing to take part in the excursion to join together, and spend their evening leisure in reading Roman history, and in studying the large number of architectural works now available, and so to prepare themselves for sightseeing.

THE PROPOSED TRAVELLING STUDENTSHIP.

The PRESIDENT said he had a communication to make with reference to the proposal of an A.A. Travelling studentship, broached at the opening *conversazione*, which members would consider of a highly satisfactory character. Originally a very modest view of the situation was taken, and a sum of about £400 was aimed at; the prize sub-committee were entrusted with the duties of drawing up a draft of regulations which had since been submitted to the general committee, who had unanimously approved of it. One of the members of the sub-committee took a very sanguine view of the undertaking, and to him much of the success that had attended their preliminary proceedings was due. While some doubted whether the money could be raised, and recommended that a general appeal be made to the profession, and that the members be urged to canvass all their friends, he strongly supported the idea that the Association had power and energy enough to be self-ruling, and that the members could and would, if properly approached, raise a sufficient sum. He must here reveal that this sanguine member was no other than the hon. secretary of the sub-committe, Mr. Aston Webb. The report of the sub-committee would have been before the members this evening but for an unforeseen and very gratifying circumstance—namely, that although only about a hundred members and former members had subscribed, the sum originally proposed had been more than promised, and they would; therefore, not only be able to send out a student this year, but had determined, in order that the remaining seven-eighths of the members might have an opportunity of joining in the movement, to establish a second studentship. The actual sum provided was £515. Having made an urgent appeal to the general body of members to co-operate in the scheme, assuring them that the modest half-guineas would be equally valued with the larger sums that were given by the senior members, the President concluded by reading the draft conditions. The age of competitors will be limited in the present year to 25, in 1882 to 24, and in 1883 and afterwards the limit of age will be 23. Every candidate must be a member of the Architectural Association. The studentship will be of the value of not less than £20, and the tour of the successful candidate shall extend for at least four weeks. The drawings are to be submitted in competition by the first Friday in

May in each year, and consist of:—One drawing from the round (shaded); three sketches from existing buildings (or portions thereof); six sheets of measured drawings from buildings erected prior to the year 1750, drawn to a ½in. scale, with at least one sheet of full-sized details, on sheets of paper not exceeding imperial size. Should these conditions not be adhered to by the candidate, he will be disqualified. The student, prior to the commencement of his tour, shall receive the sum of £10, and should the judges be satisfied with the work executed by the student when on his tour, a further payment of £10 will be made, and a bronze medal presented to him at the annual *conversazione*.

PARSONAGES.

Mr. LACY W. RIDGE, diocesan architect for Sussex, read a paper upon this subject, premising that much of what he should say would be just as applicable to houses for gentlemen of small means as to parsonages. He proposed to speak of country parsonages standing in their own grounds; although much might be applicable to town parsonages, it was obvious that on confined sites, with a party-wall on either side, many features of the ideal building must be dispensed with. Parsonages differed from other houses not in essence, but in the accidents which surrounded them. These might be classified under two heads—tenure, and sources of funds for erection. As to the former point, it was necessary to remember that the parsonage and glebe belonged to the incumbent in right of his benefice, not as a trustee, but absolutely. Although the incumbent had power to build, enlarge, or otherwise improve the benefice at his own expense, or out of funds placed at his disposal, there were so many points on which the consent of the bishop and the patron were required that it was desirable, before beginning to build, to apprise them of the fact. On no point were they more likely to be anxious than that the buildings should be approximate to the benefice, and it was specially necessary, in view of possible future tenants, not to over-build the income derivable from the incumbency. Still, a good house, if in a pleasant district, attracted men of independent means, to the undoubted advantage of the parish. The greatest delinquents amongst the building clergy were those who added as much as possible to the outbuildings, regardless of quality of materials and soundness of construction, if they would outlast their own day. In building for a bachelor, or a man whose immediate requirements are small, or whose funds are limited, it was only right to remember that each new incumbent, or even the present one, might want to enlarge. If, therefore, space could be furnished in roofs which might hereafter be converted into attics, or could otherwise prepare for contingencies, it would be well. The funds available should be expended in making the house as commodious as possible, leaving it for future time to add bays, porches, and similar features. In some instances the lecturer had gone so far as to put in the girders for the openings into the future bays. At Eartham, for example [see illustration], the attic-roofs were laid, or, rather, the ceiling-joists of first-floor were strong enough to act as floor-joists. As an incumbent was landlord as well as tenant, he was liable for substantial repairs, no allowance being made for wear; and, if necessity arose, even for rebuilding. The workmanship should therefore be thoroughly sound and good, beauty should be achieved by good outline and proportion, and there must be an absence of ornamental features and architectural frivolities. The courts having held that internal papering and painting were merely decorative, the former might be omitted from the building-contract; but as to painting, he had never yet found anyone strong-minded enough to follow the decision to its logical conclusion, and leave internal work without its equivalent staining and varnishing. Aviaries, observatories, conservatories, &c., should not be included in works to be executed with funds supplied from a public source. Having referred to the speciality which affected parsonage-building, owing to the sources whence the funds were supplied, namely, the patron, public subscription, the Ecclesiastical Commissioners, the governors, Queen Anne's bounty, and lastly, the clergy who inhabit, Mr. Ridge remarked that he knew of but one complete Mediæval parsonage. This was at West Dean, situate in a hollow of the South Downs, near Eastbourne. It was now used as a cottage, and was a long two-story building, with two-light windows, having rebates for casements or shutters, a charming stack, and circular staircase. It was illustrated in Turner and Parker's "Domestic Gothic," and in the *Transactions* of the Sussex Archæological Society. In a large proportion of old Sussex livings was to be found, either standing alone or built into and incorporated with the house, a timber-built cottage with solid oak beams, a great central chimney stack, lead-light casements, brick-nogged or plastered panels, sometimes weather-tiled on the upper part, two-story in height at the front, and one end with a high-pitched roof running down to within a foot or two of the ground at the back and other end. The plan consisted simply of three or four rooms on each floor leading out from one another. The lowness of the stories and the insufficient height of the doors rendered it necessary for a modern man to take heed to his ways as he walked about therein. Such were the humble abodes of the mass of the country clergy 200 years ago. Since that time parsonages had passed through every form taken by other houses. It was at a more recent period discovered that the old timbers exceeded the necessary scantling in size, so fir was introduced of dimensions terribly attenuated. Slates were a great invention, and might be put at so much lower pitch than tiles, so on they went at an angle of 30° or less; but the south-west wind had since driven the rain right through. Then came the Gothic revival, when every room was gabled, and an accumulation of gutters and snow-stores created marvellous to behold, and terrible to keep clear and in repair, while to suffer patiently all the evils arising from casements and small lights might almost be regarded as the special form of martyrdom—not so severe, perhaps, but far more lasting than that now in vogue—by which the parsonage-building clergy of that day proved their orthodoxy. Common-sense, double-hung sashes, and, to some extent, Queen Anne (not in this case the Bountiful lady of Dean's-yard) had advanced the art some stages further, while the old weather-tiled timber house had asserted a considerable artistic influence in all parts of the country where brick and tile, rather than stone and slate, were the natural building materials. Never before were architects so free from the tyranny of style and prejudice, and so able to satisfy, in accordance with the dictates of common-sense, any definite requirements such as those issued by the Ecclesiastical Commissioners, to which he would proceed to call attention in detail. Even where architects did not need to obtain the Commissioners' consent to their drawings, they need hardly neglect the particulars issued by them, even if it were only to coerce a possibly self-willed client into the right way. He had Mr. Ewan Christian's authority for announcing that that gentleman, as architect to the Ecclesiastical Commissioners, was always ready to look over when in pencil, any drawings which were to be submitted to him. He would say to those who accepted this privilege—show the points of the compass on your plan, and look after your aspects; until you have satisfied Mr. Christian that you have obtained all the sunshine and cheerfulness that the site is capable of affording, you will have a bad time of it. The Commissioners, added Mr. Ridge, suggest the provision of two sitting-rooms with the somewhat modest dimensions of 16ft. by 14ft. It is certainly desirable that one room at least should exceed these dimensions, and I am inclined to give preference to the dining-room, as being that best adapted for those meetings of parishioners, and of neighbouring clergy, which constantly occur in parsonages. The dining-room is, as as in fact the commissioners call it, a "sitting-room"—in some cases the family sitting-room. It must be cheerful, with a south-east or southern aspect, and as unlike as possible to the state dining-room, looking north of a gentleman's mansion. The drawing-room, or ladies' room, has no special features in a parsonage. A bay will almost certainly be asked for, as some picturesqueness of plan is much appreciated. It is well to provide a side wall where a conservatory may be placed, and a French casement opening in that direction. The study is a room of considerable importance. It should be free from the disturbing influences of the household: for instance, its fireplace should not be back to back with that of the kitchen. It should be easily accessible for callers, though the kind of parish largely affects the mode in which this is to be provided for. In purely agricultural parishes, with the exception of the squire and a farmer or two, the people will go by preference to the back door. In more populous places the front door will be chiefly used, and a special study-entrance may be provided. As the study should be sacred to professional duty, a small room affords less temptation for domestic incursion; the 14ft. by 12ft. given by the Commissioners is ample. A kitchen and scullery must also be provided. To the five bedrooms, each with a fireplace, should be added at least one dressing-room, with a fireplace, if it may be, and large enough to hold a bed. Where only one dressing-room is provided, it is not a bad arrangement to make it applicable to either of two rooms, so that if guests come who expect that accommodation, it may be given over to them. You should bear definitely in mind which rooms you intend specially for the servants, and, in some cases, the adaptability of certain rooms for day and night nurseries will be discussed and provided for. The Commissioners also ask for pantry and china-closet, larder, water-closet, wine and beer-cellar, coal-house, dust-bin, &c. There should certainly be a pantry, rather than, or in addition to, a china-closet. Where cows are kept a dairy is necessary in the smallest house, and it must be near the back-door. Of water or earth-closets three are generally required—one on the first-floor, on first landing, one for gentlemen's use, either external or on the ground-floor, and one in connection with the servants' offices. As a rule, the two last I provide as earth-closets, wherever there is a garden. The provision of a cellar is much appreciated as an additional store, and also as a summer larder or dairy. Where there is no cellar, Mr. Christian suggests that the wine can be stored in bins under the stairs. Don't excavate a cellar in a damp soil, as a wet cellar is very dangerous to the health of a household. For the coal-place, cleaning-room, and servants' w.c., I have found it a good plan to provide a separate door out of the scullery, with a little covered lobby or yard. In one place, that of Forest-row [see illustration], I have abolished the old scullery back-door and have substituted a door calculated to be of very general use for tradesmen, servants, and parochial callers, as well as being a back-garden door. Where the front door opens into the garden and there are casements in the drawing-room, I hardly consider a special garden entrance necessary. It makes an additional external opening to bolt and bar, and is liable, unless very well managed, to be productive of through draughts, with the consequent slamming of doors. One thing not mentioned by the Ecclesiastical Commissioners, but almost essential, is a back staircase, or, at least, part of one. Where all the sitting-rooms are on the ground-floor, it is sufficient to provide a back staircase to the level of first landing only. An additional room very much valued is a parish-room. This does not mean a small public hall, such as that attached to the church of Whitechapel, or those which some London clergymen have provided; but a rough room, suitable for night schools, choir practices, and similar meetings to which the people will come in their working clothes, a place where mothers' meetings may be held, the parish lending-library kept, soup distributed, blankets served out, and the hundred and one other things done of which a rural parsonage is the centre. It serves for a waiting-room and for interviews with callers of the rougher classes. It should be easily accessible from the parish or back-door, rather than from the front door, and should have good means of ventilation. In the country store-closets are very necessary. A linen closet, near a flue if possible, or containing the tank of a hot-water system, is very desirable, and a clothes cupboard in the servants' bedroom is also useful. A bath-room, while nice, is not, in these days of the morning cold-water tub, a necessity, and the bath and the hot-water system should be provided at the incumbent's personal expense, and remain his property. Cold water should be laid on to first floor, and a housemaid's sink will be necessary. Unless the well is shallow and pumping easy, rain-water should be collected from the roof, and a supply for first-floor provided, the overflow being taken to a tank in the ground. Where you must depend on rain-water, the storage should be ample to cover dry seasons, and in such cases earth-closets have

manifest advantages. The water for kitchen boiler ought to be filtered. When you have a deep well and force-pump, its position is of the greatest importance, and should be fixed before setting out the house. Now as to construction. For warmth and dryness it is desirable to use hollow walls, properly bonded. My usual practice is to have 16in. hollow brick walls on ground-floor, and 9in. brickwork, covered with weather-tiling, on first floor. This has many advantages, beyond the appearance, over 16in. walls carried the whole height; you get a far better bearing for plates, especially those of first floor; there are no difficulties to contend with over the heads of windows; and there is no fear of sound being conducted up the hollow from one floor to the other. At the level of the under side of plate of ground-floor I put the damp-course on the inner face of wall only, carrying the hollow at least 3in. below it. It is best to have the 4in. thickness of brickwork on the outside and the 9in. inwards. At 9in. below first-floor plate build solid; the projection of weather-tiling will keep this dry. From plate-level have 9in. work, which, if the bricks are really square, may be built with bricks on edge in Flemish bond, giving 4½in. courses, into which the plain tiles can be nailed with long galvanised nails having heads. This work will certainly be dry. In suitable positions 11in. hollow walls are permitted. The Commissioners allow battening, but I have seen so much of it old and dilapidated, and of about the strength of a bandbox, that I have the strongest prejudice against it. For your peace of mind, put a damp-course to your chimneys at the junction of stack and roof, stepped up the rakes. Don't lay tiling in the London way; it will not be understood, and lead flashings or tiles dressed down as on slating are useless in the country. Access to roofs and gutters is desirable, not only for general purposes but because parsonages are subject to surveys at not unfrequent intervals. Do not, however, have more central gutters than you can fairly help; no one goes paddling about on a roof without doing harm. My practice is to cover the house with a single roof, broken up and disguised, it may be, with dormers, gables, and hips, starting from a high level on one side, and running down on the other, generally towards the north, to a few feet from the ground, so as to develop the principle of the old cottage parsonages. The requirements of the Governors of Queen Anne's Bounty correspond with those of the Ecclesiastical Commissioners. No paper on Parsonages would be complete that did not treat of the subject of alterations. The Bounty require in such cases an estimate of the value of old materials, which you will have to furnish. Speaking generally, bricks and stones will be reusable, old tiles, when old and sound, are better than new; a few doors may be available, but sashes and frames are seldom worth putting in again. Old oak is very disappointing; men object to work it on account of its extreme hardness and the nails in it. Look carefully for lead. For the rest, the old materials will hardly pay for taking down. It is well to remember that for a given outlay you can get a larger house, with more accommodation, by retaining as much as possible of the old place, than by the popular process with those who have not to find the money of clearing away and building *de novo*. An old house, intelligently altered, is more charming and picturesque than a brand-new one. You lay the plans of the old house down on paper, and then, without prejudice, arising from the uses to which the different parts are now put, con over how best you can bring the place into accord with modern ideas.

The PRESIDENT spoke in high terms of the practical character of the paper, and observed that for country parsonages a good arrangement was to provide a special entrance and lobby leading direct into the study with a bell rung from outside and hung in the room. He called upon

Mr. EWAN CHRISTIAN to open the discussion. He said Mr. Ridge had brought before them the general principles governing a parsonage-house, but there were a few points of detail which had been missed. The great distinction between a parsonage and any other gentleman's house was that, in the former case, you had to build not for the actual occupant, but for all future incumbents, and must provide things suited not for a man of means, but act upon the supposition that the occupant would have simply the income accruing from the benefice; further, the future tenant might be unmarried, or might have a large family, and it was impossible to conjecture how long the present occupant would remain there. In two cases, a parsonage and a palace, it had been his fortune to plan a house for one man, carry it out for a second, and a third inhabited it. In the case of the palace, the first bishop had a grown-up family, and wanted no special provision for their wants; his successor had a family of young children, and required two large nurseries to be provided. This was done, and then the third bishop came, and as his sons and daughters were grown up, he had the building altered back again at his own expense, while still paying off the cost of the previous alterations, from which he derived no benefit. A parsonage must, therefore, be planned and built upon general principles, and perhaps the easiest method of suggesting these would be to tell the members the mental process that he underwent when he looked over the plans of rural parsonages sent to him for examination. The first consideration was the aspect. In order to be healthy, a house must have all the sunlight possible. He had found so much difficulty in persuading architects and their clients to adopt these views that he had put up in his office an Italian proverb he learned from the late Professor Cockerell, "Where the sun does not come the physician does." The view might be good on the north, and the outlook might be on slums or a dead wall on south; but even then he believed the future occupants would prefer to live on the sunny side of the house. Three times in the course of his large practice had he given way to architects or their clients on this point of aspect, and in every case when he had visited the completed building, he had seen that it was a mistake, and that a little ingenuity on the part of the architect would have overcome the difficulty. The economies of the house were too often overlooked. It was the exception for a parson to have two servants, and needless time and labour in cleaning or serving must be avoided. He sometimes saw in a planned room of 16ft. by 14ft. as many as five separate windows—involving not only unnecessary original outlay, and the maintenance of curtains, glass, &c., but much time in cleaning, and extra bolts, bars, and shutters, to be moved twice every day. Long passages were also wasteful. All chimneys should be internal, so as to get the fireplaces in the most useful position, and utilise their heat; external chimneys were only permissible when made as thick and massive as old work of the kind. A house could not be healthy unless the staircase and corridors were warmed, and also provided with plenty of fresh air. Mr. Ridge had advised them to put the 9in. section of a hollow wall inside, and the 4½in. outside. Constructionally this was right, but there was a great practical difficulty; unless the bricks were extraordinarily good, the bond would not be thorough, and hence such a quality of brick would be required that it would be less expensive to build in solid 18in. work. At the same time the hollow space was an excellent non-conductor, and he therefore recommended them to put the 9in. course outside, or, where it could be afforded, to build with two 9in. thicknesses, with an interspace of 3in. In no case should the ties be of iron, which quickly rusted away. Built on either of these pl ns, and with a proper damp-course, a new house would be as dry and warm as most old ones. The drainage of the country parsonages was often a matter of very considerable difficulty, as no general sewerage system existed. Earth-closets were most useful, as they obviated the necessity for a cesspool. When the soil consisted of gravel over clay, the well-water supply would certainly be contaminated if a cesspit of any kind were dug, but if the soil were chalk or clay, over sand, all would be right. It was very important that nothing should be omitted from the plan, as if it were not discovered till the funds were borrowed it might not be completed for many years. He had seen a parsonage where for years there was no path or steps to front door, because this was overlooked in designing. No "fads" desired by a client should be given way to, for reasons he had already mentioned, but there was one which was especially objectionable—that of placing obscured or coloured glass in the upper part of the window, shutting out the best part of the light. He always denounced this abominable practice, and recently saw an instance of this, the design of a member of the Architectural Association, who had built a good many houses, which made him downright savage; he could have taken a hammer, and smashed that stained glass with the greatest pleasure. Again, he had known a country parsonage built with Bath-stone dressings, but in which there was not a single shelf, cupboard, or other fitting, the architect having forgotten or neglected Bacon's observation that men built houses to live in, not to look at. He constantly saw plans for timbered work of pitch-pine, barge-boards, &c., and disapproved of them, because a parson ought not to be burdened with painting every three years and repairing such unnecessary features. Old oak for reusing was worse than useless. It was not only, as Mr. Ridge had said, hard to work, but was almost always worm-eaten, and if laid where it could not be ventilated, would soon go, however sound it might be. He remembered discussing this with the late Sir Gilbert Scott, who replied, "But when you and I were young, 'old oak' was constantly specified." "No," he said, "that was 'old ship timber,' well seasoned by salt water and exposure, and quite a different material."

It being now 10 o'clock, Mr. BLASHILL proposed and Mr. H. W. PRATT seconded a vote of thanks to Mr. Ridge for his paper, and this was carried amid applause, and suitably acknowledged by the lecturer, who also thanked Mr. Christian for coming down that evening and giving them so practical an address.

THE CAPABILITIES OF RENAISSANCE.*

By ANDREW DEWAR.

IT is not, we think, generally remembered in the profession that every style of architecture has gone, and will continue to go, through four stages of existence; stages so little thought of, that we are convinced, were they more so, better work would be done and fewer crudities erected. The first stage, and what may pre-eminently be called the *life* of the style, is that during which it has come into existence, run its course of beauty, vigour, and grandeur, and died in the coldness and stiffness of a wearied old age. The second is the Renaissance, or new birth, when all the vigour of the old life is coursing through the veins of youthful enthusiastic giants, developing new forms and running riot in ornamentation, but whose hands are not yet softened to the delicacy of touch, nor minds trained to the cunning of the masters from whom they are learning. The third is the revival, where the young life of the Renaissance has lost its fire and foot-ruled itself to a correct but despicable copyism. And the last is the sepulchral or dead stage, when life, life-like studies, and even correct copyism are gone, and only gaunt skeletons grow into the air, freezing all art and feeling with their deadly stony stare.

The stage we have mainly to deal with to-night is the second, and while the subject is supposed to treat more particularly of the Renaissance of the Roman style, we think it will be to the purpose in this age of turmoil in architectural styles not to exclude from our consideration Renaissance as a whole.

It is scarcely necessary to tell an architectural association what Roman Renaissance is, and yet, if we may judge from the works of many who practise the style, it is a word without meaning. Renaissance, in most dictionaries, is said to be *revival*; this is apt to lead astray, for the correct meaning is new birth, and the term was applied in the first instance to the resuscitation of Classical learning in the fourteenth century, and thereafter to the new birth of the Roman style of architecture. This took place first in Italy, and gradually spread over all the civilised nations of Europe, each nation, as it copied the new-born architecture, impressing its own stamp upon it, so that now we have not only English Renaissance, but Italian, French, German, Spanish, and even Russian. Its influence has thus been boundless in Europe, showing that it contains the germs of a nobility which meets the aspirations of the most varied intellects of the civilised world. At the beginning of the Renaissance considerable fertility of design was displayed and picturesque combinations of Gothic forms and features in Classic dress showed how those early giants, such as Brunelleschi and Alberti, were feeling their

* Paper read, Jan. 19, before the Edinburgh Architectural Association.

way; and besides, it indicated as a finger-post of art the new road architecture was treading; but, unfortunately, when the climax of Italian Renaissance was reached in the erection of St. Peter's, the tide of mere copyism set in, and with a Palladio and a Vignola to mould the art by foot-rule and scale, architecture in Italy died, nor seems in any hurry for a resurrection.

When Roman art and the Empire died in arms, architecture was in infancy; every structure in its almost severe simplicity of form betokened the influence of Egyptian immortality and Grecian culture. While the bases and shafts of columns were broad enough to balance eternity, the capitals, friezes, and panels were worthy to be wrought in gold. Such a feature as a dome carried on pillars and hung in air was never planned, and spires were a flight above their grovelling religion. 'Tis true they built the Pantheon—and well deserved he immortality who conceived it, with its vast span and one almost poetic eye in its zenith, guiltless of glass, or frame, or bar, across which the white clouds flit in their depth of blue, while the rain and the sunshire poured in together; but Brunelleschi, when he lifted this down and balanced it upon his lofty pillars, so that Florence, far and near, should see the Pagan temple purified by Christianity, and swung into the heavens to show them where their thoughts and aspirations lay, accomplished a work than which there is not a more glorious in the whole story of art. Therein lay the true Renaissance, the true new birth of a style. Not the fashionably-clad skeleton of polished bones and grinning teeth, not the scarecrow of a thing that never had life, with a brand-new suit of a dead man's clothes, but the living body itself resurrected, with flesh and blood, with fire in the eye and strength in the muscle, and having on a garment that never grows old. Not the rigid standard of size, the equal balance of parts, the reduplication of form and idea, each moulding and projection labelled to the inviolable part of a module, so that the fear of inexactness freezes the heart of the most imaginative mind, but a form which changes with every purpose, a variety still consistent with harmony, projections as they are required for shadow or shade, and the ornament expressing all feeling and sentiment, showing nature in every variety of mood, and imbuing the undying front with such a picture of the times that like, an ever-open page of history, whoever runs may read.

Thus, we say, did the first Renaissance commence, and had it continued, would have been living still? But its history is the history of all styles, from Egyptian to Queen Anne; glory and decay are common to each. Art but resembles life in all its forms, and death comes sooner or later to both, so that the most we can do is to give longevity to that which is best, for the pantomime invariably comes in at the end of the circus.

In the Italian Renaissance we have said with St. Peter's commenced the decline of the style, for the idea of a dome was not new, and a vulgar struggle after mere size and bigness took the place of that search after new forms and new adaptations of an old style to changed requirements and altered conditions which had characterised the works of the preceding architects. With this lack of invention naturally commenced an increase of mere polishing. Kid gloves succeeded horny hands. Work was cleaner done, mouldings better shaped, ornament more regular, and planning more formal. Manner succeeded matter, ceremony succeeded sentiment, affectation supplanted feeling, and regularity superseded beauty.

It is interesting to trace this degeneracy from life into formalism in ornament, and no study will more richly repay the architect, or even mere lover of art, than a searching examination of the sculpture, carving, and ornament of the different periods of a style. As this is cognate to our subject, a sketch of it will not be amiss here. The idea was brought forcibly to our notice while sketching, more particularly the sculpture of the Gothic churches of England and Italy.

In the earliest carving we have, as a rule, very rough workmanship, but no mistake in the intention of the sculptor; his meaning, however rude his method, is brought out in startling relief. What a man said he meant in those days, and a spade was called a spade, under all circumstances. Thus, in St. Mark's, Venice, a sculptor wishes to tell you of John the Baptist, and he depicts him trying to fish his head out of a tub. Judas is hanging with a rope round his neck, and a purse in his hand. In the porch the whole story of the Creation and the Deluge is worked in mosaic; and Eve, in one, after eating the apple, is shown hurriedly putting on a garment, while Adam is looking most uncomfortable in a stiff nightshirt. In St. Zeno, Verona, two uncouth figures are being driven out of a garden, and as both are trying to hide their nakedness with a huge cabbage-leaf—not a dainty fig leaf, which only makes nudity more conspicuous*—no doubt is felt as to whom they are meant to represent.

Adam and Eve is indeed a favourite subject with all the old carvers. A peculiar one in Beverley Minster shows the pair beside the Tree of Knowledge; Eve has eaten the apple, and looks decidedly jolly, while she proffers a bite to Adam; but the worser half, finger in mouth, seems to doubt the propriety of the feast. A startlingly realistic group, on the centre door of Notre Dame, Paris, shows an angel holding the scales, in which a praying saint and a sinner are being weighed. The saint overbalances the scale, and thus the sinner is found wanting, although the Devil himself, with hands on beam and scale, is striving to bear it down. A smaller devil also reaches from the burning brimstone, with a crooked bar, and bends his energies to the hopeless task, but all in vain. Here, a lesson taught to all mankind, the carver's rude chisel-marks being, without doubt, of more meaning to the godless of Paris, than the sermons of five centuries of preachers.

As evidencing in a peculiar manner the ubiquity of the Gothic style, and the ties which in those distant ages linked together countries so far apart, we may mention a group met with no less than five times in four different nationalities—The Creation of Eve. The first place we observed it was at Roslin Chapel. On an old oak chest in the crypt may be seen a most graphic and realistic bas-relief of this most interesting episode of our history. Adam is asleep and lying on his side, head on hand. The Deity, in pontifical robes and tiara, is kneeling down, and lifting Eve bodily out of Adam's side, while the effulgent sun and crescent moon, each fashioned into a face, smile complacently on the portentous event. At Beverley we were amazed to find the same group slightly altered, the Deity standing, with monk's robes but no tiara, and Eve floating gracefully into the air, all but her feet out. Travelling southwards, we next encountered the same scene at Sainte Chapelle, Paris, rendered lifeless, however, by a modern restorer, and the sculptor, whether first or second was not very clear, had perpetrated the anachronism of providing Adam with a fig-leaf! We next saw it at Orvieto, and last at St. Zeno, Verona, which probably is the original of all the others, as the church dates from the 12th century.

Numerous other instances might be multiplied of the life and history conveyed by those early Gothic carvings; but our point at present is to show that as the sculptures grew more perfect, the stories told became fewer, the attitudes more formal, and the meaning more vague. From bas-reliefs on plain panels the figures grew more and more relieved, until they stood first in niches and then on the apexes of gables and pinnacles, when they were lost in the clouds.

In the revival of Gothic in our own times, we would expect an evidence of the progress of the world's culture in the carving exhibited; but what see we? Where sculpture is attempted, a king and queen's head terminates the label of an entrance porch. Why they have been so decapitated; whether emblematical of a monarchy or a republic; whether there as Defenders of the Faith, or gibbeted for their misdeeds, nobody knows, and nobody ever pretends to know; nor is our disgust allayed when we are aware the same thing is repeated tens of thousands of times over the length and breadth of the land. But we have made greater progress than this, to do ourselves justice. We have, in Edinburgh, a brand-new cathedral, by one of the greatest architects of the 19th century, and on this, if anywhere, should examples of our progress in carving in 600 years be found. Contrast, therefore, with the sermon on Notre Dame the west doorway of St. Mary's. Over the entrance a central sitting figure holds a key in one hand, and a lamb in the other—nothing wonderfully original in either idea, or conveying any decided meaning. John the Baptist is on one side—why not Peter?—he got the key; and a man prays on the other—but what for? The whole combination has only been half thought out; but the paucity of imagination is most strikingly displayed when we examine the rest of the doorway, decorated merely with copies from York, Beverley, and Ely, of all sorts of monsters growing out of, and intertwined with foliage. These monsters have no meaning in this enlightened age. The days of ghosts and ogres are gone. Once upon a time this *delirium tremens* of religion was a terrible reality; but when Sir Gilbert Scott expected to frighten the fashionable west-end inhabitants of Edinburgh with such bogies, he certainly was not flattering the intelligence of our learned metropolis; still such may be, notwithstanding, a correct Cockney notion of Scottish culture. While not profuse in the exterior decoration of St. Mary's, enough has been lavished on a useless zigzag enrichment on the interior clerestory windows to have carved the whole of the "Sermon on the Mount."

(To be continued.)

* A ridiculous example of this is seen in the Vatican, where some squeamish Pope had contracted for bushels of stucco figleaves, and had them plastered over every nude figure indiscriminately—man, woman and child.

COMPETITIONS.

FOREST HILL.—We hear there are five sets of designs submitted for the proposed new church of St. Paul's, Forest-hill, and that a committee-meeting was held last Wednesday evening to take them into consideration and to make a selection. We are glad it is proposed to obtain the opinion of a professional architect of eminence upon them. An excellent site upon rising ground in the rear of the present temporary church has been selected, and the sum fixed upon by the Committee is £6,000 without a spire, though a few of the designs would exceed this sum.

PONTEFRACT TOWN-HALL SCHEME.—The town-hall committee of the corporation, under the presidency of the Mayor, met on Monday evening for the purpose of opening the seals of the authors of the numerous designs for the additions to the above. The author of the selected plans, "Straight and True," is Mr. Perkins, of Leeds, and he will be intrusted to carry out the work. The second selected design, "1880," is the work of Messrs. Roper and Brown, of Manchester.

CHIPS.

At the Carlisle Consistory Court, held on Wednesday week, plans were produced, and a faculty granted for the addition of a south aisle, 60ft. by 20ft., north porch, and heating chamber, and the rebuilding of the vestry at St. John's Church, Keswick. Mr. Watson, of Penrith, is the architect, and the cost is estimated at £1,300.

The Guildford town-council last week discussed the question of sewering the town, and eventually referred the matter to a special committee. It was stated that Mr. R. Rawlinson, C.B., had expressed an opinion that the town could be well sewered for £12,000.

A three-light window at the west end of south aisle of Halifax parish-church is being fitted with stained glass as a memorial to the late Archdeacon Musgrave, 48 years vicar of the parish. Messrs. Hardman, of Birmingham and London, are carrying out the work.

A new Congregational church has just been commenced at Chiswick. Mr. Brunsden is the contractor.

Mr. Henry Bruce Joy has just completed a statue of the late Lord Chief Justice (of Ireland) Whiteside, which is to be placed in St. Patrick's Cathedral, Dublin. It is executed in marble, and represents the chief justice in a sitting attitude arrayed in his full robes.

The apse of Albury parish-church, Surrey, has just been fitted with sumptuous hangings of velvet and silk, having a gold ground with pomegranate figuring and narrower bands of claret, green, and gold. The hangings were made and presented by Lady Rokewood Gage.

At the meeting of the Wimbledon Local Board held last week, one of the members moved that as the opinion of the board was at variance with that of the surveyor, Mr. Mason, on the drainage and other matters, he be given the usual three months' notice. This having been seconded, an acrimonious personal discussion took place, in the course of which it transpired that the clerk to the board had written a private letter to Mr. Mason, urging him to resign. The subject was eventually referred to a committee of the whole board.

ILLUSTRATIONS.

ROYAL ACADEMY PRIZE MEDAL DRAWING OF ENTRANCE TO CHAPTER-HOUSE, WESTMINSTER.—SUSSEX PARSONAGES.—GOTHIC CHAMBER IN THE LIMES, DULWICH.

OUR LITHOGRAPHIC ILLUSTRATIONS.

WESTMINSTER ABBEY.—THE ENTRANCE TO THE CHAPTER-HOUSE.

FOR the detail drawings from Westminster Abbey, which we have reproduced to-day, Mr. M. Allen received the Royal Academy "First Silver Medal for Measured Drawings" for 1880. The double-page plate furnishes a front elevation as well as a section of the entrance to the Chapter House, and the single-page sheet includes the elevation as seen from the passage-lobby, and also a longitudinal section (looking south) of the passage between the Chapter-house and the cloister. All the stone joints are put in from actual measurement, and the sizes in figures are also furnished on the plates. The subject thus illustrated is so well known as to need little description on the present occasion. A review of all the drawings submitted in competition for the R.A. medals and prizes was published in the BUILDING NEWS for Dec. 17 last year.

SUSSEX PARSONAGES.

OUR first double-page plate to-day includes the plans and exterior views of four Sussex parsonages, which have lately been erected, from the designs, and under the supervision, of Mr. Lacy W. Ridge, F.R.I.B.A., and who is also diocesan surveyor to Chichester. We have chosen these drawings in order to practically illustrate Mr. Ridge's lecture on "Country Parsonages," which was delivered last Friday before the Architectural Association, and reported by us to-day on page 92. The buildings illustrated are Eartham Vicarage, East Wittering Rectory, Bishopstone Vicarage, and Forest-row Vicarage. The plans in each case are all carefully figured, and little, therefore, need be said by way of detailed description beyond a reference here to the report which we give of the lecture.

GOTHIC CHAMBER AT THE "LIMES," DULWICH.

ONE of the most picturesque interior drawings of domestic decoration this year at the Royal Academy was that which we publish to-day, showing the "Gothic Chamber," as it is called, lately completed at "The Limes," Dulwich, from the designs of Mr. Theodore A. Howard, architect, of Berners-street, W. An interesting feature in the design is the "upper chamber," or retreat, over the fireplace, and which is reached by a quaintly-contrived lobby and staircase. The style chosen for the entire work and furnishings, and hence the name of the apartment, is Gothic. As an example of this style, the illustration cannot fail to be interesting at the present time, when other styles are generally thought more suitable.

A block of county police buildings has just been erected in Church-street, Oldbury. The front elevation is of red bricks with Bath-stone dressings. Mr. Henry Rowe, county surveyor for Worcestershire, was the architect, and Mr. G. H. Marshall, of West Smethwick, the contractor.

HOUSE-DRAINAGE, SEWERAGE, AND VENTILATION.

A PAPER upon these subjects was read before the Society of Civil and Mechanical Engineers by Mr. Reginald Middleton, on Thursday night. The author pointed out that in house-drainage sewage matter should be removed as soon as possible and entirely, so that there may be no fermentation, and that when it has left the house there should be no return of the gases evolved from it. To effect this it is necessary that all pipes should be air and watertight; that the drains should be laid, if possible, outside the houses and in straight lines both as regards direction and gradient; that they should be free from the walls, so that settlement of the foundations may not affect them, and that they should be easily accessible. No connection should be made with the drain inside the walls of the house, and a disconnecting and ventilating chamber, protected by a siphon trap, should be introduced between the drain and the street-sewer. The closets should be placed outside the main walls of the house, and should be ventilated, the soil-pipe should be outside the house altogether, and should be carried of its full diameter to a point above the roof and not near either windows or chimneys. The pan closet and ⊃ trap should be done away with, and an apparatus used free from angles and without space for the evolution of gas. The waste-pipes from cisterns, and safes of baths and closets, should be carried into the open air and no further, so that they may act as detectors. The discharge-pipes from sinks, baths, and lavatories should be entirely disconnected from the main drain or soil-pipe, and should deliver in the open air on to the gratings of stoneware siphon gullies, which, again, should discharge into a manhole on the main drain. No trap of any sort in direct connection with the main drain should be placed inside the house. The drain should be ventilated from the siphon rear, the sewer to its extremity. Many cowls and other mechanical contrivances have been devised for increasing ventilation; but, in the opinion of the author, they either fail when most wanted or are unnecessary. Cisterns should not be made of lead, but preferably of galvanised iron; they should be carefully covered in and easily accessible, and frequently cleansed. There should be separate cisterns provided for flushing closets, and it should be impossible to draw any water from these except for that purpose. No cisterns used for dietetic purposes, or for anything but the flushing of the closets, should have any connection whatever with any drain, trap, or soil-pipe. The main drain must be laid to such a gradient that it will be self-cleansing. When such a drain goes under a house, which cannot always be avoided, the best material to be used is cast iron jointed with tarred spunyarn, and leaded, and laid in a bed of Portland cement concrete. A diameter of 4in. is amply sufficient for the drain of an ordinary house. A hope was expressed that before long wrought iron will supersede lead for pressure pipes. House-inspection seemed to be little understood by householders. A mechanic is well fitted to examine into the condition of the pipes and appliances, but of the designing of sanitary arrangements he knows nothing, or less than nothing, for what he does know is faulty. It is almost useless to call in an engineer to examine a house unless he sees the whole of it, and it is equally useless to ask him to certify as to the condition of the house, if the work has been carried out by the local builder from his report, unless he has seen the whole of the reconstruction. He did not think that compulsory inspection by officers appointed by the local authorities will satisfactorily meet the requirements of householders and the public. When the sewage has passed the siphon trap on the main drain the house should have done with it; but such is not generally the case. If the main drain is disconnected from the sewer by a ventilating manhole, any gas which may return will be carried up the ventilating pipe, but as drains are generally arranged it passes into the house. Small pipes and drains should have a gradient producing a minimum velocity in them of 180ft. per minute, and large sewers should have a minimum of 150ft. If these velocities are not maintained deposit will take place, and the sewer will become an elongated cesspool. The quantity of sewage to be discharged is constantly varying, but for practical purposes it may be taken that one half passes away in eight hours. To meet this variation oval sewers have been designed in which the scouring action is more concentrated than in the circular sewer. In a sewer in which the transverse diameter is $\frac{2}{3}$ of the vertical diameter, the radius of the invert is $\frac{1}{3}$, and the radii of the sides $1\frac{1}{3}$ the transverse diameter, measuring 3ft. 9in. by 2ft. 6in. with a gradient of 1 in 900, will discharge 1,000 cubic feet per minute with a mean velocity of flow of 167ft. per minute, and half that quantity with a velocity of 151ft. per minute. This provides for the discharge of the sewage proper of a town of 200,000 inhabitants. If, however, the rainfall on an area of 4 square miles at the rate of 1in. in 24 hours, 80 per cent. of which finds its way into the sewers, be added, the dimensions will have to be increased to 7ft. 6in. by 5ft., and the velocity will be, with the same gradient and running full, 241ft. per minute, while, when discharging 500 cubic feet, the velocity will be 151ft. per minute. Drains must be provided for the removal of rainwater, but these may be taken to the nearest stream, and may be short and small, whereas if the sewer is used for this purpose it necessarily goes on increasing in size up to its outfall. Where pumping has to be resorted to, the introduction of rainwater into sewers is especially to be avoided. However desirable it may be that the separate system should be adopted, there are difficulties in the way. Two drains have to be provided, and workmen are so careless and ignorant that, unless special precautions are taken to prevent it, they will join up the house drains to either conduit indiscriminately; this arrangement would also add to the complication of our underground works. As the maximum velocity in drains should be about 270ft. per minute, these cannot be laid down steep hills, but should be contoured round them. In low-lying ground it is difficult to maintain a velocity of 150ft. per minute, and here, in many cases, flushing or pumping must be resorted to. If lift pumps are used, the expense of plant, buildings, and ground is serious, besides the constant yearly charge for fuel, repairs, and attendance. The greatest care must be taken that the foundations of sewers are sound, and that the material employed is well adapted to resist the acids contained in the sewage and the erosive action of water. Portland cement concrete pipes make good sewers for the smaller sizes, and similar concrete laid *in situ* would be better than brick for the larger sewers. House junctions should be laid in when the sewer is built, even if not at once used, and they should point in the direction of the flow. All angles or causes of retardation should be avoided, as also any splashing, which will cause deposit. All sewers should be laid in straight lines, both as regards direction and gradient, so that their position may be known without difficulty, and they may be easily inspected and cleansed. Sewering through the streets is to be preferred to draining along the backs of houses. A very useful arrangement, where the fall of the drains is small, and where it is desired to irrigate on a small scale, is the flush tank, which, when full, discharges its contents automatically by means of a siphon. The author considered the arrangement designed by Mr. Isaac Shone, of Wrexham, superior to that of Mr. Rogers Field, both in its certainty of action, and in its cheapness. Both these arrangements were good protectors against the return of sewer-gas. The best mode of disposal was to put sewage on the land, and the ordinary sewage farming seemed to be the most natural and simple method. Intermittent filtration is only the same thing in a condensed form. Sewage farms do pay, he stated, when not carried out on too grand a scale, and where not charged with amounts which in no way belong to them. The sludge is troublesome, but it may be collected in tanks, dried and mixed with bone-dust or otherwise, and used as a separate manure, or it may, in some cases, be ploughed into the ground. For the success of sewage farms the separate system is almost necessary. In conclusion, the lecturer dealt with the question of ventilation, expressing his belief that cold air may be introduced into a room without draughts supervening if the aggregate of the openings be large enough, while each individual opening is very small, and if the supply of fresh air for the lights and also for the fire be introduced to them direct.

PROFESSOR NEWTON ON GREEK ART.

PROFESSOR NEWTON commenced a course of lectures on the "Greek Art of the Age of Pericles" on the 7th inst., at University College. He said he had that day to talk about three artists who immediately preceded Phidias, not literally with reference to date, but in style. The first was Pythagoras, who was not uncommonly called Pythagoras of Rhegium, his date falling some time between 500 and 460 B.C., as was proved by the dates of certain statues of Olympic victors which were made by him, and of which Pausanias gave the names. There was an interesting, though, unfortunately, too brief, notice of Pythagoras of Rhegium in Pliny, who said that he was the first to render more like nature, the veins and the muscles, also the hair, of the human form, as represented in his statues. He took more pains, and got out of the previously conventional way of representing those details. In short, he put more life into his figures. He and the other two artists of whom the lecturer intended speaking on that occasion were workers in bronze. He believed there was no evidence that they ever worked in marble. Pythagoras made several statues of athletes, and also a figure of a lame man limping owing to an ulcer in his foot, and in which, according to the testimony of the ancients, the agony of the limping man was admirably expressed in the face of the statue. There was other testimony in ancient writings, to the effect that Pythagoras was the first to impart to his statues the qualities of rhythm and symmetry. Unfortunately, we had no extant samples of his art that we could appeal to with certainty as to their identity.

After a lengthy criticism of the opinions recently advanced in the "Journal of Hellenic Studies," by Dr. Waldstein on the art of Pythagoras, and especially with reference to a statue said to be by him, now in the British Museum, Professor Newton passed on to notice the second of the three sculptors to whom the lecture had reference—Myron, who, like Polycletus and Phidias, was a pupil of Ageladas of Argos. He was a Bœotian, and was said to have competed for a statue with Pythagoras, and to have been beaten by him. His date must, therefore, be put at least as far back as 460 B.C. He was probably a little earlier than Phidias, and, as far as we knew, worked exclusively in bronze, and there was no doubt that he was, in the eyes of the ancients, one of the great early masters in that material. We had a considerable list of his works—twelve or thirteen—and among them were two or three which attracted the special notice of the ancients, not merely of the Roman critics, but of the poets; indeed, it might be said that Myron was the first of the great sculptors of antiquity whose fame had come down to us, not merely in the casual notices of Greek or Roman critics but in the writings of the poets. The third and last sculptor with whom he had to deal in the lecture was Polycletus, who, as already stated, was like Myron, a pupil of Ageladas. According to Overbeck, he was some fourteen or fifteen years older than Phidias, but the notices of him rather indicated that he retained certain archaicisms. His most celebrated work was the chryselephantine statue of the goddess Hera, at Argos, of which we had some faint idea from a bronze coin of the Roman period. This statue was described by Pausanias, and seemed to have ranked next in importance to the two more celebrated chryselephantine statues, viz., that of Athené, at Athens, and that of Zeus, at Olympia. Quintilian, while praising Polycletus very strongly, said that his statues of the gods, beautiful as they were, were deficient in majesty. Of his statues at Athens, the most celebrated were the Diadumenos, an athlete putting on a diadem, and the Doryphoros, an athlete with a spear.

Professor Newton's second lecture was delivered last Friday. It dealt with the public works at Athens dating from that period, but in order fully to appreciate the character of those it was necessary, he said, to give a retrospective sketch of Athenian history from the date of the taking of Athens by the Persians, B.C. 480, when the temples on the Acropolis were burnt. The half-century between this date and the breaking out of the Peloponnesian war, B.C. 431, might be conveniently divided into three periods corresponding with the successive administrations of the three great Athenian statesmen, Themistocles, Cimon, and Pericles. Themistocles, the victor of Salamis, had for his first object the fortifying Athens after the retreat of the Persians. In spite of the jealous opposition of Sparta, he succeeded in building a wall seven miles long round Athens itself. His next work was to fortify the Piræus and Munychia with a wall 14ft. or 15ft. thick, built throughout of solid blocks of stone. This gave complete security to the shipping in the harbour of the Piræus. The further plans of Themistocles, which probably included the connecting Athens with the Piræus by the long walls, were cut short by his banishment, B.C. 466, when Cimon rose to power. The southern wall of the Acropolis was built by him, and the great bronze statue of Athene Promachos, on the Parthenon, may have been dedicated during his administration. The great painter Polygnotos was his personal friend, and painted the Stoa Poikile, and the Theseium. One of the first acts of Pericles on coming into power after the banishment of Cimon was the building of the long walls which connected Athens with the Piræus, converting the port and the city into one great fortress. The building of these walls was commenced B.C. 458, and completed B.C. 451. Round the harbour of the Piræus was built a new city on a regular plan, designed by the celebrated architect Hippodamos of Miletus, who afterwards built Rhodes. Docks, magazines, and an exchange for merchants were also constructed on a grand scale, so as to make the Piræus a port suitable for commerce on an extended scale. It was about this time that the treasury of the Hellenic Confederacy was transferred from Delos to Athens, a change which added greatly to the power and resources of Athens. After waging many wars with chequered fortune, but of which the result, on the whole, tended to extend and consolidate the empire of Athens, a peace was concluded with Sparta, B.C. 445, which gave a short interval of rest before the outbreak of the Peloponnesian war. It was in this interval that Pericles, having secured the Piræus and Athene by completing the vast scheme of fortifications originally planned by Themistocles, turned his attention to the adornment of the city. It was then that the Parthenon was commenced, which was completed 437. The Propylæa, the building of which was carried on from B.C. 437 to 431; the Odeum, a musical theatre, of which the roof was made of the masts of Persian ships taken at Salamis; the great temple of Demeter at Eleusis; the temple of Nemesis at Rhamnus; the temple at Sunium, and the Erechtheum on the Acropolis were all commenced probably about this time. Professor Newton then explained the drawings by which the lecture was illustrated, and which comprised views of the Acropolis taken from different aspects, a restoration of the Propylæa, and a view of it in its present ruinous state, a restoration of the east front of the Parthenon, a view of the Erechtheum, and a plan of the Acropolis showing the most recent discoveries. He then gave a brief description of the architecture of the Propylæa, the Temple of Victory, the Parthenon, and the Erechtheum, Thesium, the paintings of Polygnotos, Myron, and Panænos, in the Stoa Poikile. The cost of the public works in the time of Pericles could not be exactly ascertained. The Propylæa alone, according to Heliodorus, cost 2,012 talents, a sum reckoned as the equivalent of £460,000. Leake thinks that in this amount must have been included most of the outlay on the Odeum, Parthenon, Elusinium, Propylæa, and Erechtheum, and calculates the whole expenditure on account of these at 2,950 talents. The whole amount is calculated by Grote at £690,000. The liberal expenditure on public works, dramatic entertainments, and festivals which distinguishes the age of Pericles had its source in the main in the wealth which flowed into Athens in the form of contributions, direct or indirect, from her dependencies. Plutarch, in a well-known passage, draws attention to the fact that these public works, so exquisite in their finish, were constructed in an astonishingly short time. They were, as he expresses it, made quickly to last long.

At a special meeting of the members of the Derby Mechanics' Institute, held on Wednesday week, plans prepared under the direction of the committee for the erection of new premises in the Wardwick, at Derby, at an estimated outlay of £4,500, were approved, and the committee was authorised to obtain tenders.

HARROGATE CONSERVATIVE CLUB COMPETITION.

THE choice in this competition has fallen, as we stated last week, on a design marked "X," by a local architect, Mr. Arthur Hiscoe. The object of the competition was to provide a large public hall, which is much required for an important town like Harrogate, also a suite of assembly-rooms with bed-rooms, and a Conservative club. The site fronts the Cambridge-road, and a footpath. Mr. Hiscoe has made the front elevation towards Cambridge-road, in the centre of which frontage is the door to the assembly-rooms; on the left of this entrance is an excellent refreshment-room, 30 by 18ft., properly connected to a kitchen at the back. On the west of the refreshment-room is a ticket-office, and on the left of this is the main entrance to the Alexandra Hall, with a secretary's-room on the otherside. The hall is 76ft. by 32ft. 6in., and will accommodate 500 people. Passage communication is made with the assembly-rooms, and the billiard-room fronts on to the footpath called Beulah-place. An entrance is arranged in the centre of this frontage, and is made the entrance to the Conservative club, with a reading-room on the left; in the corner there is also a smoke-room, each 18ft. by 14ft. The stairs from main entrance to assembly-rooms lead to a corridor 5ft. wide, which conducts to the gallery of the hall and the bedrooms. There are steps from the entrance in Beulah-place, which lead to the club-rooms, of dining-room 20ft. 6in. by 18ft., with necessary rooms connected; a reading-room 18ft. by 14ft., smoke-room and billiard-room, for two tables, two stories high. The w.c.'s and lavatories on each floor are well situated and lighted. The bakehouse is in the cellar, and the second floor is devoted to bedrooms, w.c., &c. The front elevation is certainly one of the most practical where expense is a condition. It has an Italian frontage to Cambridge-street, two stories and attic story. The whole of the entrances are well marked, and make an imposing elevation. A handsome portico of good Classic proportions adorns the three entrances, and the windows on the ground and first floor have cambered heads, the dormer windows having circular heads in the attic story. The roof over the entrance to hall is detached and higher than the other, and marks the entrance very well. The entrance in Beulah-place is in a projecting bay, and is carried up three stories, and a domed roof over a handsome Classical portico, and the cambered-headed windows makes this frontage worthy of being a frontage to an excellent street.

The design which is placed second in order of merit is one marked with a Star for a motto, by Mr. R. Dyson, of Harrogate. The leading feature is the connection of the entrances to the hall and assembly-rooms, which are only separated by a wall. On the left of the entrance to the assembly-rooms (which are, by the way, very narrow, a fault spoiling the design very much) is placed the coffee-room, and at the back is the public hall, 70ft. by 30ft. This is all that this entrance leads to, no ticket-office being shown. The adjoining entrance is equally narrow, and leads only to the various committee-rooms. The chief entrance is in Beulah-place, in the centre, with a dining-room on one side and a reading-room on the other. These are for the Conservative club, while the entrance passage leads into a hall of excellent proportions, in which a handsome flight of steps is shown to the other club-rooms, comprising the billiard-rooms, coffee-rooms, and other rooms so necessary for a building of this kind. There is also another smoke-room over the dining-room of the ground-floor. The elevation spoils the design, having the chief entrance at the end; but probably the author, Mr. Dyson, considered that, on account of the small sum of money that was to be laid out on so large a building (only £3,000,) it was better to make a frontage of less length than that to Cambridge-road. The elevation, however, is good, and the best drawing of the whole. It is Classical, in three stories of the three different orders, the door being in the centre. Three-light windows are placed on each side, all with semicircular heads; a gable is placed over the bay in which the entrance-door is shown, and a parapet over this with an open colonnade. The cornices and dentil courses inseparable, however, from a Classical elevation of this kind must add materially to the expense. The elevation to Cambridge-street shows ordinary square-headed windows on the ground-floor, and cambered heads to the floor-windows, which range in one long

row. The building is on this side only taken up two stories and attics, which are lighted with circular-headed dormers; but this frontage will not compare favourably with that to the end elevation. The large windows to the coffee-room, with relieving arches over, and projecting chimneys built out from first floor, should not belong to the same building as the open colonnade of the end elevation.

"Café" (by Messrs. Perkin and Bulmer, of Leeds and Harrogate), is a good design. It shows two elevations towards Cambridge-street, with a good ground-plan, in which the entrance is made on the extreme left of the building, and leads direct into the Alexandra Hall, 75ft. by 34ft. The club dining-room is on the right of this passage, and occupies the frontage. In the centre is the entrance to the assembly-rooms, with the coffee-room and kitchen on one side, and a smoke-room opposite and the steps. The billiard-room is to Beulah-place, in the north corner, and the S. E. corner is the entrance to the club, which is again upstairs with smoke-room, dining-room, card-room, and billiard-room, 35ft. by 24ft., over club dining-room and entrance to public-hall. There is an excellent hall at the end of the staircase on the first floor, which is an advantage over any of the other designs. The front elevation, which is certainly the best, shows a large gable in open timber, in centre of building, and the whole of the attic story is in open timber-work. The club dining-room, and the billiard-room over, are only two stories high. A bay-window is shown at each side of the main entrance to assembly-rooms, which stops under the open-timber gable. The end is also in open timber, as is the front, and if it were to be built, it would reflect great credit to the architects. The windows and doors are square throughout, and, like the whole of the other designs, it is proposed to be of pitch-faced stones and ashlar dressings apparently. The alternate elevation is an Elizabethan design, with two gables to main building two stories high, with a Mansard roof, and sky-lights for attic-story, and the entrance to the hall is roofed with a hipped roof.

The whole of the drawings are got up in pencil only and colour, and the one which has had the greatest pains taken with it is undoubtedly one by Mr. Geo. Mallinson, under the motto of "Mon Patria." It shows a large hall, like all the others, on the left of the principal frontage to Cambridge-street, with committee-room on the left of the entrance to same; on the right are smoke- and dining-rooms, and are connected with entrance to assembly-rooms, and a billiard-room is placed at the back, and lighted from Beulah-place. In a similar manner to the last-mentioned design, the entrance is placed at the corner of Beulah-place and Cambridge-street, and the stairs run up from an octagon hall to the club on the first floor, which are ably designed to give easy access to a large billiard-room suitable for two tables, and a committee-room, as well as smoke and other rooms, necessary for a building intended for such a purpose. It is so capitally arranged, that we venture to say that, if the elevation had in any way compared with the plan, the allotment of the designs would have been different. The elevation shows one huge ugly Mansard roof and gable only, relieved from dreary hideousness by an excellent turret, and arranged in the corner and over the entrance to the club-rooms. It is a pity to see such a plan so spoiled in the elevation. The other designs (only two or three) need no special mention.

LONDON SMOKE, ITS COST AND CURE.

A LECTURE was delivered on Wednesday night at the Society of Arts, John-street, Adelphi, by Mr. W. D. Scott-Moncrieff, C.E., entitled "Suggestions for Preventing London Smoke, and Making it Commercially Available." Mr. R. Rawlinson, C.B., occupied the chair. Referring to the present condition of London as regards its fuel, the lecturer said there were, leaving out the question of coke, about four millions of tons of coal consumed in London every year, in addition to which about two millions of tons were used by the gas companies for the purpose of extracting light. All this quantity was passed through retorts, and, after a large amount of bad gas had been extracted, it was converted into coke and cinders, the average amount of gas extracted from one ton of coal being 10,000 cubic feet. The result of practical experiments had proved to him (the lecturer) that by extracting only from 3,000 to 5,000 cubic feet per ton, instead of cinders, there remained an excellent and smokeless coal, and the gas extracted, instead of being only 16-candle strong, was 24-candle strong. What he, therefore, proposed was that the gas companies, instead of taking 10,000 cubic feet of gas per ton from 2,000,000 tons of coal, should extract 3,333 cubic feet per ton from 6,000,000 tons, the whole quantity required for consumption in London. The result would be that the companies would have double the quantity of products they had at present in the shape of tar and ammoniacal liquids; the community would have 24-candle instead of 16-candle gas; the fuel resulting from the process would light readily, and would make a cheerful fire, giving out 20 per cent. more heat than the common coal now in use, and, what was most important, there would be no smoke from it. He then went on to show by figures that if the whole of the 6,000,000 tons consumed yearly were treated in this way, the value of the gas extracted would be £1,750,000 more than under the present system, and the coal could be sold at a cheaper rate than now. In conclusion, he said statistics showed that if the system were carried out there would be an annual saving of £2,125,000, which might be taken as the yearly value of London smoke. London would then be a smokeless city, and all that would have to be deducted from the £2,125,000 per annum would be confined to a few items, such as the cost of additional capital required for transit, appliances, and the terms to be made with the gas-companies for carrying out the scheme.

KITCHEN-BOILER EXPLOSIONS.

THE usual list of killed and wounded from kitchen-boiler explosions has already far exceeded its average annual proportions. There is not the slightest reason why a kitchen or bath-boiler should ever explode if properly fixed by a plumber who has the smallest amount of common-sense. Mr. Thomas Fletcher, F.C.S., of Warrington, points out:—There are two simple ways by which an explosion can be totally prevented—one by fixing a dead-weight safety-valve, which should be for convenience fixed when the apparatus is put up first. The other is to cut a hole in the hot-water return-pipe a little distance above the boiler, this hole being from ½in. to 1in. in diameter, and to solder over this a piece of sheet lead about 1-32in. thick, just sufficient to safely stand the general water-pressure, making, in fact, a weak place in the system of pipes which will be the first to give way. This hole must be cut in such a position that the pipe is certain to be warmed from the fire, and as near as possible to the boiler. It must also be where, in case of the sheet-lead being blown out, the water will not be thrown into the room, but into the fire, so as to extinguish it. Any plumber should do this for a shilling or two, and although it is liable to make a mess, it only does this when an explosion would occur in its absence. It is also easy to put an escape-pipe, through which the water could be led away to the outside of the building in case of accident. This thin lead safety-disc might be made so as to fix in a brass socket and be easily replaced if an accident did occur. There are many simpler, cheaper, and more satisfactory arrangements for circulating boilers, which can be fixed at less than one-tenth the cost, and of all these the best is a galvanised iron or copper cylinder of about eight gallons capacity, with a tap, and a good gas-heating burner underneath it, the cylinder having a loose lid and a water-supply tap over it for filling as required. After some months' daily experience with this, there is no doubt that it is far cheaper to use than the circulating boiler system, and far more useful for general work. It has also the advantage of absolute safety under any possible condition.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

CUMBERLAND AND WESTMORELAND ANTIQUARIAN SOCIETY.—The winter session of this society was held at Penrith on Wednesday and Thursday in last week, in the Assembly-room, where a loan collection of ancient arms and armour had been brought together. A visit was paid on the first day to Brougham Hall, where the private chapel and the collection of armour in the hall were inspected, and a paper on "Armour" was read by the Rev. T. Lees, of Wreay. In the afternoon, a paper by Dr. Stephen, of Copenhagen, was read on the Runic stone found at Brough, which was stated to be the first inscription in Runes discovered in Westmoreland, and purported to be the grave-kist of Cimokom, wife of Alh; the probable date was the later part of the 6th century. The Rev. H. Whitehead read a paper on "The Old Church Plate in Brampton Deanery;" the Rev. T. Lees one on "Sculpture at Longmarton Church"; and Mr. Joseph Robinson one on "Roman Remains near Wolsty Castle." These consisted of a square camp, resembling those at Risehow and Bowness, but differed in having very deep foundations but no internal floors. On the second day, Mr. R. S. Fergusson read a paper on the alleged "Labarum at Carlisle Cathedral," recently discovered by Precentor Venables. He produced a copy of 315 masons' marks found in the Cathedral, and stated his belief and that of Mr. Creed, the clerk of works, that the alleged sacred monogram was merely a Mediæval mark placed on a stone by masons who quarried it from the Roman wall. In this Mr. Lees and others agreed, it being stated that Mr. Venables had made a mistake. Sir George Duckett read some notes on "Royalists' Memoranda, tempo Charles I.," and a discussion after took place on the stone circles at Raisbeck and Maughanby.

PARLIAMENTARY NOTES.

THE ARTISANS' DWELLINGS ACTS—Sir R. Cross intends to move for a Select Committee to consider the working of the Artisans' Dwellings Act, 1875, and the Metropolitan Streets Improvement Acts of 1872 and 1877, and especially to inquire into the causes that have prevented the reconstruction of dwellings for the poorer classes to the extent contemplated and authorised by those Acts. This motion originally stood in the name of Sir Sydney Waterlow, but it has been arranged that it should be placed in the hands of the late Home Secretary. The motion stands for to-day, but there is not much chance of its being reached.

THE REMOVAL OF SNOW IN LONDON.—Sir H. Verney on Monday asked the Chairman of the Metropolitan Board of Works whether his attention had been drawn to a description in *The Times* of the 20th inst. of the plan adopted in the city of Milan for clearing away the snow by dividing the city into districts; and whether he would direct that arrangements should be made now, and in case of future snowstorms, for this purpose, the work being carried on by night as well as by day all through the metropolis, including the parks, the snow being carted to the Thames and other waters, and thus work given to thousands of men who are thrown out of employment by the weather. Sir J. M'Garel-Hogg: I beg to state that I have observed the description in *The Times* to which he refers; but it is not in the power of the Board over which I preside to adopt that or any other plan of clearing snow from the streets of the metropolis, which are under the sole charge of the local authorities. I think I may say, however, from inquiries instituted in some of the largest parishes, that great exertions are being made to grapple with the present difficulty. On the Victoria Embankment, over which my Board has control, 400 men, 40 carts, and two snow-ploughs were employed for nearly three days in removing the snow, beginning work at 3 o'clock in the morning. This shows the immense quantity that fell, and I may had that, assuming a depth of 6in., the fall of snow over the whole metropolitan area of about 117 square miles has been roughly estimated at the enormous amount of 8¾ millions of tons. The House will see that to cart all this away in a few days, in many cases to a considerable distance, would be a matter of absolute impossibility.

FLOODS AND DRAINAGE.—The Government Bill to make provision for the conservancy of rivers, the prevention of floods, and other matters, is to be known as the Rivers Conservancy Act, 1881. It provides that any 20 or more owners or occupiers of land rated at not less than £2,000, or any conservancy or sanitary authority having jurisdiction within any part of a river basin, or contiguous river basins, may apply to the Local Government Board that such basin or basins may be constituted a conservancy district, and that a conservancy board may be established. After local inquiry the district may be established by provisional order subject to the following regulations:—1. Wherever just and practicable the district shall be divided into three descriptions of land, (*a*) lowlands, (*b*) midlands, (*c*) uplands, and each of the said descriptions shall contribute in a different proportion to

the expenses, or part of the expenses of the Conservancy Board as may appear equitable. 2. The highest rate in the pound payable by any lands declared to be uplands shall not exceed one-sixth part of the rate in the pound payable in respect of the lands in the district which pay the highest general rate. 3. In constituting the board care shall be taken to secure thereon an adequate representation of owners as well as of occupiers, and provision shall be made wherever circumstances shall require for the representation of urban sanitary authorities, conservancy authorities, or other similar bodies. The powers of the conservancy board will be for the prevention of floods, for arterial drainage, for the storage of water, for the irrigation of land, or any such purposes. The boards will have powers as to works, as to giving compensation, as to acquisition of land, as to survey of water-courses, and as to enforcement and commutation of liabilities. The whole of the expenses of the improvement of works and of the construction of new works, and one-half of the other expenses incurred by the board shall be borne by owners of land within the district. The remainder of the expenses incurred by the board shall be borne by the occupiers of the lands within the district, and the Conservancy Board shall provide a fund, to be called the Conservancy Fund, to be raised by rates made on the owners and occupiers of lowlands, midlands, and uplands within the district of the Board, on the basis of the ratable value of the property assessable to the poor rate. An urban sanitary authority may be constituted a Conservancy board for their district; and where so constituted, the Local Government Board may provide that the expenses incurred by such authority may be wholly or partly borne by the general district rate, or other rate out of which their expenses as such urban sanitary authority, under the Public Health Act, 1875, are defrayed.

Building Intelligence.

BATTLE CHURCH, BRECONSHIRE.—This church has just been reopened after a complete restoration, undertaken at her own expense by Lady Cleasby, widow of the late Sir Anthony Cleasby, who is buried in the churchyard. The church, situated in a wild mountain district, is a small plain structure of the Perpendicular or Tudor date; the chief features being a good segmental oak roof, with well moulded intersecting ribs and cornice, and a good Perpendicular east window. The roof has been repaired where necessary; the whole of the windows and stone dressings carefully renewed; a porch with oak roof and traceried barge-board added to the north doorway; a small vestry added on the south side. The whole of the old fittings, which were modern and without the least merit, have been removed and replaced in pitch-pine varnished. The chancel floor has been raised two steps, and an open screen in pitch-pine on a plinth of Forest of Dean stone erected between it and the nave. Godwin's encaustic tiles have been laid in chancel and nave. A font of elaborate design has been well executed in green Bridgend stone by Mr. W. Clarke, carver, of Llandaff. A reredos in pitch-pine, with inlaid texts and carved cornice, will be fixed at the east end. The work has been carried out by Messrs. Williams and Sons, of Brecon, from the designs of Mr. J. Bacon Fowler, architect, of Brecon and Swansea.

BRISTOL.—New premises for a local firm of spirit merchants have just been completed at Bristol from the designs of Mr. J. Bevan, architect, of that city. The building will have a frontage of 179ft. on the north or New Baldwin-street side, and 55ft. of east frontage in Marsh-street. The cellarage alone covers 9,000 superficial feet. From the street-level to the top of the dormers the height is 60ft., and to the top of the turrets 80ft. The building is in the French Renaissance style. Messrs. Wilkins and Sons, of Bristol, have been the contractors, and the work has, during the past two years, given employment to some hundreds of men. The carving has been done by Mr. E. Sheppard, of Bristol.

DARLINGTON.—Extensive alterations and additions are about to be made to the Wesleyan chapel, Bondgate, comprising the lengthening of the chapel from east to west, new entrance, lobbies, repewing, new pulpit, and the enlargement of present vestries, and erection of new vestries and committee-rooms. Mr. G. G. Hoskins, F.R.I.B.A., of Darlington, has been entrusted with the work.

DALRY, EDINBURGH.—The memorial-stone of a new Free Church, which is in course of erection on a site at the west end of Dalry, was laid on the 15th inst. The building, which has been designed by Mr. Raeburn, architect, is in the Gothic style. The principal features in the front gable elevation are a deeply-moulded doorway and a large four-light window with tracery. Buttresses rising into pinnacles above the roof also impart character to the design. At the west corner there is to be a spire rising to a height of about 130ft., with belfry and clock. Above the belfry the spire breaks into the octagon, and is surmounted by a weather-vane. The church is designed to seat 800 worshippers, and it is to cost about £5,000.

NANTWICH.—The new children's home and schools for Nantwich union, adjoining the workhouse, are now almost ready for the reception of the children for whom they are intended. The exterior measures some 77ft. in length by 20 in. depth. The building is semicircular in design. The heating arrangements, we may add, were provided for by Mr. E. H. Shorland, of Manchester. The schoolroom will accommodate some 70 scholars. The contract for the home and schools has been satisfactorily carried out by Mr. James Madely, the contract being for £3,200, Mr. J. Heywood being his foreman over the workmen. Extensive alterations have been made also at the workhouse itself by Mr. Madely, whose contract is for £1,460.

NORWICH.—A large block of buildings, which have been erected at the corner of Redwell and Princes-streets, for the accommodation of Princes-street Congregational Chapel Sunday-schools, were opened on Monday week. The chief façades are Classic in character, and are built of white brick with mouldings and dressings of ornamental Cossey bricks. On the principal floor is a lecture-hall 62ft. by 39ft. and 32ft. high, accommodating 700 persons. The roof of hall is coved and panelled, and has a cornice and bold corbels, and light is given by a long lantern 24ft. wide. On three sides is a overhanging gallery 8ft. wide with iron balustrade, and on the fourth side is an apsidal recess for organ, with a lower and upper rostrum in front. Beneath the gallery are doors opening into a series of class-rooms, ranging from 12ft. by 9ft. 6in. to 19ft. by 12ft., a library and superintendent's, and secretary's rooms, and at the end of hall, on gallery level, are two large class-rooms, with folding rooms opening into the main room. The woodwork is of pitch-pine, varnished, and the corridors and passages are paved with Minton's tiles; the heating is by hot-water, supplied to every room on Perkins's principle, and the ventilation on Tobin's principle. Beneath these principal buildings in the basement are two class-rooms 37ft. by 28ft. and 26ft. by 25ft.; three smaller infants' rooms each averaging 16ft. by 10ft.; a mothers' meeting-room 38½ft. by 25ft.; a church-parlour 34ft. by 26ft., and furnished as a drawing-room; kitchen 20ft. by 12½ft., and heating chamber. Mr. Edward Boardman, F.R.I.B.A., of Norwich, the architect of the adjacent chapel, designed and superintended the erection of the buildings, and Messrs. Downing and Sons were the builders. The total cost of building and fittings was £12,605, including £4,450 for site.

CHIPS.

The annual meeting of the Hull School of Art was held on Thursday, the 20th inst., when Mr. Menzies, the head-master, reported that the increased comfort and accommodation of the new premises in Albion-street had considerably increased the results in the examinations. In the national competition, one bronze medal and two book prizes were obtained, and in the third grade competition, 19 prizes; in the second grade local examination, 17 students obtained 19 prizes, 64 passed in one or more subjects, and 11 obtained full certificates.

Mr. H. Scott Hayward, of Frocester, Gloucestershire, has been appointed surveyor and inspector to the Inclosure and Copyholds Commissioners, in the place of the late Mr. Marcellus Newtown.

A new house for Mr. A. W. Vaisey, at Tring, is about to be erected. It will be faced externally with black chalk flints and bright red brick quoins to angles and reveals up to first floor level, and above (except to one or two gables) with ornamental dark red tile hangings; the roof will be covered with Broseley tiles. The contract is let to Mr. James Honour, and Mr. William Huckvale, of Tring, is the architect.

More than Fifty Thousand Replies and Letters on subjects of Universal Interest have appeared during the last ten years in the ENGLISH MECHANIC AND WORLD OF SCIENCE, most of them from the pens of the leading Scientific and Technical Authorities of the day. Thousands of original articles and scientific papers, and countless receipts and wrinkles embracing almost every subject on which it is possible to desire information have also appeared during the same period. The earliest and most accurate information respecting all new scientific discoveries and mechanical inventions is to be found in its pages, and its large circulation render its the best medium for all advertisers who wish their announcements to be brought under the notice of manufacturers, mechanics, scientific workers, and amateurs. Price Twopence, of all booksellers and newsvendors. Post free 2½d. Office: 31, Tavistock street, Covent-garden W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.
(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. R. M. TUTTLE, of 13 and 15, Laight-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—D. D. and Son.—W. G.—C. Co.—H. Bros. and E.—A. H. I. Co.—M. J. Co.—R. and G. N.—C. of K.—J. H.—M. L. B.—S. T. and Co.—T. R. and Son.—B. of H.—Lieut. N.—C. H. and Co.—W. and B.—G. W. Ry. Co.—L. and Y. Ry. Co.

C. M. BEDFORD. (Gwilt's "Encyclopædia," Longmans and Co., covers most of your requirements. Write the same publishers, and Lockwood and Co., and B. T. Batsford for catalogues.)—J. JOYNSON. (Valuations must bear a stamp, from 3d. on amounts not exceeding £5, up to £1 for amounts over £500.)

"BUILDING NEWS" DESIGNING CLUB.

BONUS HOMINUS. (The description of "Frank's" design applies also to yours. They are both alike in general plan. The mottoes are rightly distinguished, but "canted corner dwelling" should have read "canted corner dwellings.")—K IN CIRCLE. (A small sketch of sedilia will do.)—EPHRAIM. (Too late for review.)

DRAWINGS RECEIVED.—R. M. F., W. H., E. H., L. B., R. D., W. E. L. J., W. H., T. C., W. H. N.

Correspondence.

THE INSTITUTE EXAMINATIONS.

To the Editor of the BUILDING NEWS.

Sir,—It is the intention, I see, of the R.I.B.A. to institute an examination for future associates ere admitted. The young aspirant will probably think that the ordeal should be submitted to by all the existing members; that those who make the rules should submit to the ruling. If examination is necessary for the associates, why not for the Fellows? Is it not more necessary for the Fellows than the juniors? I certainly do not consider the Fellows up to the right standard, and at a late meeting was struck by the disadvantageous light in which the Fellows appeared from their ignorance. It was the evening when the paper was read on the Isle of Wight Roman antiquities. One Fellow, supposed to be our authority in Classical matters, had to be informed by a visitor that glass for windows was used by the Romans. Another Fellow showed his lack of general information by asserting his belief in fossilised human brains (in a *figurative* sense, the statement is only too true), and none of the Fellows present had *gumption* enough to put right the two wild theorists, one of whom asserted that the Romans only built their walls about 3ft. high, and that the upper portion was wood framing and plaster; the other that a specific meaning was attached always to a certain geometrical form. These people will now ride their hobbies more furiously than ever, their assumption being uncontradicted that the R. I. B. A. coincides with them. The idea about the Roman buildings is an utter delusion. The Romans were good constructors and fond of

stone, and such materials were abundant. To make the upper portion of walls of wood-framing, would have been more trouble and expense than using stone, and would have had no advantage. It may therefore, safely be said that *the walls were of stone their whole height*. But how, then, Mr. Smith would say, can you possibly account for the circumstance that in so many different parts of the country, the walls of Roman buildings are found about the same height. The reason is, that the same conditions have befell all, and the history of this Isle of Wight example will suffice.

Here, as everywhere else, where the Romans penetrated, they settled down to remain. They built handsome houses and made themselves at home, and no doubt much benefitted the natives, but unhappily did not teach them arms, so that when at length the Romans left, the northern rovers made this kingdom their prey. The Roman villa now under consideration, when deserted by its first masters, would doubtless be taken possession of by the natives, who were not long, however, in tenancy. In the middle of the fifth century, the Jutes made a raid on the island, plundering and destroying. The villa would attract their attention, of course. It was no doubt rifled of all portable valuables, and then set on fire. As only one skull was found, it would seem there was little defence made against these savages, as they probably would exterminate the scant population. The bare walls of the villa would now stand forlorn and dropping slowly to decay for the next six hundred years, civilisation being blotted out by the Northmen. In the eleventh century, stone building was revived, though in a rude fashion. The workmen, without much skill or proper tools, would, we may be sure, eagerly seize on the materials of the ruined villa in preference to quarrying new stone. There is abundant proof that this was generally done, and so the walls of the villa would be rased to the ground-level, the goodness of the Roman mortar and want of tools preventing the destroyer's going lower. But this level of the eleventh century is not the same level as of Roman times. It is 2ft. to 3ft. higher, the ground by mouldering of stone and decay of vegetable matter having risen. From the eleventh century to the nineteenth the ground has still been rising, though the increase, partly by woods being cut down, and from agricultural use, is not so great as before. The first rise of ground gives the height of Roman remains as now found. The second period covers to a depth of about 2ft. the top of the walls. In towns the case is somewhat different. The walling materials was sooner made use of, so that little beyond floors are found, and from the great quantity of building debris, rubbish and dirt in towns when unpaved, the accumulation of soil has been much greater than in country places, where the villas are usually found. In towns Roman remains are usually 15ft. or 20ft. below modern level.

As regards the other theory, of the geometrical figure, mentioned by a visitor at the meeting aforesaid, suffice it to say that the simple radical forms of square, circle, and triangle have been used by all nations at all periods possessing any taste for ornament, with or without relation to any particular religious dogma, and so they will continue to be used, as none others can be invented; but religious ideas do not necessarily accompany their use. The practice, I beg to note, at present ruling in the Institute of abbreviating the papers read for publication, so taking out all their life, light, and spirit, is a very stupid one.—I am, Sir, &c. M.

SIR,—As passing a compulsory examination is to be the diploma of all candidates for the architectural profession this year, I have for some days been inquiring in my own mind the extent and time which this enforcement will take to remedy some of the evils at present existing in the profession. The opinion of its members at large upon so important a matter, though your valuable columns, will, I think, be gratefully acknowledged by all.

The most important inquiry may be: Is there any remedy at law to immediately put down all who have been practising in the name of "architect" who are not properly qualified men? Further, will it have any influence in abolishing a perhaps worse evil—that of underselling in the charges of professional practice—one too common amongst many equally qualified men in this as in other professions.

One other inquiry may be made by some of our junior members—namely, are all who are at present students of architecture not in practice to pass their examination before they can enter upon a private practice for themselves?

If there is, under the present rules of the profession, any hindrance to the remedy of the evils mentioned, they should now be put into new form.—I am, &c.,

DESIDERATUM.

THE SHEFFIELD PARISH-CHURCH FONT COMPETITION.

SIR,—In reply to a recent query as to whether this matter is settled, I beg to say the award was, in due course, made to Mr. Charles Green, of Sheffield, and that this gentleman is at present carrying the work out. How far it will be in accordance with our accepted views of what is correct time will of course show!

Canon Blakeney, the present Vicar of Sheffield, is an old and esteemed friend of my own; and I have, as well, many family ties connecting me with Sheffield and its church. When, therefore, it was decided that the designing of this memorial font should not be entrusted to the local men (Messrs. Flockton and Gibbs) who were then engaged upon the church, I strongly urged the Committee to procure designs from some architect of acknowledged standing, and then get him to procure some good and tried man to execute the work. This, however, was overruled, and an entirely open competition decided upon.

It will be remembered that, at the commencement of the restoration, the work was placed in the hands of Messrs. Flockton and Gibbs, of Sheffield, in connection with the late Sir G. Gilbert Scott, R.A., as consulting architect. Had the latter gentleman been spared all would have been well.

At the time when the competition for the font in question was advertised, Messrs. Hadfield and Son, of Sheffield, whose clever Gothic work we are all more or less acquainted with, wrote to the professional journals, saying it would be impossible for them to intrude a design into a building other architects were engaged upon, and this feeling was, no doubt, shared by many others in the profession. But I venture to urge that it would have been better for the public weal if the Messrs. Hadfield, or some other architects of ability, had seen their way clear to secure to Sheffield's ancient parish-church a font of a character worthy of its surroundings.

I do not say that this will not be so as it is; but without having had any opportunity for seeing the accepted designs, I shall venture to assert that this is very doubtful; for, Mr. Charles Green—although an artist of no mean ability—is, I believe, no lover of Gothic.

Many of us find ourselves in Belgium every now and again; and as we pace the grand old Flemish churches, we gaze with mixed feelings at the huge summer-house-like pulpits which adorn so many of them. These pulpits are perfect marvels of wood-carving; in skilful workmanship they surpass anything that we people in England can do; and yet, they are so out of character with the immediate surroundings, that we look at them, hardly sure whether we ought to rejoice most in their wondrous art-power, or lament their utter want of sympathy and of character with the building they form a part of.

Four miles or so from Sheffield is Rotherham. The parish-church of this latter town is of about the same date, and is even finer than that of Sheffield. It was restored some six or seven years ago, by Sir G. G. Scott.

A memorial font to the late Vicar, who died a year or two ago, being proposed, a design by request was prepared by Mr. J. P. Seddon, of Queen Anne's-gate, W.C., and was illustrated at the time in this paper.

Mr. Seddon was good enough to entrust the carrying out of his design to myself, and by Whitsuntide the work in question will be *in situ*. It will be instructive, when both are in place, to compare their respective merits, and then, for everyone to judge for themselves which course seems productive of the best results.—I am, &c.,

HARRY HEMS.

Exeter, Jan. 22, 1881.

SHOULD SOIL-PIPES BE FIXED UP OUTSIDE OR INSIDE HOUSES?

SIR,—This is a subject upon which considerable difference exists both amongst architects and plumbers, and, as a good deal of that difference is owing to the supposed extra danger from frost if the pipes are fixed up outside, this is the very time to discuss the question.

At page 391 of your issue for May 17th, 1872, I referred to this in connection with "Fig. 112," which showed a vertical soil-pipe fixed up outside with a lead branch pipe coming into it—part of this lead branch-pipe being exposed outside—and I then stated that if the vertical pipe got frozen up, this lead branch-pipe was often useful by admitting of a slit being cut in its top which would allow the water often to flow out harmlessly outside and so prevent the house being flooded. The cutting of this slit may allow a kitchen-sink to be used after the vertical iron pipe has been frozen up. In cases where the soil-pipe or waste-pipe gets frozen up even although fitted up inside of the house, as is the case at present in properties I know of, then no such "safety-valve" in the shape of "cutting a slit," as above referred to, can be done; so that even in this matter of freezing-up, an outside soil or waste-pipe has some advantage over an inside one.

Looking at the matter from various standpoints, and especially considering what is best for the safety and health of the inmates, I support the idea that, as a rule, soil-pipes (and waste-pipes too) should be *outside*. This is recommended in the model by-laws of the Local Government Board of A.D. 1877; and, in reply to the objection as to extra annoyance or danger from temporary freezing, I remark:—*Take precautions*.

As to these "precautions," I may first observe that it is not the soil-pipe that freezes, but the water in it. No water should be in it, however, except in the act of flushing, and that will hardly freeze it up. What causes soil-pipes and waste-pipes to freeze up is generally a continual leakage from some crane or valve, &c., that does not, or is not, shut when it ought to do so. A leaking ball-crane in a cistern, if the cistern overflow enters the soil-pipe, is almost sure to produce a frozen-up soil-pipe. I have a case of about 60ft. of frozen-up soil-pipe from this cause. Had the cistern-overflow discharged outside and where it could be seen, I do not expect the soil-pipe would have been frozen up, even although it is outside. Other outside soil-pipes, where there has been no such leakage, and where the cistern-overflow does not enter the soil-pipe, are not frozen up, even where there are several water-closets into one soil-pipe. As water requires to be in the traps, putting salt-water down, especially last thing at night, would help to prevent them getting frozen up.

A second "precaution" for the soil-pipe itself is to fit up one of a good thickness of metal. If the vertical pipe is iron, then, instead of being only about one-sixteenth of an inch thick, it should be a cast-iron pipe one-quarter of an inch thick, and get several coats of paints. If a still further "precaution" is wished, then the vertical pipe may be boxed up inside of a neat wooden case, as high up as the water enters, and also filled round with sawdust or other non-conducting substance. The hole in the wall where the branch soil-pipe comes out at should be tightly plastered or filled in all round the pipe to prevent a draught of cold air blowing in under or alongside of the pipe. These cold draughts often cause pipes to get frozen up. Wrapping up the pipes inside with felt is, of course, a good preservative.

One reason which may be termed "scientific" as well as sanitary, which I do not remember of having seen referred to as yet, for placing the soil-pipe outside, and which may be especially worth mentioning while the present aërial crusade against the bad air in our towns and cities is being waged, is that a soil-pipe placed outside *generates and discharges into the air* far less sewage gas than one fitted up inside.

It would be an advantage to hear the opinions of some of your other correspondents upon this question at this time, and especially if they would state how their soil-pipes are fitted up, and what they are made of, and how they stand as regards the above "precautions."—I am, &c.,

W. P. BUCHAN, S.E.

21, Renfrew-street, Glasgow, 22nd Jan.

HOUSE-SANITATION.

SIR,—I should be glad if you would allow me to protest against Lieut.-Col. Jones's remarks

with reference to what I said in opening the discussion on Mr. Robins's paper at the Royal Institute of British Architects.

The fact that three books from my pen have recently appeared, in each of which the principles and practice of house-sanitation are set forth, one being entirely devoted to that subject, and that I have given a very large number of public lectures on it to all classes of hearers, shows plainly enough that my aim has been "to spread the knowledge of the very simple rules of health"; and if Lieut.-Col. Jones will take the trouble to look at either of those books he can satisfy himself that this is the case. I think that the more people know about the sanitary arrangements of their houses the better; but I said, and repeat it most distinctly, that a person who is not practised in carrying out sanitary works is not competent to put his own house in order; that no amount of reading can give that practice, any more than reading can enable a man to dispense with the services of a surgeon when he has to have his leg cut off. I say that it is a most absurd and mischievous thing to advise people to take upon themselves the responsibility of putting their houses into a proper sanitary condition; that in every instance that has come under my own notice, a sense of security has been given which has afterwards been shown to be false; and I will add that no one, who was himself aware of the numerous pitfalls in the way of sanitary practice, would ever dream of giving such advice to householders.—I am, &c.,

W. H. CORFIELD, M.A., M.D. (Oxon.),
Professor of Hygiene and Public Health at University College, London.
10, Bolton-row, Mayfair, W., Jan 27, 1881.

MODERN DOMESTIC ARCHITECTURE.

SIR,—Mr. Davie, of Pembroke-gardens, Kensington, in his letter in your last issue, "deplores the numerous failures" made in the Queen Anne revival. He may well deplore them—such elevations for instance, as that of the Chiswick School of Art, with its corbelled-out pilasters, broken pediments, serrated wall-head, and badly-proportioned almost everything. The façade seems as if it was broken away at its extremities in the centre of a solid between two openings, showing weakness where, if anywhere, there ought to be strength. A design in the same style for the Liverpool School of Art (published in a contemporary), is not much better, with its pilaster resting on a window-cornice!

But why should a style, so free for all impurities, be selected for—of all purposes in the world—a *School of Art?* impurity meeting the student upon the very threshold. When our University buildings were designed, it was ably argued that the style ought to have been Classic; and for a building devoted to such a purpose as the teaching of Art, surely no style could be more appropriate than the noblest of all—the Greek.

Mr. Davie casts a longing and a loving eye towards the Gothic, and points out where, in London, some good modern examples may be seen. In Glasgow it would be eqully easy to point out admirable examples of Greek in buildings designed to meet modern conditions—churches, warehouses, town-residences, and in its neighbourhood, villas.

How is it that with all the perpetual talkee-talkee about "high art," there is no endeavour to revive in architecture the highest of all art?—I am, &c.,

DELTA.
Glasgow.

DISTRICT SURVEYORS.

SIR,—"That which in the captain's but a choleric word, in the common soldier is flat blasphemy." Excuse any slight verbal error in the quotation, as I am writing without the book.

A large red-brick building is in course of erection for an eminent firm in Bishopsgate-street, which is, I believe, the design of an eminent Queen Anne architect, and, being in the City, is under the supervision of an eminent District Surveyor. The moulded-wood window-frames are set within an inch of the exterior face of the brickwork, in clear contravention of the provisions of the Metropolitan Buildings Acts, which neither District Surveyor nor Metropolitan Board of Works are authorised to modify. What I want to know is, how it occurs that these eminent gentlemen break the law with impunity, whilst I and others of my calibre are pounced upon at once, if the slightest infringement of the rules of the Act is made by us?—I am, &c.,

R. FREEMAN.
Fenchurch Buildings, E.C., Jan. 25, 1881.

"THE WONDERFUL STOVE."

SIR,—When Mr. Burges has seen the above, I, in common with other of your readers, would be glad to hear his opinion of it.—I am, &c.,

JOHN P. SEDDON.
1, Queen Anne's Gate, Jan. 26.

HOTEL DE VILLE, BRUSSELS.

SIR,—Allow me to confirm your corsespondent "M.'s" able letter on the above drawing, in your issue of Dec. 24th, 1880, by Mr. H. C. Brandling.

I think he has done a good service by bringing to notice a *few* of the inaccurices most noticeable.

I have a photo taken in 1879, whilst the north portion was undergoing repair.

In the fifth paragraph of letter, p. 85 "M." speaks of the parapet at top as being different on the north of tower to that on the south—it is just the same; the only difference being the number of bays: on the south are five bays of two windows each; on the north are three bays, that next the tower of two windows; bay in the middle *three* windows; and bay next angle tower two windows.

To correct the drawing would take *too* much of your valuable paper, so I refrain; but will notice a few of the most glaring inaccuracies. To the left (south) of the hotel is a street Rue de l'Etuve. The drawing barely shows a court, and shows a house that does not exist. The proportion of the most *beautiful* Spanish houses on the right or north of market-place is bad; the beautiful architecture, sculpture, and gilding is simply spoiled; the market-place is so *un*faithfully represented that one would hardly think, from the drawing, the hotel stood on the top of a hill or incline.—I am, &c.,

F. A. BARTH.

Intercommunication.

QUESTIONS.

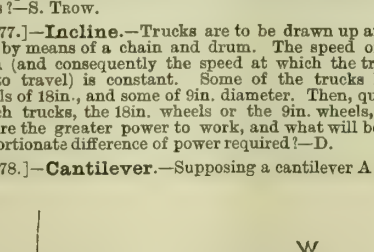
[6374.]—**Jacobean and Queen Anne Styles.**—Will some of your readers kindly give names of works, cost, and where to be obtained, of one or two inexpensive publications, with details of dwellings?—J. S.

[6375.]—**Asphalte Paths.**—Would some of the readers of the BUILDING NEWS kindly give me the proper method of making and laying asphalte suitable for garden-paths, yards, &c.? I have made several lots lately, but it does not set satisfactorily.—ASPHALTOS.

[6376.]—**Limestone Roads.**—Will some brother-surveyor kindly tell me if the rules given in Law and Clark's book on "Roads and Streets for Granite" are applicable to limestones, and where I can get a work treating on the construction and maintenance of limestone roads?—S. TROW.

[6377.]—**Incline.**—Trucks are to be drawn up an incline by means of a chain and drum. The speed of the drum (and consequently the speed at which the trucks are to travel) is constant. Some of the trucks have wheels of 18in., and some of 9in. diameter. Then, query: Which trucks, the 18in. wheels or the 9in. wheels, will require the greater power to work, and what will be the proportionate difference of power required?—D.

[6378.]—**Cantilever.**—Supposing a cantilever A B of



any section is required to carry a certain weight at its free end, but is found to be only equal to half that load; of what assistance would a cantilever, C D, of same section and material as A B, be if placed under the same, and connected therewith by a vertical strut or column? Would it have the effect of doubling the strength of A B, as would be the case if placed alongside that cantilever directly under the load?—SEVERN.

[6379.]—**Papering New Walls.**—I am about to enlarge some rooms of a dwelling-house, and wish to paper on the new walls as soon as completed. Would rendering in Portland cement and sand, and setting with Keen's cement, enable me to do so? If not, what should be done?—X. Y. Z.

[6380.]—**Wood-Carving.**—Would any reader kindly inform me of the best elementary work published on wood-carving, and also the tools, &c., requisite for a beginner?—REBUS.

[6381.]—**Refinement and Neatness.**—I read with much interest the above article in your number of 21st Jan. I cannot make any of my friends agree with me that delicacy and refinement does not consist in uniformity of brickwork and imitation mortar-joints. As I feel sure that the writer of the above article can enter into the feeling and spirit of the past, I am going to ask a question, an answer to which from him would confer an obligation. I am interested in an old mansion, date 1586—probably the finest in the county—but now in a most miserable state of neglect. It has been illustrated in Nash, Hall, and other works of that nature. It is brickwork, with stone-work in windows, doors, and angles. The brickwork is very rough and uneven, there is no uniformity in the general size of the bricks, and the mortar joints are very thick and irregular. To cover all this, about eighty years ago, the whole front was coloured; the last time was about thirty years ago, and it is now partially peeling off. How can the colouring be removed without injuring the original face? I mean the face as existing eighty years ago. It will require watchful care and no hurry. To scrape it would look miserable in the days of Queen Victoria, though, as a new building, it was, no doubt, a fine piece of work in the days of Queen Elizabeth. I want it cleaned and the ancient tone retained. A builder suggested a removal of the outer case of bricks and neat work put in its place between the stone-work. Of course, I dismissed him.—O. H. M.

REPLIES.

[6359.]—**Mathematical.**—The numbers 15, 12, 9, give the ratio of the sides of a right-angled triangle, and from this we get angle (a) = 36° 52′; (b) = 53 8, or using the formula cos. $A = \frac{AC^2 + AB^2 - BC^2}{2AC \cdot AB} = \frac{12^2 + 15^2 - 9^2}{2 \cdot 12 \cdot 15} = \cdot 8000$, and from this we get cos. Q = 36° 52′. If "Spon's" tables give only a table of natural sines, we can find the cosine, knowing that the cosine of an angle = the sine of its complement.—H. S.

[6361.]—**Sewage Sludge.**—"J. B.'s" question can scarcely be answered satisfactorily in the compass of the usual space devoted to queries. The manurial value of sewage sludge depends upon the percentage of nitrogen and phosphoric acid (I omit the potash, which is present only in small quantities). When sludge is obtained by simple subsidence from untreated sewage water, it may, if the road surfaces of the town are paved, and if storm-water is excluded, contain from 2½ to 3 per cent. of nitrogen, and nearly as much phosphoric acid when brought to an absolutely dry state. But there are few towns where the "separate system" is rigidly enforced, and where the sewage water is clarified by simple subsidence. We get the sludge, therefore, diluted or admixed with from 50 to 75 per cent. of road detritus, and, where lime is used as a precipitant, the quality of the deposit is still further degraded by the added lime. Sludge which may cost from 25s. to 30s. per ton dry to desiccate has seldom a theoretical value beyond 12s. to 15s., so that "J. B." will not be likely to receive many applications for his mud-heaps. When sludge, obtained from the treatment of the sewage-water, with a plentiful mixture of lime, is dried and calcined, it yields, as Gen. Scott has pointed out, a very good cement. The sewage of the town of Burnley (population, 50,000) is now being thus dealt with at a profit. There is a ready sale for all the cement made (about 12 tons weekly), at 38s. per ton. Many hundreds of tons have been made and sold during the past twelve months. The material is now being chiefly employed by the engineer of the Lancashire and Yorkshire Railway Company for engineering works. For further particulars "J. B." should apply to the manager of the Burnley Sewage Works, Duckpits, Burnley.—G. REDGRAVE.

[6363.]—**Choir-Stalls.**—In reply to "V. M.'s" question on above, I think I may safely say that these are the only two examples in either England and Wales where the westernmost stalls on each side cant on plan towards the NE. and SE. angles of chancel respectively.—FRED. J. FREEMAN.

[6364.]—**Flitch and Truss Beam.**—Add 30 times the thickness of the iron flitch to three times the breadth of the wood, both in inches, and the result × by the square of the depth in inches, and divided by the length of the bearing in feet will give the breaking weight in cwts. at the middle, thus:—$(\frac{3}{4} \times 30 + 3 \times 9) \times \frac{51^2}{4^2} \div 24 = 335$ cwt. approx., and this ÷ by 10 gives the working load = 33·5 cwt; also taking into account that the beam is trussed, a safe load would be about 2 tons.—H. S., Belfast.

[6368.]—**Bricklayers' Charges.**—No.—F.

[6368.]—**Bricklayers' Charges.**—The bricklayer cannot charge for rebuilding cellar walls if he has entered into a positive contract to perform certain work, unless an intention is expressed to the contrary. If the flood was an unexpected accident, and the work was carefully performed, the law apportions the consequences: the bricklayer is liable, before its completion, and he will lose his remuneration, and the owner loses his part of the contract. The law does not bind a man to do what is impossible, but a contractor is liable to rebuild any part which may fall or be washed away before its completion, so as to fulfil his contract.—G. H. G.

[6371.]—**Stone Work.**—No.—F.

[6372.]—**Architects' Charges.**—Yes.—F.

A bust in marble of the late Mr. Thomas Bassey, the contractor, has been placed in the apse at the south-eastern angle of Chester Cathedral, by his three sons, who also subscribed the expense of the renovation and decoration of this portion of the building during the general restorations under the late Sir Gilbert Scott, as a memorial. The bust, which was executed by Mr. Wagmuller, stands upon a red sandstone pedestal. The local work was executed by Mr. W. Haswell, under the direction of Mr. E. Tarver, architect.

Mr. Frank Dicksee, painter, and Mr. William Hamo Thornycroft, sculptor, were elected Associates of the Royal Academy on Thursday in last week.

WATER SUPPLY AND SANITARY MATTERS.

HOVE EDGE, NEAR HALIFAX, MAIN SEWERAGE.—The Halifax Union Rural Sanitary Authority having been called upon to undertake the main sewerage of this village in consequence of the defective state of the present sewers, tenders have been obtained, and that of Mr. Benjamin Roberts, contractor, of Low Moor, accepted for the works, from plans prepared by Mr. T. L. Patchett, Halifax, under whose superintendence the contract is being carried out. Tanking for settling purposes is arranged in Mr. Henry Westwood's plantation, some 200ft. below the pinfold, where the sewage empties itself from 18in. glazed earthenware pipes. This size of sewer is carried forward up the road past the pinfold, and through Mr. Crossley's property, until it reaches the turnpike-road, at a depth of 12ft., so as to allow for the branches from basements of houses, &c. A manhole is formed here, and 15in. sewers run right and left along the turnpike road. Branch sewers, 12in. and 9in. in diameter, are also carried up Green-lane, and the other side-roads adjoining the main thoroughfare of the village. Junctions are to be left at convenient distances for taking up the branch drains, manholes and ventilators being provided where necessary.

LEGAL INTELLIGENCE.

ARCHITECTS' CRITICISM ON ARCHITECTS.—The inquest at Devonport, on the body of Timothy O'Leary, a labourer, killed by the fall of a rubble-wall at the public-hall in course of erection in Fore-street, in that borough, was resumed on Monday. Mr. Samuel Knight, F.R.I.B.A., of Cornhill, London, the architect of the hall, deposed that he was in no way hampered as to cost in drawing the plans, and that when he last visited the building, on Oct. 26th, the wall which had fallen was about 42ft. high. He believed that the wet weather which prevailed during the last three weeks of the year was the primary cause of the accident. Mr. F. W. Barr, clerk of works, said he had inspected the works from the commencement, in May last, and was in every way satisfied with the way in which they had been carried out. He attributed the fall of the wall to the wet weather, but had had no reason to anticipate such an occurrence. In the eight or ten days before the fall of the wall, it was raised by about 14ft. Thomas Gower, the foreman of works, deposed to the good character of the rubble materials used in the wall, and the contractor, Mr. James Matcham, of Plymouth, added that he had not been hurried, and that he could not account for the accident. Mr. James Hine, F.R.I.B.A., of Plymouth, expressed an opinion that in the erection of a wall of this thickness and height, and without cross-girders or buttresses, it was undesirable to build in rubble. He should have had more confidence in brickwork of like thickness, because in rubble-work there were no horizontal beds, and some inequality arose from the different workmanship of the men employed. He found that the wall was built with the best flat-bedded lime-stone and Aberthaw, and that it was better bonded even than specified. That it should, under such circumstances, have fallen showed some error in judgment in the design. Possibly, if the wall had been carried slowly in stages 3ft. or 4ft. in height, and every stage had been allowed time for consolidation, the large overhanging cornice would not of itself have brought the wall down; built as it was, the masonry was comparatively "green," and the overhanging mass was the last finishing touch. The coroner (Mr. Vaughan) intimated that he had thought it his duty, in the public interest, to obtain an architect of considerable eminence to afford him assistance on technical matters. He did not wish to confine independent evidence to Mr. Hine, and if Mr. Knight, or anyone interested in the matter, desired to call further evidence of that character, he would grant an adjournment. Mr. Knight asked for an adjournment, because the evidence of Mr. Hine was entirely at variance with his careful calculations as architect of the building. He felt that a serious responsibility had been put upon him. The Coroner said the opinion in his own mind was that Mr. Hine did not reflect upon Mr. Knight's professional reputation, but that his evidence simply amounted to an expression of opinion that it might perhaps have been better had the work been proceeded with more slowly. Mr. Knight: But he challenges the design. Mr. Hine: I simply say a brick wall would have been better and safer than a rubble wall. Mr. Knight said this was a charge of "error in judgment," which he could not allow to go unchallenged; and, in order that he might obtain other evidence as to his design, he must apply for an adjournment. The inquest was then adjourned till Feb. 15th.

IN RE G. BROWN.—This was a first sitting last week in the Court of Bankruptcy (before Mr. Registrar Murray), for the proof of debts and the appointment of a trustee. The bankrupt had carried on the business of a builder in Bedfont-terrace, Fulham, and his statement of affairs returned unsecured debts amounting to £2,200; fully secured debts, £8,600; and assets, £2,300. Proofs for nearly £2,000 were admitted, and the creditors appointed Mr. John Vale and Mr. Robert Gifford, accountants, as joint trustees, with a committee of inspection.

IN RE BATCH.—The debtor, Jacob P. Batch, who has present a petition for liquidation, is a pavior and contractor, carrying on business in Camberwell-road, and he is also described as late of Bucklersbury, Walbrook, and Bishopsgate-street. Mr. Ditton applied last week, with the concurrence of creditors, that Mr. James Waddell, accountant, who had already been appointed receiver, should be also empowered to act as manager of the business, which was of an extensive character. The liabilites were returned at £22,000, and it was anticipated that the assets, if advantageously realised, would be sufficient to pay the creditors in full. The debtor was engaged in several contracts, and the petition had been filed by the desire of the creditors in order that the property might be protected. Mr. Registrar Hazlitt granted the application, and an injunction was also allowed to restrain several actions.

TOBIN'S VENTILATING TUBES.—RUSTON v. TOBIN.—This was an appeal at Lincoln's Inn, before Lords Justices James, Brett, and Cotton, from a judgment of Vice-Chancellor Malins dismissing with costs an action by the plaintiffs to set aside an agreement for the sale to them of the defendant's patent, and granting the defendant the relief asked by his counter-claim for specific performance of the agreement. The hearing of the case before the Vice-Chancellor occupied 14 days in February last, several witnesses having been examined, and the defendant having been examined and cross-examined at great length. The object of the action was to set aside an agreement entered into in April, 1876, by the plaintiffs, who were ten in number, for the purchase from the defendant, Mr. Martin Tobin, of his patent rights for an invention of an "improved mode of ventilating rooms," on the alleged grounds that when the agreement was entered into the patent was utterly void and had been frequently infringed, and that in order to induce the plaintiffs to purchase his patent rights the defendant had made fraudulent representations knowing them to be untrue, and had also concealed important facts which he ought to have stated to the plaintiffs at the time when they entered into the contract. From the decision in favour of the defendant the plaintiffs now appealed. The case occupied several days, and on Tuesday last their Lordships unanimously upheld Vice-Chancellor Malins' judgment.

CHIPS.

A pulpit, handsomely carved in Caen stone, with marble and alabaster tastefully introduced, has just been presented to Brigstock Church by an influential parishioner. It was executed by Messrs. Jones and Willis, of London and Birmingham.

The annual dinner of the Warrington Branch of the National Association of Master Builders of Great Britain was held on Wednesday week, the chair being occupied by Mr. R. W. Collin (the president for the year), and the vice-chair by Alderman Chandley (the vice-president). About 40 gentlemen were present.

The annual report of the Bristol Cathedral Completion Fund has just been issued by the dean and chapter. It states that the total amount expended has been £4,200. During the past year the principal work has been to provide doors to the west porch, and to complete the carving within the new nave and on the west front. It is now proposed to remove the chapter-house from near the west end of the cathedral, so as to allow of the formation of a court before the west front. When that is accomplished, an effort will be made to raise the south-western tower to the same level as that at the north-west angle, which will cost about £500. The architect is Mr. G. E. Street, R.A.

A vicarage is about to be built at Ambleside, from the designs of Mr. J. W. Grundy, architect, of Ulverston.

A Rogett memorial infirmary is about to be added to the Royal Albert Idiot Asylum at Lancaster. Messrs. Paley and Austin, of that town, are the architects.

The presentation of prizes to students in the school of art and design at Lincoln took place last week, when a report was read stating that in the National Competition, one of the four silver medals for oil-paintings, and 20 third-grade prizes were gained, and at the Government examination, 6 prizes and 30 certificates were gained by 75 students. The Gibney studentship of £20 for two years had been awarded to Oswald Lloyd. It was stated that the bad accommodation and over-crowding of the school was telling injuriously on the evening tatendance of students.

Our Office Table.

MR. JOHN J. CRAIG, of Knoxville, Tennessee, says that the United States Government has recently opened, and is now working successfully, a quarry of white stone in the immediate vicinity of that city, which is pronounced by competent judges to be superior to anything of the kind found elsewhere in the United States. It is a highly crystallised limestone marble—and as it comes from the hammer or chisel is almost perfectly white; when polished it shows a faint pinkish blush; long exposure to the atmosphere seems to whiten and harden it, a sort of glass-like enamel forming over its surface and rendering it almost entirely impervious to dampness and stains of any kind. A column of this marble which has been standing in Knoxville more than thirty years, and which has never been touched with brush or soap, is as white and clean to-day as it was the day it was first exposed. The texture is neither too hard nor too soft, but allows the sculptor to work it without extra effort, and trace on it the finest lines of finished form, and yet hard enough to retain these lines in all their original delicacy. The quantity of the marble is said to be unlimited. Knoxville is surrounded by whole mountains of it.

ONE of the indications of reviving trade (says the London Correspondent of the *Manchester Guardian*) is to be seen in the result of the operations of the Land Committee of the Metropolitan Railway. In the year of briskest trade in the past decade—1873—the sales of the large quantity of surplus land that company possesses were to the amount of £100,241, but the amount fell off, and for 1879 the amount of the sales was only £5,900. Last year an official but unpublished return shows that they increased to £19,206—larger than any year since 1876. Concurrently the rents of property let have risen, and there are less arrears carried forward. It is evident that more persons are investing in land and property in London, and the movement carried on this year will yield a still larger return to the Metropolitan Railway.

A LECTURE on "Water Supply and Filtration" was delivered by Professor Corfield at the Parkes Museum of Hygiene, before members of metropolitan building societies, on Saturday afternoon. The relative advantages of hard and soft waters for domestic use were compared, the preference being given to soft water, especially on account of its economy of soap for washing; and the Porter, Porter-Clark, and Atkins modes of removing the lime from hard waters were described. The constant-supply was universally admitted to be better than an intermittent one, and pressure had been brought on the metropolitan companies to provide it; it diminished the risk of unmanageable outbreaks of fire, and reduced the amount of domestic waste. But it had its dangers, for when the supply was turned off for repairs there was a possibility that the contents of water-closets would be drawn in by suction, as happened at Croydon, with the result of typhoid fever outbreaks. For pipes and fittings lead was the best and most convenient material; and the danger of lead-poisoning was infinitesimal. It was probable that in the future iron pipes, protected by a well-worked application of Professor Barff's discovery, would be largely used. Passing on to the subject of filtration, the lecturer denounced as unsound in principle the common practice by water companies of taking their supplies from rivers and other admittedly-contaminated sources, and then endeavouring to filter them. The downward intermittent method was the best mode of filtration, as it aërated the water, and its action was gradual. The various kinds of filters were described, the use of sponge being condemned as uncleanly. The lecture was illustrated by numerous specimens of exhibits in the museum.

THE following letter is one of the 175 applications sent in to the Corporation of Barnsley for the appointment of Borough Surveyor, and its reading at Tuesday's meeting of the Barnsley Town Council excited great mirth:—"January 15, 1881. H—— W—— offers himself as candidate for Borough Surveyor of Barnsley—having had great experience as builder in cheap and jerry line, would know all tricks of jerry builders, and would see good property was put up in Barnsley. Jerry building in Sheffield now does not pay, so having made a bit would leave

it 2 accept post of Borough Surveyor of your important and rapidly increasing town, which I have visited several times, and the air of which agrees me, also with my wife and five children, youngest of which is 4 years old. I would give the whole of my time to the job, and would accept £200 until you discovered my great capabilities, when I am sure you would give me the full salary. I used to be clerk of works for building firm until I went into the jerry building line (cottage), and should have done very well, but Sheffield is overbuilt with jerry property. I will look after your important town well, and catch them, knowing their tricks. I can wait on you any day this next week if appointment be made, and will give you reference to people here. — Your humble servant, H—— W——."

As the recent experience of Plymouth might be that of any town to which water is conveyed from any distance, it is worth while to consider the inconvenience to which the inhabitants of that town have been subjected by the frost. It has been shown that a few degrees of frost will stop the water supply of a town, and the plain lessons of this emergency should not be overlooked. During the great drought of 1864, when the Bristol water supply was stopped for some weeks, the Local Board of Health erected pumps in various parts of the city, and these we believe have been allowed to remain, the handles in the mean time being removed. These pumps, scattered over the city, could, if required, be brought into immediate use, and constitute a second source of supply. Where no similar second supply exists, it might be possible to drive a few Abyssinian tubes in various districts and work them by steam-power. In a seaboard town like Plymouth, had the worst come to the worst, sea-water might have been condensed, and a partial supply thus obtained; but an inland town would have no such last resource to fall back on.

THE Sanitary Engineering and Ventilation Company, of Victoria-street, Westminster, have lately introduced a modification of their patent air-cleansing water-box in combination with a wall bracket for drawing-rooms and boudoirs, &c., which has many advantages. The bracket (which is designed either for a flat wall or a corner) is made large enough to carry a bust, a vase of flowers, or other ornament, behind which the current of purified air ascends vertically, and without damage to the ornament or to the decorations of the room. A valve is provided for controlling the supply, and the incoming air may be perfumed at will by putting a spoonful or two of scent in the water-box.

THE eminent American civil engineer, General Charles B. Stewart, died in Cleveland, Ohio, January 4th. General Stewart was engaged in the construction of the Philadelphia, Wilmington, and Baltimore Railroad, one of the first railroads in the country built for passenger service. Subsequently he constructed the Brooklyn dry docks, displaying therein an ability which secured his appointment as Engineer in Chief of the U.S. Navy. His volumes on naval architecture, the construction of dry docks, &c., attracted wide attention at home and abroad, and gained him much distinction at the hands of foreign authorities. He was for one term State engineer of New York, and deserves much of the credit for the first Niagara suspension-bridge.

ONE of Messrs. Barnard, Bishop, and Barnard's slow-combustion stoves, on exhibition at the Alexandra Palace, deserves notice, from the beautiful overmantel which surmounts it being made of the new wood, sequoia. The tree from which this wood is derived grows in the same forests and is closely allied to the *Sequoia gigantea*, popularly known as the Wellingtonia, one of the largest trees of the world. From the natural order *Cupressinæ*, to which it belongs, the most ancient examples of woodwork, recorded and extant, have been derived. On fallen trees of *S. gigantea* 1,500 annual layers have been counted, and Professor Asa Gray considers it probable that close to the heart of living trees may be found the circle that records the year of our Saviour's nativity. In the country of its growth the wood of *S. sempervirens*, applied to numerous purposes, is in high repute for durability below, upon, and above ground. Having the warm tone of cedar, without the overpowering odour of that wood, and a varied aspect, from plain linear forms to the most beautifully diverse figure, it is applicable to ornate work in ecclesiastical and domestic architecture, and is especially suitable for panelled interiors and furniture.

A VACANCY in the Royal Academy has been created by the death of Mr. Alfred Elmore, R.A., on Monday last. Mr. Elmore was 66 years old, having been born at Clonakilty, in the county of Cork, in the year 1815. He exhibited his first picture at the Academy so long ago as 1834. Two of his earliest pictures, "The Crucifixion," exhibited at the British Institution in 1838, and "The Martyrdom of Becket," which was on the walls of the Academy in 1839, are now in a Catholic church in Dublin. His greatest successes were won in his historical or semi-historical painting. The "Origin of the Guelph and Ghibelline Quarrel" (1844), his first important picture of this kind, was sold for £300, and gained him his entrance as an Associate into the Royal Academy. This was followed by the "Fainting of Hero" from *Much Ado about Nothing*, in 1846; "The Invention of the Stocking Loom," in 1874, a picture which achieved great popularity; "The Death-bed of Robert King of Naples, Wise and Good," in 1848; "Religious Controversy in the time of Louis XIV." in 1849, "Griselda" in 1850, and "Hotspur and the Fep" in 1851, among other pictures. Mr. Elmore was elected an Academician in 1877. His funeral takes place to-day at Kensal-green.

WE hear that it is proposed to hold another Exhibition of Fine Art in the Royal Albert Hall in May next, which will consist, as before, of works by British and foreign artists, architectural drawings, sculpture in marble or other material, terra-cotta, engravings, &c. All works intended for exhibition must be delivered at the Royal Albert Hall, free of all charges, including carriage, on the 22nd and 23rd of April, accompanied by a letter addressed to manager, describing the work as it is intended to be described in the catalogue. All paintings and drawings must be suitably framed; copies are not admissible. A committee of selection will be appointed, but artists are not restricted as to the number of works sent in. A commission of 7½ per cent. will be charged on all works sold.

Epps's Cocoa.—Grateful and Comforting.—"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette*.—Sold only in Packets labelled—"JAMES EPPS and Co., Homœopathic Chemists, London."—Also makers of Epps's Chocolate Essence for afternoons

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill. *Use no substitute* —[ADVT.]

Holloway's Ointment and **Pills** exercise priceless power over lumbago, all pains of the muscles, nerves, and joints, and quickly reduce all swellings caused by accidental injuries, weakness, or hereditary taints. The intelligible instructions enveloping Holloway's medicine give full counsel for using it most advantageously for regaining health, strength, and mobility.

CHIPS.

A fine-art loan exhibition is on view at Horncastle, including a large display of oil and water-colour pictures, china, ivory carvings, and cabinets of bijouterie.

At a local board meeting held at Luddenden-foot near Halifax, on Friday, Mr. S. Utley, C.E., of Halifax, was instructed to prepare plans for the rebuilding of the bridge over the river Calder.

At a meeting of the Acton Local Board, held on the 11th inst., Mr. Henry Monson was unanimously elected assistant-surveyor, out of 91 candidates for the office, at a salary of £150 per annum.

A new Primitive Methodist chapel was opened at Dunton Bassett on Sunday week. Mr. Wilson, of Huncote, was the builder.

Works of sewerage are about to be carried out for the Rugby rural sanitary authority in the villages of Long Lawford and Brinklow, at the estimated costs of £3,000 and £750 respectively. Mr. Parnall is the engineer.

The town-council of Denbigh held a special meeting last week to appoint a borough surveyor, when Mr. John Daives, who had just previously resigned his seat as a member of the council to become a candidate, was elected.

The new docks at Sutton Bridge, in the Wash, were completed last week after two years' labour, and a supper was given to the navvies in celebration of the event. Messrs. Benton and Woodiwiss, of Derby, were the contractors.

An inquiry was held at Scarborough on Friday, before Mr. Robert Morgan, C.E., an inspector of the Local Government Board, with reference to an application from the corporation for sanction to a loan of £15,850 for works of new sewerage rendered necessary by the rapid increase of the north-western district of the town, and for minor street improvements. The plans were explained by the borough surveyor.

At the late meeting of the Whitechapel district board of works, the death of Mr. S. W. Iron, for 10 years surveyor to the board, by a fall down the steps while entering his own house, was announced, and Major Munro, the representative at the Metropolitan Board of Works, in moving a vote of condolence with the family, expressed reprobation of the "indecent haste" with which a candidate for the appointment had sent out canvassing circulars.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW.) — St. Paul's Ecclesiological Society. Annual meeting. 2 p.m.
Architectural Association. Visit to Standard Assurance Office, King William-street, E.C. 3 p.m.

MONDAY.—London Institution. "The Thing that Might Be." By Rev. Mark Pattison, B.D. 5 p.m.
Royal Institute of British Architects. "Persian Architecture and Construction." By C. P. Clarke. 8 p.m.

TUESDAY.—Institution of Civil Engineers. Discussion on "Deep Winning of Coal in South Wales." Paper on the "Portsmouth Dockyard Extension Works." By C. Colson. 8 p.m.
Society of Arts. "The Industrial Products of South Africa." By Sir Bartle Frere. 8 p.m.

WEDNESDAY.—Society of Arts. "Trade Prospects." By Stephen Bourne. 8 p.m.
British Archæological Association. "Exploration of the Roman Villa at Bromham." By W. H. Butcher, of Devizes. "Recent Excavations in the Troad." By Dr. J. S. Phene, F.S.A.

THURSDAY.—London Institution. "Three Years of Daily Weather Forecasting." By R. H. Scott, F.R.S. 7 p.m.
St. Paul's Ecclesiological Society. Annual Dinner.
Civil and Mechanical Engineers' Society. "Draining and Embanking with Regard to River Outfalls." By William C. Street. 7 p.m.

FRIDAY.—Architectural Association. "The Sanitary Work of an Engineer." By E. Turner. 7.30 p.m.
The Institution of Civil Engineers. "Boilers." By W. Marriott. 7 p.m.
Royal Institution. "Modern Spectroscopy." By Dr. Schuster. 9 p.m.

SATURDAY.—Parkes Museum of Hygieae. "Drainage." By Rogers Field. 3 p.m.

Doulting Freestone and Ham Hill Stone of best quality. Prices, delivered at any part of the United Kingdom, given on application to
CHARLES TRASK,
Norton-sub-Hamdon, Ilminster, Somerset.

ISAAC SUMSION, NEWARK STREET, **BATH.**

Quarryman and Stone Merchant. Established 1791. Prices, delivered to any part, furnished on application. —[ADVT.]

WANTED.

WANTED, a Situation as Assistant in an Architect's Office. Passed the R.I.B.A. Preliminary Examination, 1880; also Science and Art Examination in Advanced Architecture and Building Construction, and holds full Drawing Certificate. First-class references.—S. H. D., Manor-place, Hale, Farnham, Surrey.

ADVERTISER (25), thoroughly Practical and Competent, seeks a Situation as Assistant Surveyor, Clerk of Works, Builder's Assistant, or otherwise; excellent references. Terms, £2 per week.—P. M., Messrs. LOWE and Co., 38, Bishopsgate-street Within, London.

ADVERTISER requires Situation as Junior Assistant; four years' experience. Working Detail and Perspective Drawing, Draft Specifications, Measuring, and General Routine.—Address, W. H. C., 2, Avenue-place, Tuddenham-road, Ipswich.

WANTED.—A PARTNER with £750, to take a Share in a Patent connected with the Building; splendid contracts in hand.—"AIX," 29, St. Stephen's-road, W.

ASSISTANT WANTED, must be Good and Expeditious at Constructional Details, General Office Work, and Perspective.—Apply, stating terms, to JAMES SEWARD and THOMAS, Architects, Cardiff.

AN ARCHITECT'S ASSISTANT desires an Engagement; unexceptionable references; terms moderate.—Address "ASSISTANT," care of Messrs. Hetherington and Oliver, Architects, Carlisle.

DESIGNER, First-class, Seeks EMPLOYMENT; thorough knowledge of Style, Details, &c. Terms moderate.—Address, Mr. GEOFFREY, St. Ives, West Hill, Sydenham.

DESIGNER of FIGURE and ORNAMENTAL DECORATION, STAINED GLASS, HERALDRY, and all kinds of Artistic Work in the Mediæval and Classic Styles; can also execute the same; highest references; offers his services.—L., 29, Gladstone-street, Southwark, London.

WANTED, a SITUATION as Managing Assistant, in London or Provinces; twelve years' experience. Highest reference and testimonials.—Address by letter, "ARCHITECT," 32, Clissold-road, Stoke Newington, London, N.

THE ADVERTISER, who has had 20 years' experience in the profession, 12 years of the time as Managing Assistant to one of the leading Architects in London, and three years in practice, wishes to occupy his spare time in preparing Sketches or other work for architects at his own office.—M. B., C. H. Job and Co., 40, Upper Thames-street, E.C.

ARCHITECT'S ASSISTANT seeks ENGAGEMENT; well up in Working, Detail, and Pen-and-Ink Drawings.—Address, A. B., Vicarage, Andover, Hants.

GOOD, QUICK DRAUGHTSMAN requires SITUATION in London immediately. Working Detail, Perspective Drawings (Gothic and Domestic); 9 years' varied experience; good correspondent; specimens sent.—H., 11, Lime-grove, Shepherd's Bush.

AGE 19.—ASSISTANT (Architect and Surveyor's), with practical experience, seeks ENGAGEMENT; three years with present employer; satisfactory references.—Address, B POTTER, 50, Chetwynd-road, Dartmouth Park Hill, N.W.

CONCRETE BUILDING.—WANTED, a respectable Builder or established Company to undertake, as a SPECIALITE, or in connection with a similar Business, a new System of Building in Concrete (which has been amply tested in practice), and to bring the same before the notice of the public. Patentee's time being entirely occupied otherways, he has no opportunity of developing or pushing the invention. Remuneration to depend wholly upon profits. Principals only communicated with.—Address, S. S., care of May's, 169, Piccadilly.

THE AYLESFORD POTTERY COMPANY are prepared to supply GAULT BRICKS, ROOFING, and RIDGE TILES (plain and ornamental, red and dark), SALT GLAZED STONEWARE DRAIN PIPES, CHIMNEY POTS, AGRICULTURAL PIPES, &c. in Trucks at Aylesford Station (S.E.R.), or in Barges at the Works.

For Prices, &c., apply to THOMAS STANFIELD, Aylesford Pottery Company, 158, York-road, Lambeth; or to JOSEPH HAMBLET, at the Works, Aylesford, near Maidstone, Kent.

THE BUILDING NEWS.

LONDON, FRIDAY, FEBRUARY 4, 1881.

THE MANAGERS OF METROPOLITAN BUILDING.

THE chief managers of Metropolitan building, under the various Acts passed to regulate it, are the Metropolitan Board, the Board's officials, and the district surveyors. The chief objects of the Acts are to insure safety from fire, security of construction, convenience for traffic, a certain amount of regularity in street frontages, and freedom from gross sanitary defects in buildings for public use or habitation. The intentions are excellent, and the regulations on the whole have done, doubtless, more good than harm. There is plenty of room for improvement, however, not only in themselves, but in the way in which they are carried out, and the BUILDING NEWS, being on this subject an independent journal, can speak freely and plainly both of the regulations and the regulators. Of the latter: the district surveyors are those with whom everybody who has to do with London building is most frequently concerned. Amongst their number are men of culture and ability, of whom we should wish to speak with all respect, even when we are compelled most fundamentally to differ from them. But along with them are also, unhappily, men of no culture, and no ability beyond the low and narrow capacity which, for the most part, is all that their routine business requires. An elementary knowledge of construction, a slight acquaintance with the strength of materials, and a close familiarity with the working of a few Acts of Parliament and the regulations appertaining to them, are found in practice to be a sufficient passport to the dignity and emolument of a district surveyor. The qualifications are so common, or so easily acquired, that it is no wonder the applicants are about fifty times as numerous as the offices. On what principle the selections are made it would be difficult to say; but they are not apparently influenced by high attainments or by professional reputation. Here and there, as we have said, these things have proved no hindrance to a district surveyorship, but it is doubtful if they have proved a help to it. The mechanical drudgery of the duties, too, has few attractions to a first-rate man; and while these duties remain what they are, the Metropolitan Board can hardly be blamed for not trying oftener to "cut blocks with a razor."

The misfortune is, however, that along with the want of high capacity is apt to go a certain want of refinement and consideration, which makes those who suffer from them unpleasant people to deal with; that the less respect they are personally entitled to, the more deference they frequently insist on when placed in office; that moral excellences do not always exist to compensate for intellectual failings; and that the conditions under which district surveyors work tend strongly to aggravate all these evils. The district surveyor is paid, not by a salary from any public fund, but by fees from the very men whose work he has to regulate. It is as if an architect, though appointed by his client, should be paid from first to last only by the contractor. The very danger which the Institute has so constantly and properly set its face against—the existence of a money relation of any sort between architects and the contractors who work under them—here shows itself in full force. In this fact there is such a plain and palpable opening for malpractices, that even were there, in no case, the least real ground for suspecting them, it would be impossible to keep out slander and suspicion. Supposing, however, that malpractices ever do exist, they must clearly be very difficult of detection. A little liberality in the calculations by which fees are decided—a little consideration for the surveyor's interest in agreeing as to which are or are not to be looked upon as separate buildings on the same site, will make matters pleasant without a resort to anything so indelicate as open bribery or corruption. On the other hand, it is nobody's business to inquire into the little advantages which the builder or building owner may get in return for these concessions. Further, it is not usually respectable contractors, but speculators of the lowest class, who chiefly want to evade the Building Acts, and the tendency—though, of course, we do not say the usual result—of the present system is to establish close relations between this lowest class and the district surveyor. The worst sort of building, therefore, is that which tends to be surveyed most leniently; while the best class, as we shall see directly, is not unfrequently visited with the utmost rigour of the law. For the district surveyor, unhappily for the public, is not confined to the duties of his office, though in many districts they would more than employ all his time and energy. He is allowed, in addition, to carry on a private practice, which may be a large one, and which, in many cases, has at least large results. His interest—and it will be remembered that we are speaking throughout of the natural interests under the present system, and not of the way in which honourable and high-minded men may rise above them—his interest is so to use his powers that no architect but himself can practise in his district without perpetual vexation, annoyance, and delay. The scamped house-building of third-rate streets is done without architects, and the district surveyor has no interest in making difficulties there; but in the best class of houses, and in public buildings almost without exception, architects are employed, and in dealing with these he has both the temptation to, and the opportunity for, gross unfairness. It is his interest—and experience points to the conclusion that in certain cases it is his aim—to shut all outsiders out of his district, and to engross as much as possible of its architectural practice himself. The powers entrusted to him may be twisted into admirable means towards this end. Public buildings in London have to be constructed to the satisfaction of the district surveyor—with power of appeal, if anyone thinks it worth while to make an appeal, to the Metropolitan Board of Works. The Metropolitan Board is only a magnified parish vestry, guided by the advice of a superintending architect, who is only a magnified district surveyor. We intend no disrespect to the present occupant of the office, but this is what it naturally makes of all who fill it. In practice, therefore, the power of appeal does not usually count for much, and we are thrown back on the district surveyor. When he deals with a public building, he can first find any number of faults with the proposed construction; he can next spend almost any amount of time in insisting on alterations and arguing about them; and, finally, he can cause the outlay of a large amount of money in effecting the alterations he insists on. Thus he can first discredit the intruding architect as a bad designer; then he can bring him into ill repute with his clients as a waster of time; and, lastly, he can make him notorious for running into an extravagant quantity of extras. We ought to add that he can wind up by appropriating in buildings of his own as many of the other architect's ideas as he cares about, since, by a recent regulation, he is entitled not merely to examine, but to keep, a complete set of the working drawings. With all these points in his favour, it is strange, indeed, if he does not often have an advantage over his competitors; and if cautious people in his district do not prefer to employ him personally, with the hope of saving both time and money. It is to the credit of district surveyors as a body that all this does not happen more conspicuously and frequently, but it is an intolerable disgrace to the system under which they work, that it should be possible for it to happen at all.

We may give an example, by no means imaginary, of the sort of way in which the present system *can* be worked, and of the class of men who *can* obtain and keep for many years the appointments in question. In a locality famed all over London for the badness of its low-class house-building, the public superintendence is done by two persons whom the scoffers of the neighbourhood have named "Pomp and Vanity." Mr. Pomp, an elderly man of vast pretentiousness, is the district surveyor; and Mr. Vanity, a younger person of infinite conceit, is his managing clerk. Intrinsically, Mr. Pomp differs little from a clerk of works of the old school, with his "Peter Nicholson," his "Builder's Jewel," and his indispensable bust of Michael Angelo. The only noticeable work he has ever done is to interfere with the work of other people; and if you are an architect, you would not admit him as a clerk into your office, even if he asked no salary. In the course of business, you send him the drawings for a public building to be erected in his district, and he makes an appointment to see you. Pomp sits in dignity in his arm-chair, and treats you as if you were a schoolboy come to say a lesson. Vanity stands behind him and prompts him, holding a list of objections and complaints numbered from 1 to perhaps 50. As each objection is read out, Pomp enlarges on the depravity which must have produced the thing objected to, and then turns up his head and looks at you out of one eye, like an intelligent jackdaw. If you defend your work, he offers you a hundred times over an appeal to the Board of Works, and threatens you every five minutes with a summons before the magistrate. It is of no use quoting principles or precedents; he tells you beforehand that nothing will convince him. Adopt his alterations you must, or oppose them before the Metropolitan Board. There is little benefit in appealing to a body with no technical knowledge of the questions at issue, or in exposing yourself in the process to more officialism, more pretentiousness, and more manners as graceful as those of Mr. Pomp himself. You agree to the alterations, in the hope of saving time, and in the despair of saving money, do what you will. Business settled, Mr. Pomp gives you a little paternal advice; criticises your style of drawing, and brings out as an admirable model for imitation, an inch-scale drawing of a kingpost roof. "This," he says, as he recalls to your memory the first labours of your articleship some thirty years ago, "this is the way in which you should learn to get out details; this shows the manner in which the true architect explains his designs." Perhaps, poor man, he does not really mean to insult you; to him a kingpost roof is the crown and flower of all construction; he could do nothing more original himself; he can imagine nothing more original done by others, and his idea of an architect is that of a man who spends his time in drawing neatly, what any carpenter can make without drawings at all.

The construction settled, you proceed with the work. You have a first-rate contractor, and the best materials that can be

bought for money. The structure, as it rises, looks, in comparison with the jerry-building of the neighbourhood, a marvel of firmness and solidity, but you are stopped at every step. There is not a clause or a regulation under which you do not get a complaint, a letter, or a threat; and though you may prove, nine times out of ten, that the clauses and regulations do not apply to the case in question, you have the trouble of correspondence and the annoyance of delay. The foreman cannot draw a brick from the wall or take up a board from the floor without a notice from Mr. Pomp, that the building is being rendered insecure, till at length some new intruder withdraws his attention from you, and you are left to build better or worse at your pleasure. In the mean time, at every visit to your building, you have watched with awe and interest the shops adjoining it. The walls are so weak, the supports are so thin, and so manifestly out of the upright, that you instinctively speak in a whisper as you pass them, like Alpine climbers who hold their breath for fear of bringing down an avalanche. If Mr. Pomp has been so hard to please about your own solid and substantial building, what imaginable means could have induced him to allow a ricketty house of cards like this? You delicately ask as much of the owner next time you see him, but he only answers, with a significant smile, "Mr. Pomp is a very nice gentleman." If you are wise, you inquire no further into mysteries that do not concern you. Your own treatment, after all, might have been worse. It is not worth naming, people tell you, in comparison with that which Mr. X. had to put up with. He and Mr. Pomp competed not very long since, for an important work in the latter gentleman's district, and Mr. X. gained the competition. It was a "public building," and Mr. X. had to submit the drawings to Mr. Pomp for his approval; a succesful competitor compelled to ask a beaten competitor for his approval of the design which had beaten him! Language cannot adequately paint the situation, and we should in vain try to describe, even if we fully knew, all Mr. Pomp's endeavours to find expedients equal to the case. We leave the details to the moralist or the satirist who wishes, for once, to make an exhaustive study of the meanest side of human nature.

We repeat, again, that we have not described Mr. Pomp as an average specimen of the London district surveyor. But we also repeat that it is a public disgrace that it should be possible for any specimen such as this to occupy such an office, and that there is something radically wrong about the system which permits it. More than this, there is something yet more grossly wrong about the system which tends to make men into this type, which tempts them, if it does not persuade them, to wink at bad building and raise frivolous objections to the good; to neglect public interests, and gratify private exclusiveness, not to mention private spite. Let district surveyors, by all means, be well paid; but by no means let them be paid by the very men they are appointed to watch over. Let them continue, if no better plan can be found, to inspect and decide in the first instance on the construction of public buildings; but let their whole time be devoted to official duties, and not to the keeping of their districts as close preserves for their private practice. Let such scandals as that of a defeated competitor, revenging himself by the help of his official position on a successful one, cease at once and for ever; and let there be a real appeal from every district surveyor's decision to an able, impartial, and thoroughly unconnected tribunal. Lastly, if it is not too much to ask, let not only some few, as at present, but let every manager of Metropolitan building make an effort, in his transactions with other architects, to conduct himself like a gentleman dealing with gentlemen. Art, we have long ago heard, softens men's manners and renders them less savage. If there is any truth in the assertion, it is painful to think what the manners of some Building Act officials might have been had they adopted a career that brought them into no relations with the artistic.

THE NEWBURY GRAMMAR-SCHOOL COMPETITION.

No less than 58 sets of drawings have been received for the Newbury grammar-school, and these have been exhibited during the last week on screens in the large room in the Town-hall, Newbury. As was intimated in the particulars furnished to competitors by the secretary, the trustees have availed themselves of the advice of Mr. Waterhouse, and that gentleman has made known the result of his labours to the trustees, having awarded the design with motto "Industria Omnia Patent," by Messrs. Power and Hughes, of Leadenhall Chambers, the first place, and the design with motto "Collegiate," by Mr. C. H. M. Mileham, of Gower-street, London, the second premium. A glance at the plans shows a general agreement as to the position of the chief divisions of the building, which had to comprise a school-room to accommodate 200 boys, with three class-rooms and conveniences; a dining-hall to seat 80, with kitchen offices to answer also the purposes of the head-master; dormitories for 40, and master's residence. It was also necessary to bear in mind the provision for future extension. We find, in the large number of plans, a front building facing the Enborne-road, with two or more buildings in the form of cross wings. In many plans the schoolroom has been placed on the east side, and is made to form a return-block, with the class-rooms and dining-hall in the front building, and the master's house on the west side, and there are undoubted advantages in this location as regards lighting and aspect; but in some designs this arrangement has been reversed. Either end is suitable for the house, and some very good plans show it at the east side. A few plans are based on the quadrangle. It is, however, of fundamental importance that the assistant-master's room should occupy a central position, so as to command a view of the school, dormitories, and playgrounds, that the class-rooms should be near to the school, and the dining-hall to the kitchen, and that the entrances should be convenient, and close to the cloak-rooms and lavatories. Further, it is required that the boarders and their rooms should be arranged as much as possible so as not to encroach on the day-scholars' quarters; that the master's house should be self-contained and easily separated; and that the rooms and corridors should be spacious, well ventilated, and lighted. In many of the plans we find the main corridor connecting the school with the class-rooms, dining-hall, and house, is placed on the inner side, which has the effect of preventing a cross-ventilation through the main rooms and dormitories, and in some cases it is made excessively long, without sufficient light in parts that should be well-lighted; while, in others, space has been wasted in useless passages. The stairs should be centrally placed, and near the main entrance, and this has been adhered to in most of the plans.

As regards architectural treatment, the designs are various, though it is pretty evident that the intention of asking Mr. Waterhouse to advise has influenced a large number of the competitors to adopt the Gothic which is most in favour with him, and, perhaps, for scholastic buildings of this kind, the Tudor or Domestic Gothic buildings of the 16th century supply very suitable models. A few Queen Anne and Classic designs are, however, seen, though many of these appear to indulge in expensive features. Of suitable Renaissance we find scarcely one good example, and the best designs in the present instance are in Late Gothic. Many of the drawings exhibit a large amount of skill and study in their preparation; one or two we noticed have rather exceeded the instruction as regards colour.

We can only afford space to notice in detail the chief designs. Beginning with "Industria Omnia Patent" (by Messrs. Power and Hughes), we have no hesitation in at once admitting it to be a well-planned and economical design, bearing indications of study. The authors have placed their building to face the north or Enborne-road, leaving in the rear a large area as a cricket-ground, and giving to the head-master's house a south-western aspect, a disposition which seems favourable, and one suited to the level and site. The design is shown by an ink perspective sketch. Late or 16th century Gothic, of English character, has been adopted, and the front, which will occupy a commanding position, consists of a central entrance, carried up three stories, and finished as a gable, a gabled school on the east side forming a wing at right angles to the front, and the master's house the corresponding side. The features are plain, and the grouping and details bear a scholastic character, while the three main divisions of school, class-rooms, and residence have been kept in view, and made distinctive features in both the plan and design. The fronts are of red brick, with stone or terra-cotta dressings. As in many other plans, the usual disposition of buildings has been adopted; a range of building with two cross wings, or ⊔ shaped. The school, which forms the east wing, and is only a one-story building, is 65ft. by 27ft., and its height to the springing of roof is 16ft. It is well lighted by side-windows on the east, and by two end windows of Perpendicular character. The main longitudinal corridor, which connects the school with the other portion of the building, forms a good entrance, and communicates with two class-rooms in front, while a back corridor, running at the side of school, forms an entrance into the playground, and gives access to another class-room, which is built out behind. It would have been better to have reversed the arrangement of this part by putting the day-scholars' hat-room and lavatory where the class-room is, near the back entrance. The class-rooms are convenient in position: they are each 20ft. 6in. by 18ft. 6in., have long desks to accommodate forty boys, and are well lighted by wide windows to the left of the pupils. The dining-hall forms a corresponding wing on the west side of the entrance, and measures 40ft. by 18ft. 6in., with a bay-window in front, capable of seating 90 boys. It is in convenient proximity to the kitchen offices of the master's house, and the service arrangements, the china and store closets have been considered. Near the centre entrance, and commanding the corridor, is a sitting-room for the under-master, and opposite the entrance, forming a projection behind, is the main stairs, with a lavatory and w.c. below it, well ventilated and communicating with a covered playground for the use of the boarders. In the house arrangement, the kitchen is well placed, not only near dining-hall, but master's room; but perhaps the latrines and covered playground would have been better if placed on the other side instead of being so close to the domestic offices, and the library-door put in a more retired position. On the first floor are the dormitories. One, 34ft. by 24ft., divided into 12 cubicles, is placed at the school end,

and two others 41ft. 6in. by 18ft. 6in., occupy nearly the entire floor along the main-front, each comprising 14 beds, or over 600 cubic feet per boy. The assistant-master's room is placed between these, commanding the dormitories, and the lavatories are also central, opening into each of them. Bath-rooms and w.c.'s are over those below, and occupy the upper landing. The housemaid's closet is well placed; the corridors are 5ft. wide and well lighted, and the authors show openings for light and air on the inner side of dormitories. These are obtained over the roof of corridor, and furnish, with the front windows cross ventilation. Generally, we find the details fairly worked out; hollow walls are proposed, the closets and soil-pipes have external positions, and the heating and ventilation have been considered. Boyd's stoves are provided to supplement the open fireplaces. The estimated cost is £7,000, the school and class-rooms, dining-hall, &c., being calculated at 6d. a cubic foot, the dormitories at 5d., and the master's house at 7d.

"Collegiate" (by C. H. M. Mileham) is certainly less satisfactory, though its author has correct notions of school-planning, and is one of the architects who occasionally takes the place of the architect to the Privy Council on Education, and to the Charity Commissioners, according to the description accompanying the design. The pencil sketch shows a very plain, thoroughly domestic, treatment in Late Gothic. The squat entrance-tower and cupola, and grouping, the open-timbered covered play-shed, and the details have an almost picturesque homeliness about them, and not very much to put one in mind of a modern collegiate establishment, and the author has clearly taken one of the old types of English buildings for a guide. In plan the tower forms a bold-arched gateway or entrance; on one side are the school and class-rooms forming a compact block of building, entered from the gateway, and having a corridor between the school and the three class-rooms. The school, lighted from the front, is 52ft. by 20ft., and has three ranges of seats for 40 boys each; the hat-and-cloak room forms a lobby entrance on one side, and the class-rooms are planned on an approved model close to the school-room and well lighted, with angle fireplaces. We much doubt whether the school-room is quite large enough for assembly purposes. On the left of entrance is a dining-hall 33ft. by 20ft. for 80 boys, with a bay window, a servery conveniently placed, and lastly the master's house forming the end of the range, the offices extending in the rear and making a long wing terminated by a wash-house and laundry. Behind the school block is a covered playground and a fives-court; the staircase forms a semi-octangular projection near the entrance, and the assistant-master is well placed. The first floor plan is less satisfactory; the house and dormitories strike us as drawn out to an inconvenient length, and the position of assistant master's bedroom would hardly afford him the supervision he ought to have over the two dormitories which are placed at right angles over the school end. The partitions of wood dividing them are not desirable, and the lavatories and bath-rooms look cramped. The dormitory with 12 cubicles is well placed on the other side of the master's room, and the store-room is central. We should have thought one nursery sufficient and a little more lavatory space useful. In the house arrangement, economy has been considered in the kitchen and serving to dining-hall; but the offices at the back make an unnecessarily long wing, and the planning of reception-rooms is not satisfactory. We prefer the site plan, No. 2. The estimate is £7,022.

We intend to illustrate both these designs. "Newbury" is shown by a large ink perspective. It is a Gothic design, broadly treated, with pleasing grouping, and some good detail in the elevations; but the author rather exceeds the requirements in the plan, which forms a quadrangle, with open centre court and corridors round. The residence, dining-hall, class-rooms, and playground form respectively the four sides; but the schoolroom is too long, and is over the classrooms, a decided objection. "Postulata," by Mr. J. H. Money, of Newbury, is a boldly drawn ink design in Late Gothic, rather modernised in treatment. The main objection to the plan is the length of schoolroom, which is 110ft. by 24ft. It forms a single-story wing; the house forming the other. The intervening building in front has the classrooms and an inner corridor, which connects the school and house. "Falkland" is a striking set of drawings in an expensive palatial style, calling to mind the Elizabethan front of Wollaton House, which apparently served as a model, and there are few good points in the plan, which is broken up by bays in a rather profuse fashion. "Utilitas" is a clever pencil-sketch in outline, with a touch of French Gothic, freely handled, having a lofty double-stage spire over entrance. The plan lacks economical distribution of parts, which are put together in a random kind of manner; but the chief defects are the position of the classrooms and lavatories: the former are too far from the school, and the latter from the entrances. "Experientia" (we are told the design of Messrs. Giles and Gough) has many good points. The main building, drawn in a Late Gothic style, is shown with three stories. A florid centre entrance, finished as a gable, has some good French detail about it, though expensive. The main front block is occupied by a dining-hall and classrooms, and the school forms a wing in the rear. In the plan, the position of kitchen with respect to the dining-hall and masters' rooms, have been considered; and there is much in this part of the plan which is like that of the design placed first. The corridor is rather long. "Compass and Square" in circle, is another clever well-drawn Gothic design, but costly; the dining-hall is made a prominent central feature, and there is a long centre corridor, but the school is long, and is cut off from classrooms by lavatories, and the main offices are straggling.

"I Strive to Win" (we believe by Mr. Webb, of Reading), is the motto of a creditable set of drawings. The author seems to have worked out the conditions of the plan with care; the school, class-rooms, and domestic offices are all in good positions, the isolated sick-ward is a desirable arrangement, and the least satisfactory parts are the want of continuity in the corridors, and their lighting, and the length of school-room. No less than five designs have been submitted for the elevations; these are treated in Gothic, Queen Anne, and Old English. The elevation in brown ink in a Late Gothic style, with dormers, and another, "L. S. D.," in a picturesque 17th-century style of Domestic character, display decided taste. We hear that this design was favourably considered by the Committee. "Experto Crede" is a Queen Anne design; the brickwork is relieved by bands, there are dormer gables along front; the arrangement lacks compactness in the domestic offices, though there are good points, as the lavatories, the division of the boarders, &c. The school forms a lengthened front. The alternative plan is the best. "Oxford and Cambridge" (Gothic), shown by a neat perspective, shaded in Indian ink, is remarkable for the small windows; in other respects, there are creditable points, though the plan is indifferent. "Manners Makyth the Man" is an able design in Queen Anne showing some picturesque handling but wanting in coherency. There is the London School Board ring about the front, a series of dormers cut it up, and the treatment of flat arches in the end gable windows looks weak and hard. The plan is too costly. Why two large schoolrooms 48ft. by 22ft. each? These form the facade, and the dining-hall is made to connect the house, which is behind, with the school. "School," in a 15th-century French Flamboyant style, is the motto of a clever set of elevations, lightly relieved by sepia-washes in roofs and windows. There is some spirited and piquant detail, but we are constrained to remark the unsuitableness and expense of the style for the purpose intended. The plan is not satisfactory. Near are hung two striking designs under the motto "Study," though apparently by different hands. One of them is in a Queen Anne style, with timber framing in parts, pleasing in detail but wanting in rhythm and character; the other is in a more monumental collegiate Gothic style, but the plans are less satisfactory. One of them has a long, ill-lighted corridor, and both fail to carry out the conditions of a school residence. "Design with Beauty, Plan with Care," is the motto of a competitor who evidently has worked out his design under a sense of the truth conveyed in the above maxim. The Gothic is of a more sensible and moderate kind than many others, and the chief faults are in plan the great length of school-room and the large area occupied by the buildings. Some good features are to be seen also in "Nota Bene," who sends a bold pencil perspective in Domestic Gothic; but the porch and oriel window of the house has an awkward squatness. The elevations are well drawn, but the plan scattered. "Druid," Gothic, a well-treated elevation, simple and broad in effect, makes the dining-hall a centre feature, and puts the offices in the rear. The school is made a projecting wing. "Multum in Parvo" is better in plan, with a bold tower entrance. "1881," in a mixed style, semi-Classic with some half-timbering in the gables, is a clever design, exhibiting artistic feeling and shown by a neat perspective of suitable character.

We must pass in rapid review a few other designs, many exhibiting great labour and skill in preparation. "To Be or Not To Be" is in a monumental Gothic style, with centre tower and a half-timbered house; the elevations are well drawn, but the plan incoherent. "'Twas in the Prime of Summer Time," &c., is picturesque in the parts; the end wings advance from the front, and bold Gothic and Jacobean features are blended, but the planning and lighting are imperfect. "One Lives and Learns," in a mixed, rather undistinguishable style, half Italian, half Queen Anne, has too straggling a plan, and the school and class-rooms are poorly arranged. "Propria Quæ Maribus," is too confused in plan though picturesque in elevation, French Gothic in character, and shown by a cleverly drawn perspective. "Licet Mihi Appelere" has some good points in plan, but we question the tradesmen's entrance being put where it is; the dining-room and servery are well planned, but the scheme lacks simplicity. Three alternative designs are shown, one in Queen Anne. No. 2 is a quadrangular arrangement but too irregular to make it desirable. "Plan" has a clever ink perspective in a Domestic Gothic. "Spes," "Enter these Portals," "Woodstock," "Dulce Domum" in circle, "A Outrance," "Progress," "Mens sana in Corpore sano," "England," "Pelican," "Experience," "Education," "Syntax," "Newbury," "Rien sans Dieu," "Agamemnon," "I.C," "Detur Digniori," "Architect," "Quilibet," "Spes," are a few others of which we cannot speak.

The requirements of warming and ventilation have, we find, not been lost sight of by some of the competitors, and, other things being equal, the trustees ought to take these

questions into consideration. It is important that the heat required in the school and class-rooms should be utilised in warming the dormitories over by flues in connection with the heating-chambers or stoves, and we find the author of one premiated design has provided for such utilisation, and that Boyd's stoves, in conjunction with the fire-places and coils in window-recesses, have been specified. Extracting flues and air-pump ventilators are shown in many of the designs, and in an establishment of this kind it would be possible to make the smoke-flues not only useful in warming, but in causing up-draught for the escape of foul air. Not less necessary is the demand for good drainage : the soil and waste-pipes should be placed outside, and not only be trapped but disconnected; and provision might be made for the storage of the rain-water as indicated in some of the plans. Cost has been exceeded by many of the competitors, and some ridiculously low figures per foot cube are made the bases of estimates. Mr. Waterhouse's decision, we may add, will be subject to the approval of the Charity Commissioners, and we may express the regret that a wider selection was not made.

THE LATE MR. B. J. TALBERT.

WE regret to announce the death of Mr. Bruce James Talbert, which event took place at his residence, 5, Euston-square, on Friday evening last. In him we have lost one of our best decorative designers, and many of our readers will feel that they have lost a kind and genial friend.

Mr. Talbert, whose decease has taken place at the early age of 43, has made a name, as a designer of furniture, which has not been equalled in England since the days of Chippendale and Adams. He commenced his working life with a wood-carver in Dundee, and afterwards acted as an assistant in the office of an architect in that town. Leaving Dundee, he went to the office of Mr. W. N. Tait, in Glasgow, and then to Mr. Campbell Douglas, in company with Mr. J. J. Stevenson and Mr. Sellars. Mr. Talbert was conspicuous in Glasgow for his talent as a draughtsman, and he here made the acquaintance (an acquaintance which ripened into a happy friendship when they met some years afterwards in London) of some other young architects and artists, who, like Mr. Talbert, have made a somewhat prominent figure in the art world.

Subsequently he worked largely in designing metal work for Messrs. Skidmore and Co., of Coventry, and while there was engaged to elaborate and work into detail the designs of the late Sir Gilbert Scott for the metal-work of the Albert Memorial. Mr. Talbert's first engagement in London was with the old firm of Messrs. Holland and Sons, of Mount-street, Grosvenor-square, who executed some of his earlier furniture designs. After this, he was employed chiefly by Messrs. Jackson and Graham, for whom he designed many of the principal decorative objects exhibited by that firm in the various international exhibitions both at home and abroad. Leaving this house, he entered practice in Gower-street on his own account, and settled down to the class of work by which he has made his name so well known, and his influence so widely felt. The Gothic school had no more enthusiastic and earnest worker than Mr. Talbert, and the publication in 1867 of his first great work, "Gothic Forms; applied to Furniture, and other Decorations for Domestic Purposes," brought him to the front rank as a designer of furniture, a position he continued to improve, and an influence which he extended to the end of his life.

Though devoted more especially to furniture, his ability as an architect was of a high order, as those who remember his design for the Manchester Town-hall—one of the three selected—will admit. In 1876 Mr. Talbert published a second volume of "Furniture and Decorative Designs," which publication, like his work already alluded to, met with considerable success both in England as well as America, where Mr. Talbert's designs found many admirers and copyists, especially his earlier productions, which were almost entirely Mediæval in character and ornate in detail. The designs which he recently prepared were more than often based upon Jacobean models, a style which he, perhaps, made more decidedly his own than any other, though much of his work depended upon simple natural forms. His life was a generous and unassuming one, and he was ever ready to assist others. By his death the Hogarth Club loses one of its most sociable and prominent members. He was at one time a constant contributor to the pages of the Building News, nearly all his Royal Academy drawings having been published in our pages. Mr. Talbert also designed the Building News heading, which, it will be remembered, was chosen in an open competition by Prof. Donaldson, who acted as referee.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE seventh ordinary meeting of the present session of the Institute was held on Monday evening, the President, Mr. J. Whichcord, F.S.A., in the chair. The Secretary announced the recent deaths of two honorary and corresponding members, Mariette Bey, of the Boulak Museum, at Cairo, and Professor Martin Gropias, of Berlin. The hon. secretary stated that six candidates had offered themselves for the Pugin Travelling Studentship, viz.: E. J. Milner Allen, of High-bank, Fulham, S.W.; F. W. Booker, Cromwell-terrace, Cromwell-street, Nottingham; A. Hemingway, 103, Heaver-street, Battersea, S.W.; Francis Hooper, Elmleigh, Hayne-road, Beckenham; W. R. Lethaby, 20, Calthorpe-street, W.C; and Jas. Andrew Minty, 16, Marshall-street, Edinburgh. After carefully considering all the drawings, the council had elected Mr. Lethaby to be the Pugin student for 1881. An exhibition of the drawings by all the candidates would be held during the week commencing Monday next, Feb. 7th. Mr. R. P. Spiers remarked that the successful candidate gained the Soane Medallion in 1879.

PERSIAN ARCHITECTURE AND CONSTRUCTION.

A paper, written by Professor T. Hayter Lewis, who is now in Egypt, from materials furnished by Mr. Caspar Purdon Clarke, now travelling through India, was read for the joint authors by the Secretary. It commenced with the following introductory passage :—The objects of art, with most of the drawings which illustrate this paper, were lent to me (Professor Lewis) by Mr. Caspar Purdon Clarke, who for some two years was employed by Her Majesty's Government as resident architect to the British Embassy in Persia, and who is now in India on a mission from the authorities of the South Kensington Museum. To him I also owe many valuable suggestions respecting theories of the formation and influence of Persian and other Eastern Art. I am afraid that to many of the members the subject will not have much interest, for it may seem to be but remotely connected with our present work. To me, however, the study has served as a relaxation from the hard work of ordinary professional life, as it appears to show the source of the new and grand outlines practised by the Byzantines—outlines which, in various styles, are now homely forms to us. The dome, for example, not springing timidly, as may be said even of the great Pantheon of the Romans, from a circular base, built solidly up from the ground, but raised high in the air, on four great arches, whose angles were gathered up into pendentives to form a base, high above, for the dome which was to cover all. To Persia, too, whether under its various conquerors or its native race, we owe, so far as I can gather, that singular form of pendentive, the honeycomb—one of the most distinctive features of Arab art—and many, if not most, of the beautiful ornaments of tile work, incised marbles, and other refined decorations, which give so great a charm to Byzantine and Arab work. Through Byzantium, Egypt, Spain and Venice, Persian art deeply influenced Mediæval work in Italy, Germany and France; and not until the rise of pure French and English Pointed architecture did this influence pass away. It affected us again in later times. When we look upon the dome of St. Paul's Cathedral, when we consider the decoration best fitted for it, and envy perhaps the skill of Sir Christopher Wren, it will be well to remember that, some 1300 years ago, the same form was built up in a bolder way, and its surface was decorated by the Byzantines in a manner which we are only now trying to imitate; and that these same Byzantines worked, so far as I can learn, after the hints supplied to them by the Persians. The paper treated of the unique character of Persian history, Persia being the only one existing of the ancient great monarchies. Nearly all the accurate knowledge possessed of it, derived from personal investigation, was due to Sir R. K. Porter, Texier, Flandin, and Coste, with such memoranda from residents in Persia (but without the assistance of drawings) as were given by Major Smith and others. The valuable essays which Mr. Fergusson had written, partly from those materials, were well known. According to him, no hiatus in architectural history was more complete than that of Central Asia during the ten centuries which elapsed from Alexander to Mahomet. A map, showing by various tints the boundaries of the Persian Kingdom at different times and under different dominations, was exhibited, and a reference was made to a letter, but little noticed, of the historian, Niebuhr, who, long before the discoveries of Botta and Layard, prophesied that the time would come when those who lived after him would find on the Tigris and the Euphrates the origin of Grecian art and mythology. The drawings of Persepolis, forming part of the University College series, were exhibited and referred to; also a drawing, from the same series, of the Tomb of Cyrus, which bore evidence of Grecian art—a fact to be explained by the constant communication of the Greeks through the Ionian Colonies with Persia. That much Greek influence was at work there before the conquests of Alexander was probable, and his conquests were not mere invasions. Alexander built cities in conquered countries, and peopled them mostly with Greeks. Two such cities were built on the farthest limits of his dominion, some 150 miles north of Moultan, near the scene, in our own times, of the Battle of Chillianwallah; also one near Cabul, another near Candahar, two others on the Indus, and one near the modern Merv. The details of Indian work from the time of Asoka, some 70 years after Alexander's death to the later times of the Amravati Tope, about the fourth century of our era, showed Greek influence. Analogies between the details of carvings at Persepolis and at the Sanchi Tope were referred to. Illustrations of the same were exhibited. The paper continued with references to the dominion of the Greeks in Asia; the revolt of Bactria and Parthia; the new Bactrian monarchs, who were also Greeks, and who ruled until B.C. 120, in Cabul and Western India; the Indo-Scythian kingdom; colony founded by Trajan at Nineveh; the ruins at El Jerash (the ancient Gerasa) in the almost uninhabited land of Moab; Sassanian rule in Persia, Syria, and Egypt; the reproduction of ancient Persian forms at Ferozabad and Serbistan, &c.; the Persian plan still worked on in the Saracenic works of Syria, Egypt, and Sicily, as well as in the great commercial route from Alexandria northward to the South of France. Whether the Byzantine pendentives came from Persia it was impossible to say, but the mode of lighting domes, as at St. Sophia, was undoubtedly due to the Persians. References were made to the over-running of the Persian native empire (the Sassanians) by the Arabs, whose capital was established at Baghdad; to Mahmoud of Ghazni; to the invasions of the Mongols or Moghuls; to Timour or Tamelane; to Moghul architecture in Persia and North-Western India. The paper then touched upon the actual mode of planning and building houses in Persia, a mode which had been in use for centuries; and with regard to which Professor Lewis said :—The drawings which Mr.

Clarke has supplied, and which I take as my text, are the ground-plan and sections of a Persian house built about 1650. It has the open court, which answers in some measure to the Roman atrium, though the disposition of the whole plan is unlike the Roman. Roughly speaking, it consists of a long open court with rooms on the two longer sides. The entrance is at the end of the rooms next the road, through a small but very pretty octagonal hall, somewhat unusual in plan and with a peculiarly groined roof, the design being described to me as like that of Beejapore, which was illustrated in the Institute *Transactions* by Mr. Fergusson. Out of this hall you turn sharply to the left into a passage which leads sideways into the court. By this sudden turn, the privacy of the house is quite protected, an object which I am sure ought to be borne in mind more than it is in our own plans. In the centre of the court, which is paved with square tiles, is a square sinking for water and its fountain. On the side opposite to the entrance are two rooms and a kitchen. There is an upper story over some of the rooms, but in general they are ceiled only by the roof. In planning such a house, the Persian architects use paper which is ruled crossways in faint lines—paper similar to that used in France and Germany by architects, and in this country by engineers—the divisions representing the ordinary thickness of the walls. To speak broadly, the architect has only to draw his brush through these squares, and the workman knows just what is wanted. I need scarcely say that this method of working gives a sort of rhythmical proportion to the different rooms, and it materially assists in continuing the rectangular system of planning which has so especially characterised Eastern art from Egypt and Assyria downwards. At the same time, the exquisitely beautiful manner in which, in the East, the square form is often gradually brought into the octagonal or round, by almost imperceptible degrees, takes off the unpicturesque appearance which these plans would otherwise have. To get to the upper-story, the stairs are formed in a way which seems to be likely to lead to accidents. The steps are all planned as winders, not ascended as ours would be—round a cylinder—but winding very little, each step being made just large enough to take one foot, so that the stairs can only be ascended and descended one way, and that way not a very safe one to an unpractised climber. A sketch, by Mr. Clarke, of part of the stairs of the house, the plan of which I give, illustrates this peculiar mode. I now come to the ornamental work. The surfaces, much raised, are executed in plaster, possibly stamped but never cast. The plaster when being mixed with water is beaten up, so as to prevent its crystallising, and is at the same time mixed with a decoction of madder-root or with sugar. The plaster thus treated will not harden for several days, and in order to make this paper as practical as possible, I have had this method tried by an experienced plasterer. The result may be seen in some twisted specimens which I exhibit, and which did not set for several days, though without the treatment I have described they would have been quite hard in a few minutes. By retaining the plaster in this moist state, the plasterers are able to work all the ornaments by hand with great facility on the spot; and much in fact as the Italian band of plasterers who came over here at the building of Queen Anne's churches, when such beautiful work as that at St. Martin's-in-the-Fields was executed by them by hand. In a Persian living-room the chief object of decoration is the fireplace, the opening of which rises higher than in our own fireplaces. The fuel used is wood, composed of long logs set up on end on the hearth. A flue leads like ours to a chimney top, often prettily ornamented. Next in point of decoration are the windows, formed in plaster-work of beautiful patterns, the chief being that of a slender central stalk branching out into delicate conventional forms. The effect is, of course, that of a screen keeping out the fierce rays of the sun, and when filled with coloured glass, like the specimens exhibited, producing a most beautiful effect. The doors are equally ornamental, and are made of small pieces of wood. Professor Lewis concluded with a reference to some of the forms of Persian decorative work, expressing Mr. Clarke's opinion that they were derived from the Tartar or Chinese—perhaps from Tartar-Chinese art—notably the bulbous dome. The Professor, having referred to objects of Persian work at South Kensington, exhibited some specimens of ornament, and some drawings lent to him by Mr. Clarke; and he closed his paper with the following paragraph:—I may say that Persia, invaded, conquered, desolated, in the hands of strange masters for centuries at a time, still shows, in the words of Major Smith, that "Persian art, from the earliest times until the present day, has retained a distinctive characteristic style," and I will venture to say that in it are to be found outlines, colouring, and decorative work which have formed the bases of many of the most beautiful architectural forms handed down to us by the Byzantines and the Arabs.

Mr. James Fergusson, F.R.S., said the paper they had just heard was of a very interesting character, and one of a class too seldom heard in that room. It was to be regretted that Prof. Lewis had dealt with so wide—too wide—an interval of time and ground, that adequate criticism was impossible in one evening. The peculiarity of Persia was, that it was never one country—never inhabited by a single homogeneous race of people. Indeed, it was the site of the dwellings of the three races of men whom the Bible described as the descendants of Shem, Ham, and Japhet. The perplexity introduced by the interminglings and overlappings of peoples was so great that no one could distinctly follow the shufflings of the cards. The architecture was similarly complicated, so that no reliance could be placed on any theoretical sequence of styles. The Greeks left some traces of their presence; the Parthians also, to a smaller extent; the Sassanians more; but perhaps the Persian modes of building grew with a large addition of Arab element, and an admixture of the Mogul influence. These combinations of foreign influences, as puzzling as they are unsatisfactory, were illustrated in the plans and elevations which were exhibited on the walls. He differed from Mr. Purdon Clarke in his condemnation of the influence of the Moguls. All the most beautiful buildings, not only of Samarcand and other Persian towns, but of many parts of India, were the work of Timour the Tartar, and to the Moguls the decorative use of colours was due. The Palace of Mashita was a remarkable structure, well worthy of careful study. It was built about 610, and apparently by Byzantine architects, for it stood on a distinctly Corinthian base, and was everywhere ornamented with the acanthus-leaf. It had been thought that the Saracens based the style they used in Spain on a certain amount of Christian art, mingled with Turanian ideas. In this palace was to be seen a good example of the pendentive dome—later, of course, than that of St. Sophia. Prof. Lewis had spoken as if the pendentive dome was invented in Persia. He could not positively say it was not; but his own opinion was that the whole series of domes was to be traced in Christian lands between the simple idea of a domical cover, as worked in the Pantheon at Rome, and the use of pendentives at St. Sophia, Constantinople. He did not think that the Western architects obtained any help in their conceptions from the East; the invention of the dome was, he believed, a Byzantine, and not a Persian, idea. The author had spoken of the Oriental domes as exceedingly intricate in plan; but when he was at the Crystal Palace with the late Joseph Bonomi during the building of the Alhambra court, he noticed that the workmen used a number of triangular, round, and other simple forms of pieces of plaster, and fastened them together by little notches as easily as one would build a brick wall. The result was pretty, ingenious; but not grand or dignified.

Mr. Crace called attention to some drawings and a plan of a 17th-century house at Bagdad, which he described as a very pretty example of Saracenic architecture, having some Persian peculiarities. He stated that the Palestine Exploration Committee were about to undertake explorations on the east of the Jordan, a district which had been little disturbed since it was laid in ruins, and which was expected to yield much interesting information which would bear on Persian architecture of the Roman period. Prof. Lewis had stated that the Persian tiles ceased to be made in the 17th century, but he believed, from the inquiries he made at Damascus, that the art had not died out at the close of last century. It was hopeless to attempt to trace a direct sequence between the art of ancient Persia and the almost purely Saracenic art which exists in Persia at the present day.

Mr. William Simpson referred to the somewhat analogous architecture he had examined in the Jellalabad Valley and in Delhi, describing in detail the mosque of Kila Kona, and the old fort in the latter city, which he considered the finest domed building in India, or indeed in the East. The pierced windows, of which an example hung on the wall, were common in the East, and were used for ventilation and to keep out animals; in India they were carved in marble; in Kashmere and at Cairo they were of wood, but he had never before heard of plaster ones.

Mr. R. Phene Spiers observed that considerable stress was laid in the paper on the originality of the Persians, not only in decoration but also in construction, although he had not heard sufficient proof advanced as to the latter point. They had been told that the great pendentive dome was derived from Persia, but he had heard no reason to doubt Mr. Fergusson's theory that the dome was developed by Byzantine builders, and nothing more than a pendentive-roof had been illustrated from Persian sources. It seemed that the stalactite or honeycomb vaulting, of the intricacy of which so much had been said, was built up of a number of simple forms, and it was evident that the later examples were much more complicated than the early ones. The pierced windows of the East, it should be remembered, were placed so high up in a lantern that only the reflection of the light transmitted by the stained-glass was cast upon the whitened walls, and in that climate this afforded sufficient light in the rooms.

Mr. G. Aitchison, B.A., referred to the very large and valuable collection of Persian masons' trade-books and plans, illustrating the architecture and decorations of that country, which Mr. C. P. Clarke had secured for the South Kensington Museum during his mission in that land, of which only a small portion were exhibited that evening, and stated that so thoroughly were the principles of the art understood that Mr. Clarke took a plan and section of an elaborate cornice in one town, and gave the drawings to a workman at Teheran, who from them made an exact reproduction on the British Embassy premises in the latter city. The pendentive domes were built up of inlays of wood, cut to the required shapes on the ground, set up, and covered with plaster. The house at the Paris Exhibition of 1878, erected by the Shah of Persia, was executed in this manner. The pierced windows, referred to by Mr. Spiers, were not always set so high in the walls as he had said; they were seen directly in the lower rooms when the glass with which they were filled glittered like jewels.

The President, in closing the discussion, expressed his gratification at the announcement made by Mr. Crace as to the proposed explorations in Eastern Palestine, and proposed a vote of thanks to the author of the paper that had been read. At the next meeting of the Institute, to be held on Feb. 14, the discussion on "Sanitary science" would be resumed.

THE NATIONAL BUILDERS' ASSOCIATION.

The National Association of Master Builders of Great Britain held their sixth half-yearly meeting at the Palatine Hotel, Manchester, on the 26th ult, when the following towns were represented—namely, London, Liverpool, Manchester, Salford, Lancaster, Wolverhampton, Bradford, Northampton, Lincoln, Leeds, Warrington, Wigan, Birmingham, Sheffield, Huddersfield, Portsmouth, Doncaster, Edinburgh, Dundee, Rochdale, Crewe, Macclesfield, Bolton, Kidderminster, Stalybridge, St. Helens, Hull, Oldham, and Meltham. The report of the Council and the accounts for the last half-year were adopted and directed to be circulated. The National Association of Master Painters of Scotland, which has affiliated itself to the National Association of Master Builder of Great Britain, was represented at the meeting. The following gentlemen were elected as officers for the ensuing year—namely, Mr. Stanley G. Bird (London), president; Mr. W. H. Cowlin (Bristol), and Mr. Robert Neill, jun. (Manchester), vice-presidents; and Mr. Edward Hughes (Liverpool), treasurer. Mr. Thomas Clay (Manchester), the late president, who was

compelled to retire through ill-health, was elected an honorary vice-president, and great regret was expressed at his enforced retirement. It was decided to increase the number of gentlemen forming the Council from 21 to 25, and representatives from Edinburgh, Bolton, Hull, Sheffield, and Portsmouth were elected members. It was also decided, on the invitation of Mr. Stanley G. Bird, to hold the next half-yearly meeting in London. The question of extending the Association was considered, and this was recommended to the consideration of local associations, who were requested to take the matter up in their respective neighbourhoods, with the view of increasing the number of local associations. The question of the liability of employers under the Employers' Liability for Injuries Act was considered, and after some discussion, during which several schemes of insurance were submitted by the Sub-committee appointed for that purpose, it was decided to refer the question to them for further consideration, and to bring the matter to maturity at the earliest possible date. After the meeting the members of the Council and other gentlemen from local associations in the immediate neighbourhood were entertained at a banquet by the members of the Manchester and Salford Builders' Association.

PLYMOUTH DOCKYARD EXTENSION WORKS.

AT the meeting of the Institution of Civil Engineers, on Tuesday, Mr. Abernethy, F.R.S.E., President, in the chair, the paper read was on the "Portsmouth Dockyard Extension Works," by Mr. Charles Colson, Assoc. M.Inst.C.E.

These works were on the north side of the island of Portsea, somewhat to the east of the old dockyard. The area inclosed was about 180 acres, of which 95 acres had been reclaimed from the mud lands of the harbour. The works were designed by Colonel Sir. A. Clarke, K.C.M.G., C.B., R.E., Assoc.Inst.C.E., and were carried out under the superintendence of Mr. H. Wood, M.Inst.C.E., Mr. J. Macdonnell, and the author.

Before the works could be commenced it was necessary to inclose the site. This was done by constructing a shallow dam on the highest part of the mud, and an outer dam inclosing the harbour wall. The inner dam was completed in October, 1868, and 1,200ft. of the outer dam were closed at the same time. The additional water area or basin accommodation consisted of the tidal basin, 9 acres in area, with a depth of 43ft. 6in. at H.W.O.S.T., and 30ft. at L.W.O.S.T., and about 1,600ft. of wharfage; the repairing basin, having an area of 21 acres, and 34ft. 10in. in depth at H.W.O.S.T., and 21ft. 4in. at L.W.O.S.T.; the rigging and fitting basins, each having an area of 1½ acres, with 34ft. 10in. depth of water at H.W.O.S.T., and 21ft. 4in. at L.W.O.S.T.; the wharfage accommodation in the three latter basins was equal to about 8,200ft. The whole of the works were constructed in Portland cement, more than 100,000 tons having been used.

The retaining walls for the basin and harbour wharves varied in sectional area according to the position and depth from the level of the coping. The tidal basin wall was 48ft. 10in. in height, and the width at the base was 22ft. 6in., diminishing to 6ft. at the top. The harbour wall was 44ft. 6in. high by 20ft. wide at the base, and the basin walls were 38ft. 6in. high and 16ft. wide at the base. The materials used were brick and concrete, with Portland stone for facing at the top, and granite coping. The foundations were laid upon piles ordinarily spaced 5ft. and 4ft. apart from centre to centre The size of the piles varied from 11in. to 15in. in diameter, and their length from 14ft. to 19ft. for beech and 20ft. to 30ft. for fir; transverse and longitudinal sleepers were fitted over the pile heads; on the outside was a continuous row of sheet piling. The pile shoes were of a composite character, the plug being of cast-iron, with wrought-iron straps; all the piles, with the exception of the back row, were driven to the same batter as the wall, viz., 1 in 8. The toes of the walls were protected by a concrete foreshore about 10ft. wide.

The docks contemplated were five in number; of these only three had been constructed, viz., two communicating with the repairing basin, and the deep dock, which was entered from the tidal basin. The entrances only of the two others had been constructed, the docks being left for future consideration. The foundation of one of the docks on the south side of the repairing basin was partly on the London clay and partly on the sandy beds below, and was constructed of beech piles from 14ft. to 16ft. in length, spaced generally 5ft. by 4ft. apart, except near the head, where the lines of piles were altered to suit the curve. Considerable difficulty was at times experienced in driving these piles, in consequence of meeting with isolated beds of stone. When these stones were near the excavation level they were removed, and the pile was driven in its proper position, and the hole filled with cement. The foundations for the broad altar, and all works above, were also on piles, but at a higher level than the foundation for the floors and lower altars. The spaces between the sleepers on the top of the piles, and to a depth of 2ft. 6in. from the top, were filled with Portland cement concrete. The floor was constructed of Portland stone and granite, and was 7ft. 6in. thick. The length from within the entrance to the broad altar at the head was 410ft.; the width between the copings was 110ft., and mean depth 42ft. The entrance to this dock was constructed for an ordinary ship caisson; the width between the copings was 80ft., and the depth of water at H.W.O.S.T., 38ft. 6in. The other dock was parallel with the one just described; the width of the wharf between the two being 100ft. The foundation of this dock was somewhat different, as the piling at a higher level for the broad altar was omitted, and the excavation was continued to the same level as the foundation of the floor of the dock. The length of the floor from the inside of the entrance to the broad altar at the head was 406ft. 6in., and the mean depth 42ft. 3in. The entrance was constructed for a ship caisson, and was 82ft. wide at the level of the coping; the depth of water at H.W.O.S.T. was 33ft. 10in. The culverts for filling and emptying both these docks were arranged on each side of the entrance. The two docks yet to be constructed would also be on the south side of the repairing basin. The piling in the foundations of the entrances had been omitted, the sheet piles only being retained. The deep dock on the east side of the tidal basin was so designed that ships could enter at low water of spring tides. In the foundations, the ground having proved more satisfactory than had been anticipated, the piles were omitted, and an extra depth of concrete substituted. The total length of the floor of this dock, from the inner face of the entrance to the back of the recess at the head, was 415ft., and the mean depth 46ft. 8in. The culvert for emptying this dock was 7ft. in diameter. The entrance was 82ft. wide at the level of the coping, and the depth of water at high and low water of spring tides 41ft. 6in. and 28ft. respectively.

The north and south locks were abreast, to the north of the deep dock, and formed with the tidal basin the grand entrance to the system of docks and basins constituting the extension of the dockyard. The length of the floor inside the entrances was 438ft. and the width at the level of the coping 100ft. The west entrance of the deep dock and lock was closed by a sliding caisson, which could be hauled into a chamber by engines and gear placed in chambers beneath the roadways. The depth of water over the sills of these entrances was such that ships could enter at low water. The east entrance was closed by a ship caisson, and had the same depth of water as the other docks.

All the docks and basins were drained by a 7ft. culvert, communicating with the two main pump wells. These were situated at the south-west corner of the repairing basin, and were 55ft. 6in. deep below the level of the coping. All the sluices were of cast iron, faced with gun-metal, and the arrangement of the machinery was such that the valves could be raised either by hand or by shafts and gearing in connection with the capstan or caisson engines. Each penstock was provided with an arrangement for throwing the clutch out of gear by the action of the valve, when it was either completely raised or lowered. The whole of the penstocks, capstans, and sliding caissons were worked by compressed air. The main pumps were on the plunger principle, with plungers 6ft. in diameter and of 6ft. stroke, constructed by Messrs. James Watt and Company, of Birmingham. In the smaller drainage-chamber of the well there were three single-acting pumps, each 16in. in diameter, and having a stroke of 2ft. 6in. The engines for working these small drainage-pumps were of the ordinary type, having two inverted vertical cylinders, 16in. in diameter, and 2ft. length of stroke. The main pumping-engines were of the compound type, with two inverted cylinders, the high pressure being 40in. and the low pressure 64in. in diameter. These pumps were capable of clearing two of the largest docks, containing together about 90,000 tons of water, in about four hours.

THE STANDARD INSURANCE COMPANY'S NEW PREMISES.

SOME time ago we alluded to the new offices of the Standard Insurance Company, King William-street, E.C., as a building possessing the merit of departing from the commonplace type of Classic buildings, and we drew attention to the bold treatment of the basement and mezzanine, forming as they do a lofty substructure adorned with red Aberdeen granite pilasters, and to the Greek feeling of the ornamentation generally. Last Saturday afternoon the members of the Architectural Association paid their first visit to this building, and were conducted over the several offices and departments; the plans and working details being fully explained to them. The architects, Messrs. Boulnois and Warner, had a narrow and awkwardly shaped site to adapt running at the north end to an acute angle, which has been utilised by one of the two main stone staircases. On the ground-floor, at the south corner, is a public office, of ungainly form (an irregular pentagon), partaking of the shape of the ground, and measuring about 44ft. by 36ft. in its longest dimensions. It is paved with Minton's tiles, laid to a pleasing Greek pattern. Adjoining is another large office. The public office is fitted up as a bank, with manager's room, desks, counters, &c., &c. We notice that the dado, doors, architraves, and partitions are executed in mahogany. One column, encased in Scagliola, by Messrs. Bellman and Ivey, supports a long girder or beam in the plaster ceiling; but beyond this, there is little that is decorative to call for remark. Ascending the stone stairs, we arrive on the first floor. Here there is a board-room above the public office, lighted by three large windows with mahogany sashes and architraves, the lower sashes are lofty, and divided by vertical bars to represent French casements; there is a mahogany dado, panelled; a parquet border to the floor, and the doors and cornices are executed in mahogany. Lavatories and conveniences are obtained in the rear. The other rooms on this floor comprise a secretary's office, medical officer's room, and a large office on the north side, to be let. The second, third, and fourth floors are also arranged for offices and chambers in connection with the insurance business, or will be let. The basement is very commodious; the old vaults have been faced with white enamelled bricks, and have been converted into a series of well lighted and ventilated urinals and w.c.'s, light being obtained by Hamilton's prismatic pavement lights. There is also a high-pressure hot-water apparatus, an hydraulic lift, and commodious strong-rooms and safes, the latter fitted up by Messrs. Chubb and Sons. The heating apparatus and electric bells have been supplied by Messrs. Land and Co., of Stratford-by-Bow; the tilework dado to the staircases, by Mr. White, of Gresham-chambers; and the tile floor of public office by Messrs. Minton and Co. We may add that the works have been carried out in a thoroughly excellent manner by the contractors, Messrs. Perry and Co., and reflect credit on the various tradesmen employed. The stone-carving to the façade has been executed by Mr. Kelsey in a praiseworthy manner, and with a true feeling for Greek. The polished red granite pilasters of the basement have cast-iron stanchions behind them which carry the Corinthian columns and superstructure of the main façade, and the floors are all of rolled joists and concrete. The whole of the work has been under the superintendence of Mr. W. Stanley, clerk of works. The architects have kindly promised their drawings of the building, which we hope to illustrate at an early date.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—On Saturday afternoon last (Jan. 29) a visit was made to the new Science College in Edmund-street. There was a large attendance of members, including Messrs. T. H. Mansell, R. B. Morgan, T. F. Proud, A. Clere, J. P. Osborne, Fred. G. Hughes (hon. sec.), Messrs. E. Wood, and W. H. Kendrick, of West Bromwich; Messrs. H. H. McConnal, F. E. F. Bailey, and J. Ellis, of Walsall, &c. Mr. J. A. Cossins, the architect of the building, met and conducted the party.

LEEDS ARCHITECTURAL ASSOCIATION.—A meeting of this association was held on Thursday week, Mr. S. E. Smith in the chair. A memorial to the Royal Institute of British Architects was adopted, requesting them to require all Fellows to be elected from the ranks of the Associates, who in the future will be required to pass an examination. A paper entitled "An Apology for Perishable Construction," was read by Mr. D. Brade, of Kendal.

LEICESTER SOCIETY OF ARCHITECTS. — On Thursday evening, the 27th Jan. last, this society held a *conversazione* in the Museum Lecture Hall and School of Art, which was attended by nearly five hundred guests, among whom were the Mayor of Leicester, Alderman Kempson, Alderman Stevenson, Alderman Barfoot, Mr. Millican, and other members of the Town Council; Mr. W. S. Hobson, Mr. George Hodges, Mr. Frank Hodges, Mr. J. D. Linton, Mr. Orrock, Mr. G. T. Robinson, Mr. H. W. Lonsdale, Mr. R. Phené Spiers, Mr. Ordish, Mr. Shenton, Mr. Burgess, and others. These guests were received by Mr. Joseph Goddard, the President, in the great hall, where a very large collection of works of art had been collected. These were lent by collectors and connoisseurs in the town, and by some of the principal manufacturers in London. Among the drawings were several fine examples by David Cox, De Wint, Cattermole, J. D. Linton, J. Orrock, J. Fulleylove, Harry Ward, R. Phené Spiers, and T. Langham; a large study in pencil, by John Ruskin, of the West Doorway of Rouen cathedral, and several sepia drawings of Old Leicester, by the late Mr. Flower. Messrs. Trollope and Sons sent some fine pieces of old tapestry and modern furniture and faience, collected by Mr. G. T. Robinson from various manufactories throughout Europe. The Ladies' Work Society, 31, Sloane-street, sent specimens of embroidery and art needlework, among which were three or four pieces designed and worked by H.R.H. Princess Louise, president of the society, and a series of decorative china plaques were contributed by Miss Spiers. In the rooms of the School of Art Messrs. Collinson and Lock, Messrs. Richardson and Ellson, and Messrs. Gillow, of London; Messrs. Noble, Cort and Paull, and Elgood Brothers, of Leicester; and Messrs. Smith and Sons, of Birmingham, were all represented. Messrs. Heaton, Butler, and Bayne contributed cartoons for stained-glass drawn by Mr. Holliday and Mr. Shields, and Mr. H. W. Lonsdale sent the cartoons for glass of St. James', Croydon. In the museum buildings were Japanese drawings and embroidery lent by Mr. Cutler, and Persian carpets and embroidery by Dr. Dresser. So important a collection of works of art and art manufacture has rarely before been brought together for such a purpose, and it reflects the greatest credit on the energy and industry of the president and committee. In the conservatory, where a band of music played during the evening, were several designs by the architects of Leicester. On the following day Mr. Goddard entertained the principal guests and architects of the town at a luncheon in the Assembly Rooms, and it was arranged that a portion of the collection, viz., the water-colour drawings in the great hall, should be opened to the public till the following Tuesday.

SCHOOLS OF ART.

EDINBURGH.—The prizes gained in the year 1879-80 by students of the School of Art were distributed last week. The number of students under instruction in the School of Art during the year 1879-80 was 841. The awards obtained from the Science and Art Department, in the national competition, are:—Male School.—1 gold medal, being the third year in succession that this prize has been gained by the school; 3 silver medals, 5 bronze medals, 12 Queen's prizes (books.) Female School.—3 bronze medals and 2 Queen's prizes (books.)

HALIFAX.—The annual distribution of prizes in connection with the Halifax School of Art took place on Wednesday week. Mr. W. H. Stopford, the head-master, was unable to be present to read his report, for the first time since his appointment, having broken his leg by a fall in the street; but he wrote that the ladies' and evening classes had been unusually well attended, and 300 more works had been sent to South Kensington for examination than in any previous year. For a carpet design, J. W. Riley had taken a National bronze medal, the Owen Jones' bronze medal, and a book prize; and seven other Queen's prizes were gained. The second-grade examination, held in April, was the most successful ever held, and resulted in 54 passes, including 15 marked excellent. The report of the sketching class spoke also of an increase in numbers and an improvement in character of work.

WOLVERHAMPTON.—The annual meeting and distribution of prizes in connection with this school took place on Thursday, the 20th ult. The report showed that during the year 163 students attended the classes, an increase of fourteen on the previous year. Sixty-three students were examined in May, and obtained one prize and 15 certificates in art, and three Queen's prizes and twenty certificates in science subjects. At the National Competition seven third-grade and one book-prize were gained. Towards removing the building-debt of £1,600 (which has been a burden for twenty-five years), donations equal to one-half had been promised. Mr. J. H. Chamberlain, of Birmingham, then delivered an address on "Some of the Uses of a Knowledge of Art."

PARLIAMENTARY NOTES.

SUNDAY OPENING OF SOUTH KENSINGTON MUSEUM.—Last week Mr. A. Grey asked the Vice-President of the Council if the privilege of members of Parliament to enter the South Kensington Museum on Sunday afternoons could be restored. —Mr. Mundella could not find any minute relating to the existence of such a privilege. He thought the House would agree with him that if the South Kensington Museum was to be opened on Sunday at all it should be opened to the general public, and if it were to be closed it should be closed altogether.

THE TEMPLE BAR MEMORIAL.—Mr. Labouchere asked the First Commissioners of Works last week, whether it was his intention to take steps to remove an obstruction consisting of a griffin elevated above two statues representing her Majesty and the Prince of Wales, which had been erected opposite to the New Law Courts in the centre of a public highway.—Mr. S. Lefevre: Sir, the Corporation of London claim, and I believe have always exercised, an exclusive right and jurisdiction over the streets within the City, and the erection of any monuments there, and I have no intention of contesting their claim. I am further precluded from raising any question as to the obstruction caused by the Temple Bar Memorial by the fact that my predecessor most reluctantly gave facilities for a widening of the road rendered necessary by its erection. In order to prevent a much greater inconvenience to the public by the narrowing of the roadway, Mr. Adam felt himself compelled to resell to the City a strip of land, so as to add to the road to the extent to which it was to be diminished by the Memorial. The necessary effect of this was to reduce the footway in front of a portion of the new Courts of Justice by about five feet. The design for the Memorial was not submitted for the approval of Mr. Adam, nor was he in any way responsible for it. I think every one must admit, now that Memorial is completed, that a great mistake has been made; that it is very unfortunately placed; that the reduction of the footway in front of the Courts of Justice will be most inconvenient to the public; and that the Memorial itself is artistically unworthy of the site. I cannot but express my hope that the Corporation of London, which has always shown so much interest in questions of taste and public convenience, will defer to the general opinion of the public on the subject. I believe the best course would be to remove the main portion of the Memorial, which has some merits, to a point not far distant, where the road is much wider, and on re-erecting it there not to replace the griffin. I have communicated in this sense unofficially with the authorities of the City. I am unable, however, to say at present whether they will take any action. The matter rests entirely in their hands. I can only say that I shall be glad to co-operate, on behalf of the Office of Works, in removing any difficulties which may exist to such a course.

DECORATION OF THE HOUSE OF COMMONS.—Mr. Schreiber on Monday asked the First Commissioner of Works whether he intended to proceed with the mural decoration of the Central Hall of the House of Commons.—Mr. Shaw Lefevre: The question as to the best mode of filling the vacant panels in the Central Hall has been the subject of difficulty and doubt since 1871, when a committee of artists advised against proceeding further with mosaic pictures. I have not yet had time to solve the difficulty myself, and I cannot hold out hopes that an estimate will be proposed this Session.

THE NATIONAL PORTRAIT GALLERY.—In reply to Mr. Beresford Hope, who asked a question in reference to a supposed outbreak of fire at the above named gallery,—Mr. Shaw Lefevre said on Monday: I am glad to be able to assure my right hon. friend that the occurrence to which he refers at the National Portrait Gallery did not assume the proportion of a fire. What occurred was due to an over-heated flue, which, through 9in. of solid brickwork, caused to smoulder a little hay with which some rats who had bored a hole through some concrete had made themselves a nest adjoining the brickwork of the flue. The smoke of the hay gave warning, and in a few minutes the danger was removed. There is no damage to the building or its contents.

THE METROPOLITAN WATER BILL.—In the House of Lords on Tuesday, Lord Camperdown asked whether, considering the present state of public business, it was not advisable to introduce in that House the Bill providing for the creation of a Metropolitan Water Trust. Lord Dalhousie replied that the measure was at present under the consideration of the Home Secretary, who had not yet arrived at any decision on the subject.

CHIPS.

The parish-church of Burstock, Dorset, has been restored, at a cost of £440, from the plans and under the superintendence of Mr. P. H. Peters, of Victoria-street, Westminster, and Sevenoaks, Kent.

The Beckenham local board accepted, at their last meeting, the resignation by Mr. Watkins of the office of surveyor to the board. At the same meeting it was decided to obtain tenders for the Shortlands section of the sewerage scheme, and it was reported that 8,248 yards, out of a total length of 24,655 yards of main sewering, had already been completed.

A new organ is being erected in the parish-church of Filey. Messrs. Forster and Andrews, of Hull, have taken the contract at £412.

St. Marychurch New Club and Coffee Tavern was opened on Saturday last. The style of the new building is Domestic Gothic, built entirely of red brick with dressings of Watcombe terra-cotta. The work has been carried out by Mr. A. Harris, builder, of St. Marychurch, from the designs and under the superintendence of Mr. E. Appleton, architect, Torquay. The cost of the building is £800, and of the furniture £300.

At a meeting of the Scottish Society of Water-Colour Painters, held in Glasgow on Tuesday, for the election of members and associates, Messrs. Pollock, S. Nisbet, and G. Straton Ferrier, artists, Edinburgh, were advanced from the ranks of associates to members, and Mr. Robert Little, also of Edinburgh, was elected an associate.

A winter meeting of the Bristol and Gloucestershire Archæological Society was held at the Ladies' College, Cheltenham, on Wednesday week, when two papers were read, one by Mr. G. B. Witts, descriptive of his exploration of the long barrow, recently discovered at West Tump, Buckholt Wood, which contained a walled passage 2ft. wide, of oolitic stones, leading to a chamber, these containing human skeletons and bones of deer and oxen, and flint arrow-heads. The other paper, by Mr. J. H. Cooke, of Berkeley, dealt with the sixteenth-century manuscript histories preserved in Berkeley Castle, and their author, John Smyth, of Dursley. A loan museum of antiquities was brought together at Cheltenham for the meeting.

A stained-glass window has been placed in Marlborough College Chapel to the memory of Mrs. Thomas, the wife of the bursar. The chief subjects are figures of St. Cecilia and Miriam, and beneath are groups representing the family at Bethany, and Ruth refusing to leave Naomi. Messrs. Clayton and Bell, of London.

At the half-yearly general meeting of the Great Eastern Railway, held on Friday, the Chairman stated, in reply to questions, that the directors had instructed Sir John Hawkshaw, C.E., to report as to the best site in Norwich for a new passenger station.

LYVEDEN NEW BUILDINGS.—FIRST PREMIATED DESIGN FOR THE LIVERPOOL SCHOOL OF ART.—DECORATION FOR A MORNING-ROOM.

OUR LITHOGRAPHIC ILLUSTRATIONS.

LYVEDEN NEW BUILDING.

LYVEDEN NEW BUILDING, so called to distinguish it from the neighbouring and less interesting Old Building, lies far away from everywhere in a Northamptonshire field. It is a ruin, the ruin of a house that was never finished, whose accomplished architect and owner, Sir Thomas Tresham, died in the midst of his labours, leaving not only Lyveden, but Rothwell Market House, and the Triangular Lodge at Rushton, as lasting monuments of his singular skill and untimely death. Lyveden Old Building was one of the seats of the Tresham family, Rushton was another, and both these belonged to the branch of which Sir Thomas was the representative at the end of the 16th century. He was a Roman Catholic, and suffered much for the sake of his conscience during the reign of Elizabeth. He was saturated with the spirit of his religion. No man who ever lived was more deeply versed in the mysteries of the Trinity, and no man ever gave quainter expression to his knowledge than the architect of the Triangular Lodge at Rushton. Of all his known works, this lodge is the only one that reached completion, for his death, which occurred in September, 1605, was speedily followed by the arrest of his son Francis for complicity in Gunpowder Plot, and Francis being gone, there was no one to carry out the uncompleted buildings, even if they could have been finished by any other hand than Sir Thomas's. But, unfortunate as was his death, it fixes to a year the date of Lyveden, for there are innumerable evidences of the sudden collapse of the works in consequence. The window-mouldings are unmitred, the shields are not all completed, while hardly any of the mouldings, chamfer stops, key-stones, and so forth, of the internal doors, are quite finished. This building is a singular example of the Elizabethan style, displaying an intensely Gothic spirit, clothing itself in Classic garments, and with an admirable judgment. For, whatever may be said against the employment of a complete entablature half-way up a building, there can be no doubt in this case as to its beauty and the refinement of its detail, nor as to its value in preserving, as it has, the remarkable sculptures with which it is enriched. The purist may shudder; but the artist will rejoice, and the historian shout aloud for joy. Bearing in mind that Sir Thomas Tresham was a scholar and a mystic, we find that whereas the ruling principle of the Triangular Lodge is 3, here we have as a basis the numbers 4, 5, 7. The plan is a Greek cross with 4 equal arms; and not only so, but each side of each arm is equal, measuring 23ft. (see sheet III.). The way in which this somewhat curious number (23) was obtained, seems to be as follows: The bay window was taken as a basis, each of its five sides being 5ft. long, and the canted side at such an angle as to be the hypothenuse of a right-angled triangle whose other sides (respectively 4ft. and 3ft.) would be formed by prolonging the adjacent sides of the bay (see Sheet II.). The distance from the side of the bay to the main angle of the building is also 5ft. This, then, gives three 5's and two 4's, or a total of 23ft. for the length of the main side against which the bay is placed. It may also be noted that, by this arrangement, the end of each arm of the cross is divided into 7 lengths of 5ft. Coming now to the elevation (Sheet I.), we find that the height from top of base to underside of middle cornice is about 11ft. 6in., or half the length of one main side. In the base itself we have in each side 4 bays of 3 shields, separated by three windows. The shields have never been carved, indeed, some of them were never fully outlined; but, judging by the Market House at Rothwell, the intention was to carve them with the arms of the county families. The total number of shields is 144, or 12 in each of the 12 sides. The windows between the shields light the basement—which is half in the ground. To light the ground-floor we have in each main side a window of 4 lights, and in each side of the bays 2 lights, except where the main entrance is. We now come to what is perhaps the most remarkable feature in the building, the middle cornice. This is enriched with 7 remarkable emblems (see Sheets I. and III.), which occur in regular succession with certain exceptions. Taking the end of any of the arms of the Cross, we find that in each of the 7 lengths of 5ft. occur two emblems. Starting on the extreme left (on the main wall), they begin with those marked I. and II. (see Sheet I.), and run up to VII. (see Sheet III.), they then start again on the front face of the bay with No. I. and II., and run up to VI., starting again on the main face with I. and II. Therefore, on the 3 chief faces of the ends of the wings are placed the emblems I. and II. Now, turning the right-hand corner and going down the main side of one wing, we start with No. III. (thus continuing the sequence from the bay side), and run regularly up to VII , a second series of 7 ending in the inner angle. Starting again from the inner angle, we begin with No. III. (I. and II. being quite omitted), and finally finish in regular succession with No. VII. at the outer angle, ready to begin the next bay side with No. I. as already described. There are consequently 12 emblems in each of the unbroken sides of the wings. It is unnecessary here to describe the emblems, that being done on Sheet IV., but it will be seen that the numbers 3, 4, 5, 7 still play an important part in the arrangement. The trefoil (in the band of No. I.) is from the arms of the Treshams. In No. II. it is difficult to explain the letters E. T. N. on the wreath. Can anyone make a suggestion? The ladder in No. I. has 5 rungs, that in No. VI. has twice 5, the 3 dice in No. VII. have each 5 pips, and so on. The carving of these emblems is very careful, but the arrangement is rather stiff and formal. Much of the work is as sharp to-day as when it was executed, partly owing to the excellence of the stone (a local stone from Stanion), partly to the protection of the overhanging cornice. The windows of the upper floor are similar to those of the ground-floor, but taller. We come now to the upper cornice or entablature, in the frieze of which are incised legends, as is also the case in the Triangular Lodge and Rothwell Market House. And here we have further evidences of Tresham's ingenuity. He chooses such legends (always in Latin) as shall fit as nearly as possible the various sides of the building, allowing one lineal foot to each letter. Thus in the Triangular Lodge, each side of which is 33ft. long, there are 33 letters. At Lyveden the same idea is carried out. On the sides of 23ft. are 23 letters; on the breaks of 5ft. are 5 letters. The legends commence on the north face of the north wing, by the main entrance, and each of the 7 lengths of 5ft. contains a word of five letters; the first of these, IESVS, being emphasised with a trefoil next the I (see Sheet I., also upper plan, Sheet III.). It will be seen that on the main wall to the left of the bay window, we have the word IESVS, and to the right the word MARIA. Now, if we look at the west wing and supply from "Bridge's" the words now missing, we find that we have the same arrangement, IESVS to the left, and MARIA to the right. On the east wing, too, the word MARIA would come in a similar position. We may conclude, then, that this idea was carried out in each case, but no record exists of the inscription previous to Bridge's time. The legends end on the east side of the north wing, thus completing the circuit of the building, and, whether by design or chance, the last inscription has one letter less than the number of lineal feet to be filled. This difficulty is surmounted by introducing the monogram XP, which forms a fitting termination to the whole. Internally, the building is finished with as much care as on the outside. From the front door on the ground-floor a vista is obtained right through the building. The arches are all of wrought stone, many with elaborate panelling; but are very difficult of access, as all the floors are gone. There are 4 rooms on each floor. The largest in the basement is evidently the kitchen, but it is very badly lighted. In the bay at the back of the fireplace are large ovens not shown on the plan; they are built outside of the main wall, under the ground. The south wing was probably entirely devoted to the staircase, and the other two rooms to stores, &c. On the ground-floor to the north wing would be the entrance-hall, the south wing the staircase, the two others habitable rooms with fireplaces. In the N.W. corner of the north wing or hall, and about 7ft. from the floor, is a square projecting niche, which may have been intended for Sir Thomas's patron saints. The east room on this floor is the only one which has the bay thrown into it. On the keystone of the arch leading to the bay are two shields, bearing respectively the arms of Tresham and Throckmorton, Sir Thomas having married Muriel Throckmorton. The doorways leading into the south wing or staircase, both on this floor and that over, are grouped into a striking feature on the side next the staircase, but none of their mouldings are entirely finished. On the upper floor, besides the staircase, there would be three habitable rooms with fireplaces. That in the west wing is the most important, or, at least, has the most elaborate fireplace, and was possibly intended for the use of Sir Thomas himself. It is in this thick wall over the kitchen fireplace that we should first look for signs of one of those secret hiding-places which were not unusual in the houses of the Catholic gentry in Elizabeth's time; but there does not seem to be any reason to suppose there was anything of the kind here. Of Sir Thomas Tresham's object in building this place we have no knowledge. Whether the numerous sacred emblems about the place are indications of its being built for religious purposes, or whether they are merely the inevitable expression of a mind so mystic as Sir Thomas's, it is difficult to determine, but the general air of the building is distinctly secular. But whatever its primary object, Lyveden was never so far completed as to fulfil it, and we probably see it now in much the same state as it was left. One of Cromwell's colonels is said to have tried to demolish it with cannon, but there are no evidences of such an attempt, though I believe it is true that he carried away the floor-timbers to use in his own house; the ends are still embedded in the walls. For this action of his, the man who measures the building is likely to be otherwise than grateful.

J. ALFRED GOTCH.

SCHOOL OF ART, LIVERPOOL.

WE illustrate this week the first premiated design, by Mr. T. Cook, architect, 12, St. George's-crescent, Liverpool. The areas of the various rooms were named in the conditions furnished by the committee to the competitors. They amounted to 6,936 supl. feet. The areas in this design amount to 7,186 supl. feet. All the rooms have north lights exclusively, except two, which have an east light in addition. Fresh air is admitted to all the rooms by Tobin tubes, and the foul air is extracted by vitiated air-flues, carried up with the smoke-flue from each fireplace, and also by additional flues in outer main walls, connected to Boyle's air-pump ventilators on ridges of roofs, by air-tight trunks. The building will be faced with Hollington stone.

MORNING-ROOM DECORATION.

LAST week we illustrated a Gothic interior from the Royal Academy Exhibition, 1880, and to-day, from the same exhibition, we publish the side elevation of a morning-room in a later style, rather Jacobean in character. Mr. Walter Hensman, of Shepherd's Bush, W., is the architect of the work. The details underneath the general drawing include enlarged parts of the frieze and general wall-surface decoration.

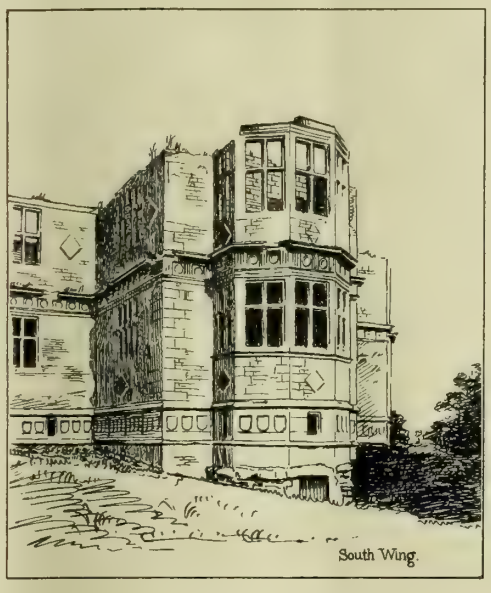
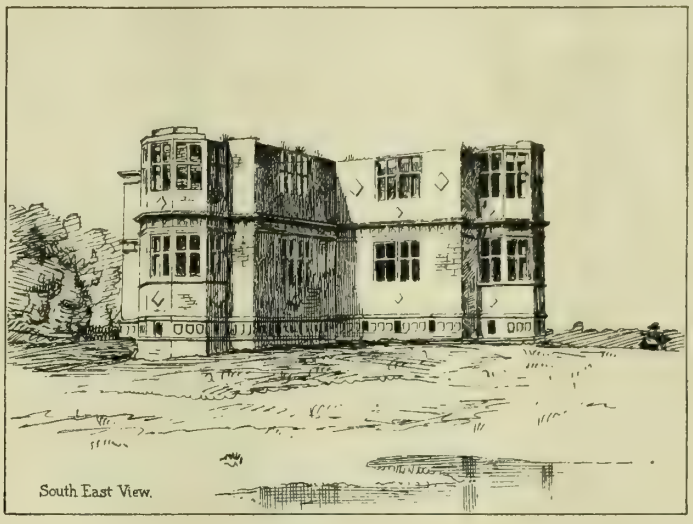
LYVEDEN NEW BUILDING



South Wing.



South East View.

Explanation of Emblems

I Within the band; the Pillar, the Cross with crown of thorns, the Ladder, the Sponge and Spear with a Heart between them, a Cord (or Scourge?) in form of an S. The whole making monogram IHS.

II The monogram X·P· surrounded by a wreath of leaves, bearing on three bosses the initials E.T.N.

III Judas's Money-bag, surrounded by the thirty Pieces of Silver

IV A twisted Cord circumscribing swords, halberds, torches, and a lantern. To one of the swords is adhering Malchus's ear.

V Within a twisted linen wreath are the Scourge, the Pillar and crown of thorns, the Sceptre of Reeds On the Pillar stands the Cock, & round it is twisted a Cord.

VI A Crown of Thorns surrounds the Ladder, the Cross with crown of thorns, the Sponge, Spear Hammer and Pincers.

VII The seamless Garment, between three dice. In the circumscribing band are helmets and gauntlets.

VII^TH EMBLEM

Legends in Upper Cornice.

[IESVS NVNDI SALVS

[MIHI AVTEM A]BSIT GLORIARI
NISI IN CRVCE DOMINI NOSTRI X.

Of the above the portions in brackets are no longer extant; they are supplied from 'Bridges' Northamptonshire': but even in Bridges time (cir 1700) there must have been much missing, as the legends given by him would not extend round the whole Building. On the south face of the South Bay is legible TEAMA.

EBERHARD AND CO.'S PATENT PARQUET FLOORS.

WE have lately had brought to our notice a new method of laying parquetry, which promises to supersede the usual mode of application. Messrs. Eberhard and Co., of Edward-street, Hampstead-road, the inventors of this system, have recently laid down a parquet floor at Marlborough Rooms, Regent-street, not upon the usual wooden ground, but upon a cement foundation, and it is this particular application of it that calls for notice. The room in question is about 40ft. square, and is to be used for assemblies, banquets, and balls, and the old floor consisted of brick arching resting on iron girders and finished with concrete and cement. The surface had become cracked and uneven. A floor of parquetry was decided on, and Mr. Tyler, the architect of the alterations, finding the usual system of laying impracticable, applied to Messrs. Eberhard to undertake the work, which has been performed in a manner highly satisfactory. Messrs. Eberhard's process consists in fixing the parquetry upon an adhesive bed of their patent glue—a composition at once hard, impervious, and capable of forming a level surface for the parquet. This "patent glue" can be floated upon the most uneven kind of flooring without recourse to any other preparation, and the result, from a personal inspection of it on both cement and boarded floors, we consider, can be confidently recommended to the profession. At the Marlborough Rooms, it was necessary to make up the sunk portions of the floor with the patent composition—a difficulty which is at once removed by its use, and on this account it becomes a most valuable groundwork for parquetry upon staircases, corridors, and landings, where the traffic and wear are constant and great. At Messrs. Meeking's premises in Holborn, it has been successfully used for the latter purpose on the principal stairs of stone, which had become worn to a considerable extent, in some places, we hear, as much as an inch and a half. But another advantage of this mode of laying is that it saves quite 30 per cent. of material, and enables parquet of 3-8ths of an inch in thickness to be used, instead of the usual inch stuff. It must be obvious to anyone who knows how ordinary parquetry is made, to see that its wearing surface is not more than that thickness, as directly 3-8ths of the stuff is worn down the tongues are exposed. In reality, therefore, the 3-8th of an inch parquet laid by Messrs. Eberhard is quite as lasting as the inch, while the solidity, permanency, and imperviousness of the bedding are superior in many respects to the ordinary system of laying down. A large drawing-room in Grosvenor-square, which we also inspected, shows that the patent glue can be used with equal advantage upon ordinary floor-boards, their uneven and worn surfaces being made up by the composition. The glue is simply spread over the surface after heating, and the parquet squares pressed upon it. In a moment after the parquet becomes immovably fixed, and after setting, nothing will separate the two without splitting the wood. We understand the cost of laying a plain Stettin oak star-like pattern is 2s. per foot super for the centre, and 2s. 6d. for the border. The firm supplies flooring to the trade from 7d. per foot, their "patent glue" being £4 per cwt. The permanence and solidity of the bedding, its impermeable nature, and especially the great economy effected by a reduction in the thickness of the parquet, recommend Messrs. Eberhard's system to the attention of all architects.

THE CAPITALS IN THE CRYPT OF CANTERBURY CATHEDRAL.*

MR. J. DONKIN, architect, has just brought out a small volume of illustrations of the capitals in the crypt of Canterbury Cathedral. Every visitor to that grand old structure must have noticed the great crypt which forms one of the chief attractions of the cathedral. No English crypt can compare with it in size or architectural importance, and it is not remarkable that the author should have been tempted to transfer to paper the various grotesque carvings on the capitals of the pillars which support the vault. Many of the ornaments are certainly very early Norman, and the general opinion of antiquaries points to the year 1073, as the date of the rebuilding of the crypt by Archbishop Lanfranc. Subsequent alterations were made, however, and the pillars were, as the author says, readjusted to suit the rebuilt choir above. We have already reproduced several of Mr. Donkin's drawings in our pages. These capitals are executed with great vigour, though they are essentially rude, and the author thinks, not without reason, that the subjects represented by the carver may have been dictated as much by fancy as by the desire to produce allegorical designs. There are no less than 24 plates of lithographs: two represent views of the great crypt as rebuilt about 1095, and the eastern crypt, the original burial-place of Thomas à Becket, built by William of Sens about 1175 A.D. The figures in the capitals of plates III. and IV. are exceedingly grotesque and spirited; the faces of the knights or crusaders represented are almost comic in their features. The subject in another capital is certainly more symbolic—a ram's head, made to resemble a man, and the arms, holding a fish in one and a cup in the other, are Christian emblems, but the winged animal upon the neck of capital is not so clear. In the next capital is a representation of a half-human being with double head, riding on a peacock, the symbol of the Resurrection, and this one and those on plates 10, 18, and 21, are striking examples of clever symmetrical and decorative treatment.

* The Capitals in the Crypt of Canterbury Cathedral. Described and illustrated by J. DONKIN, Architect. London: W. J. Johnson, 121, Fleet-street.

ST. MARK'S, VENICE.

THE following circular letter has been addressed by the St. Mark's Committee to their foreign members:—

St. Mark's Committee,
9, Buckingham-street, Strand, W.C.
18th January, 1881.

SIR,—I have the honour of bringing to your notice the resolution passed at the General Meeting of the St. Mark's Committee of the 17th instant.

In consequence of an address delivered by Cavaliere Azzurri on the 29th October, 1880, in the course of which the Cavaliere, who is President of the Academy of St. Luke, deplored the recent restoration of St. Mark's in these words:—"It is indisputable that the injuries inflicted upon the characteristic value and integrity of this building by these works are of the gravest kind," and expressing in the name of the Academy their sympathy with the object of the Committee, the St. Mark's Committee considered it their duty to put themselves in communication with the Academy, and have adopted the following address:—

"To the President of the Academy of St. Luke.

"The St. Mark's Committee, at a General Meeting held at the residence of Mr. G. E. Street, R.A., Professor of Architecture at the Royal Academy of Arts, London, desires to thank you for the manner in which you have expressed your opinion upon the subject of the preservation of the basilica of St. Mark. This Committee expresses its profound satisfaction to find, by the letter and speech of your Honourable President, Count Azzurri, that he entirely agrees with this Committee upon the question, and is desirous of making the Academy the intermediary of all communications the Committee may have to make with regard to the building. The Academy of St. Luke may well be considered in virtue of the illustrious names among those of your own countrymen, as well as the many distinguished foreigners who enjoy its membership as the authoritative representative of the internationality of art, and the Committee hopes to find in the Academy a firm basis of support and a judicious appreciation of the sentiments which inspire any observation the Committee may feel it necessary to make on the subject.

"HENRY WALLIS, Hon. Secretary."

METROPOLITAN BOARD OF WORKS.

THE weekly meeting of this board was held on Friday, when a deputation from the Lewisham and Lee Inundation Committee attended to present a memorial, signed by 3,000 persons, on the subject of floodings in the districts of Lewisham and Lee. It was stated that these floods resulted from the overflow of the rivers Ravensbourne, Quaggy, and Poole, the outfall of which was in another district, and also from the storm-overflow from one of the Metropolitan main sewers into the Ravensbourne at Catford-bridge. The memorial was referred to the works committee.

It was decided to inform the vestry of Newington, in reply to a letter as to the action of the Lambeth Water Company in cutting off the water supply to certain houses in that parish, that the board will on the first opportunity consider as to obtaining an alteration of the existing law, and will do their utmost to protect the interests of the consumers. A report was received from the fire brigade committee, submitting the names of six candidates for the post of second officer in the Metropolitan Fire Brigade, from amongst 105 applications. Mr. J. S. Simonds was elected.

A report was received from the Parliamentary committees as to the tramway schemes and bills, recommending that consent be given to the North London Suburban, the Woolwich and South-East London, the Canning-town and Plaistow, and the Shepherd's Bush, Gunnersbury, and Kew Tramways schemes, with reference to which provisional orders had been applied for to the Board of Trade; and also to the Lea Bridge, Leyton, and Walthamstow, and the Southwark and Deptford Tramways Bills, on undertakings being respectively given to amend the Bills in Parliament. This was agreed to with the exception of the Kew scheme, reserved for further consideration.

The prevention of floods committee presented a report, which was adopted, recommending that the Victoria, Albert, and Chelsea Embankments be protected from overflow to a further extent of 6in., viz., to 5ft. 6in. above Trinity high-water mark, instead of 5ft. as at present, and that the engineer be instructed to prepare plans. The engineer's plans for the prevention of floods in the Chelsea District were submitted and approved, with the alteration of height from 5ft. to 5ft. 6in., and it was decided to vary the height of the works already ordered in Westminster in similar manner, and to require the owners of river-side property who have already raised their walls, to comply with the new regulations; those who have raised them to be advised to add another 6in. to their walls. It was explained that the former limit was fixed because experience showed that no high-tide had ever risen over 4½ft. over high-water mark, but the tide of the 18th Jan. reached a maximum of 5ft. It was further reported that two-thirds of the owners of river-side property had complied with the new regulation and raised their walls to the 5ft. limit.

COMPETITIONS.

HOUSE SANITATION.—The Council of the Society of Arts offer the following medals for plans showing the best sanitary arrangements in houses built in the metropolis, such plans to be exhibited in the Society's Rooms, Adelphi, in June, 1881, and to be sent in on or before 12th May, 1881:—1. One silver medal for the best sanitary arrangements, carried out and in satisfactory working, in a house let out in tenements to artisans, for which a weekly rental is paid. 2. One silver medal for the best sanitary arrangements, in actual working, in a house of the yearly rental of £40, or less, to about £100 in value. 3. One silver medal for the best sanitary arrangements, in actual satisfactory working, in a house of the yearly rental value of £200 and upwards, to any amount. 4. The houses must be open to the inspection of the judges, who, in considering their award, will be guided by the suggestions of plans for main sewerage, drainage, and water supply, made under the Public Health Act, 1875. The houses must have been in actual occupation within the last three months, and a certificate must be given by the occupiers, on a printed form, stating the satisfactory working of all the sanitary arrangements, such form to be obtained at the Society of Arts. 5. The houses may be old, fitted with modern sanitary arrangements, or may be new. They must be within the metropolitan area of the Board of Works. 6. The sanitary arrangements must include the conditions for good water supply, drainage, warming, and ventilation of the house, and precautions taken against frost. 7. The medals may be awarded to the occupiers of the houses, or the lessees, or the owners. 8. The plans must consist of a ground-plan and sections, to the scale of not less than one inch to five feet; details of not less than one inch to the foot; the plans may be accompanied by specifications. 9. The names of the architects, surveyors, or sanitary engineers who directed the sanitary arrangements should be given, and certificates will be awarded to those whose plans obtain the medals.

KENDAL.—The design of Mr. D. Brade, of Kendal, submitted under the motto "Leviticus," for the proposed hospital for infectious diseases in Kendal, has been selected by the corporation. The design marked "Sylva," also by a local man, Mr. Martindale, was considered by the committee very good, but was rejected because the cost exceeded the stipulated sum (£1,200) by

£600. Only one other plan, "Health," was received.

NEWBURY.—Mr. Alfred Waterhouse having been called in to advise the trustees, examined the plans last week, and the first premium of £50 for the best design has been awarded to Messrs. Power and Hughes, of Leadenhall House, London, the second premium of £25 going to Mr. Chas. H. M. Mileham, of 114, Gower-street, London. Our review of the designs appears elsewhere.

PIETERMARITZBURG.—The town council of Pietermaritzburg, South Africa, received 15 sets of plans, some from England, others from the Cape, for a new town hall, proposed to be erected on the Market-square, facing Commercial-road, at a cost stipulated not to exceed £20,000. The committee appointed to consider the designs were assisted by professional advice, and awarded the first premium (£100) to the set with the motto "Africa," the second, of £50, to "Labor Omnia Vincit." It was found the former had been sent by Messrs. Welchman and Reid, of Grahamstown.

THE ROWLAND HILL MEMORIAL.—Sir Frederick Leighton, P.R.A., Mr. Calder Marshall, R.A., and Mr. Woolner, R.A., who acceded to an invitation of the Rowland Hill Memorial Committee to adjudicate upon the various models sent in by competing artists for a statue of Sir Rowland to be erected at the Royal Exchange, have decided that a model, which proved to be the work of Mr. E. Onslow Ford, gives the best promise, but they advise that the artist should be requested, before the commission is intrusted to him, to send in another design on a larger scale.

SELBY SCHOOLS COMPETITION.—In response to the invitation to architects to prepare plans for the new schools and alterations to the chapel, about 35 sets of drawings were sent in, and the committee, after carefully considering the merits of the respective sets of designs, selected six for final consideration bearing the following mottoes, viz., "Raikes," "Experience" (motto in red lettering), "Experimental," "Liverpool," "Spes," and "Wesleyan." At a subsequent committee meeting this number was reduced to four, "Spes" and "Wesleyan" being put aside, and it was finally decided to place the remaining four designs in the following order of merit, viz.:—1st, "Experimental"; 2nd, "Liverpool," by C. O. Ellison, of Liverpool; 3rd, "Raikes," by E. Birchall, of Leeds; 4th, "Experience," by William H. Thorp, of Leeds. We have not heard the name of the successful architect who is to carry out the work, but understand that he is a Manchester man. "Liverpool," by C. O. Ellison, of Liverpool, receives the second premium, and "Raikes," by E. Birchall, of Leeds, the third.

CHIPS.

Plans for a new church at Lawkholme, Keighley, at a cost of £2,600 for nave only, without pews, are being prepared by Mr. J. Bailey, architect.

The parish-church of Chaceley, Gloucestershire is about to be restored from the designs of Mr. Ewan Christian, at an estimated cost, exclusive of the chancel, which will be undertaken by the Ecclesiastical Commissioners, of £1,500.

A new peal of bells have been presented to the parish-church of St. Oswald, Compton Abdale, by the vicar. The bells are six in number, replacing four smaller ones, and were cast by Messss. Warner and Son, of London; Messrs. Savory and Sons, of Painswick, erected the frame.

Mr. Robert Morgan, C.E., as Local Government Board inspector, held an inquiry at Derby on Thursday week in regard to a petition presented by the Corporation for the issue of a provisional order as to the acquisition of certain lands for the building and improvement of streets, and also to an application for sanction to borrow £5,650 for works of street improvement. The plans were explained by Mr. Coulthurst, borough surveyor, and no opposition was offered to the proposals.

Mr. Edwin Crossland, timber merchant, Halifax, was seriously injured on Wednesday week, while inspecting the boiler at his works, by the fall of the weight attached to the boiler, which fractured one of his thighs in two places and also injured his back.

We understand that a very effective design for the proposed cathedral church for the Isle of Man has been prepared by Mr. J. Pitt Bayley, architect, Fulham-place, Paddington, W. The drawings, which are accompanied by a report, are in the hands of the High-Bailiff of Douglas.

Building Intelligence.

BUILDINGS IN BIRMINGHAM.—The following is a return of new buildings, either erected or for which plans were approved by the borough surveyor, during the year 1880, together with the returns for the previous years:—

	1880.	1879.	1878.	1877.	1876.
Houses and shops	1,301	1,197	1,205	2,700	2,903
Churches	—	—	—	1	1
Chapels	1	—	1	3	5
Schools	—	—	4	6	6
Manufactories and warehouses	64	102	64	86	107
Miscellaneous	71	101	96	90	43
Alterations, &c.	222	225	290	167	52
	1,659	1,625	1,660	3,053	3,177

Under the class "Miscellaneous" are included —County-court, nurses' home and burn ward at the General Hospital, Free Library (Constitution-hill), library for the Society of Friends, St. Agnes Home and Orphanage, the drill-hall (Thorp-street), additions to the Society of Artists' rooms, two assembly-rooms, the Junior Liberal Club, the new arcade, premises for the Household Supply Association, club and institute, &c. The number of plans submitted for approval for the past year was 510.

EAST THORPE.—The corner-stone of St. Paul's Church was laid at East Thorpe, Mirfield, on Tuesday week. The church is on plan a parallelogram, 97ft. long by 49ft. wide inside the walls, and will be divided by arcades of seven bays, forming a nave and chancel, with aisles of equal width through, the main span being 18ft. 6in. and the aisles each 13ft. wide. The style adopted is 14th-century Gothic. The columns of the arcades will be of Dalbeattie granite monoliths, placed on octagonal stone bases. The seats throughout will be of oak; the chancel-floor is raised four steps above the nave, and will be seated with stalls for a choir of 40 voices. A principal external feature will be the tower, which will be 20ft. square, and will consist of four stages, including an organ-chamber immediately over entrance, and will have a stone gabled roof, finished with wrought-iron cross. Great difficulties have been experienced in laying the foundations, the site being of gravel and sand, which formerly was the bed of the river; but these have been overcome by a liberal use of concrete, put in to an average depth of 11ft. Mr. W. Swinfen Barber, F.R.I.B.A., of Halifax, is the architect, and the contractors are Messrs. William and Joshua Milner, masons; Mr. George Charnock, carpenter; and Mr. John Naylor, plumber, all of Halifax.

SHARROW.—ST. ANDREW'S (NEAR SHEFFIELD.)—The interior art-decoration of this church, on a somewhat extensive scale, has just been completed. The treatment of the chancel exhibits a great amount and variety of elaborate yet congruous and chastely harmonious ornamentation, inframing and surrounding entablatures containing the principal mural subject-frescoes. These are, on the north side, the Twelve Apostles, with their respective emblems, the legend beneath being, "The glorious company of Apostles praise Thee"; and on the south twelve of the Prophets, with the subjoined legend, "The goodly fellowship of the Prophets praise Thee." The figures and entablatures, of which the ground is dead gold, are in spirit fresco, their subdued effect depending mainly on outline, with but a sparing use of colour, yet all sufficiently distinctive. The whole chancel-work is on a vellum-coloured ground, diapered and lined in ashlar pattern, surmounted by a richly-ornamented frieze. A dado in dusky red carries the sacred monogram, I.H.S., round the entire chancel, the principals of the roof being also richly decorated in gold, red, and black. The whole interior of the church has also been painted, coloured, and murally decorated, the richer and more pronounced decorations being, however, confined to enunciating the salient features of the architecture. Above all the principal windows and large arches are elaborately-ornamented ribands, emblazoned with various text legends. The designs were prepared and the whole work executed by the art firm of Powell, Brothers, Leeds, who have also been intrusted with the decoration of the organ and pipes.

TEWKESBURY ABBEY.—The Tewkesbury Abbey Restoration Committee met last week, when, after a discussion on a letter received from their architect, Mr. J. Oldrid Scott, respecting the restoration of the west front, it was resolved, "That there being conflicting opinions on the part of the architect and members of this committee with respect to the restoration of the west front, the further consideration of the same be postponed until the opportunity arises for the architect and the committee to have a personal conference." An offer by Mrs. Glynn of £300 for a stone pulpit, to be constructed from a design by Mr. Scott, was accepted with thanks, as was also one from Sir Edmund Lechmere, chairman of the committee, of £150, to be expended in the restoration of the morning apsidal chapel, under Mr. Scott's direction; this was in place of an offer of £125 for a canopy to font, which will be provided by Mr. and Mrs. B. T. Moore. A letter was read from Mr. Charles Stanton, of Upfield, Stroud, offering to restore the figure of the Virgin and Child, in the niche over the north porch, at a cost of £75, but as their architect doubted the desirability of interfering with the remains of the ancient figure and niche, it was decided to submit Mr. Scott's opinion to Mr. Stanton for his consideration.

WEST BROMWICH.—The mission church of St. Michael and All Angels, West Bromwich, was opened on Tuesday last by the Bishop of Lichfield. It has been erected at the sole expense of the Rev. H. Jesson, curate in charge, from the designs of Messrs. Wood and Kendrick, architects, West Bromwich, by Messrs. Stockton and Sons, builders, Oldbury. The church consists of nave capable of seating 250 persons, also chancel, sacristy, baptistery, and choir vestry. The materials used are brindled bricks and Portland stone. The chancel is separated from nave by an elliptical-moulded arch, in the centre of which is a massive rood-screen. The chancel contains seats for choir, sedilia, and piscina, the roof being supported on hammer-beam principals. The design of the church is 14th-century Gothic, and it has cost £1,500.

CHIPS.

Apropos of the recent stoppage of water-pipes by frost, the *South London Press* suggests that the duties of district surveyors might be, with advantage, enlarged, so as to insure that houses in course of building should be so supervised that the water-pipes connected with the main should be laid sufficiently deep, and brought into the house, as to escape the freezing of their contents, and the stoppage of the water supply of the family. At present, the pipes are too often laid but a very few inches from the surface.

At a meeting held at Drogheda on Sunday, plans prepared by Mr. P. J. Dodd, of that town, architect, for a new Roman Catholic church of St. Mary, were approved, and £4,150 was subscribed in the room towards the cost. It will consist of nave, aisles, bell-tower, chancel, and two side-chapels, and two sacristies. The outside dimensions will be 135ft. by 65ft., and the tower is to be 196ft. high. The foundation-stone will be laid on March 25th.

The St. Pancras Ironworks Co. have issued a neat and appropriately designed calendar for 1881, exhibiting a design for an entrance-gate.

At the annual meeting of the Gloucester and Bristol Diocesan Church Building Association, held on the 27th January, the following grants were voted:—For churches: Whitehill, £80; Crudwell, £60; Brimscombe, £50; Shorncote, £40; and Aldworth, £30. For schools: Eastington, £35; Northleach, £20; Minchinhampton, £20; Broad Blunsdon, £15; and Oakbridge, £5.

A coffee-tavern was opened at Milton-next-Sittingbourne on Thursday, Jan. 27th. It has been built by Mr. John Seager, of Borden, from the plans and under the superintendence of Mr. W. L. Grant; the cost has been £1,140, exclusive of purchase of site.

New borough offices are in course of erection at Poole, from the designs and under the superintendence of the borough surveyor. Mr. Morris is the contractor.

A stone monument, weighing about 30 tons, has been constructed by convicts in St. Mary's Prison, Chatham; it is to be removed to Portsmouth, and set up in front of Haslar Hospital, as a memorial to the officers and men lost in the training-ship, *Eurydice*.

Mr. E. E. Croucher, land-agent and auctioneer, has removed from 38, Southampton-buildings, to more commodious offices on the ground-floor of No. 76, Chancery-Lane (three doors from Holborn). His branch-office at 223, Seven Sisters-road, N., will be continued as before.

More than Fifty Thousand Replies and Letters on subjects of Universal Interest have appeared during the last ten years in the ENGLISH MECHANIC AND WORLD OF SCIENCE, most of them from the pens of the leading Scientific and Technical Authorities of the day. Thousands of original articles and scientific papers, and countless receipts and wrinkles embracing almost every subject on which it is possible to desire information have also appeared during the same period. The earliest and most accurate information respecting all new scientific discoveries and mechanical inventions is to be found in its pages, and its large circulation render its the best medium for all advertisers who wish their announcements to be brought under the notice of manufacturers, mechanics, scientific workers, and amateurs. Price Twopence, of all booksellers and newsvenders. Post free 2½d. Office: 31, Tavistock street, Covent-garden W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.
(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. R. M. TUTTLE, of 13 and 15, Laight-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Cases for binding the half-yearly volumes, 2s. each.

NOW READY,

Handsomely bound in cloth, Vol. XXXIX. of the BUILDING NEWS. Price Twelve Shillings. Order at once, as only a limited number are bound up.

N.B.—Cases and vols. must be ordered through a bookseller or newsagent, as the regulations of the Post-office prevent them from being sent by post.

PONTEFRACT TOWN HALL.—ERRATA.—The authors of the design placed first in this competition are Messrs. Perkin and Bulmer, of Leeds, and not Mr. Perkins, as stated in our last issue.

RECEIVED.—A. S. and Co.—B. of K.—W. M. F.—G. S. S.—J. H.—H. U.—F. W. R. and Co.—R. B.—F. and B.—G. B. and L.—A. B.—R. P. C. Co.—T. W. and Son.—W. J. B.—W. T. and Sons.—J. T. and Son.—A. H. B. and Co.—S. and Co.—S. P. and Co.—M. and Co.

"BUILDING NEWS" DESIGNING CLUB.

J. W., J. SMINT, AND OTHERS. (The rules and conditions of the Designing Club appeared in the BUILDING NEWS of Oct. 22, 1880.)

Correspondence.

THE ARCHITECTURAL MUSEUM.

To the Editor of the BUILDING NEWS.

SIR,—You are at all times willing to do an act of justice: will you kindly do me one? In your report last week of the annual meeting of the Architectural Museum, at which Mr. Lomax, the sub-secretary, was present, it is stated that the very foundation of the institution was built on the idea of tempting the workmen of our day by the placing before them fine examples of the old and past arts of architecture and sculpture, and by the award of premiums for the rendering of these on paper; in other words, of making drawings more or less elaborate and finished, of such details on paper, just, indeed, as is now done every day, and year after year at the Royal Academy, and at the British Museum, at South Kensington, and other schools. Will you allow me to say that it was *not* the extension of this idea, but its very reversal, which founded the museum in Cannon-row? When I first saw the late Sir G. G. Scott on the subject of the museum and school attached, I tried to show him how much was lost by the then, as now, universal system of learning *to draw* as it is termed, the more especially when the workman is the subject of it; and I reminded him that in the old Gothic days, when the workman was at least a something, and a *power* in art, that even the very paper on which we work so industriously did not exist to draw on, and that consequently the art-power of the workman, whatever it might be, must have been brought out and utilised in some other way. There can be, as I think, no sort of doubt as to *how* this was done: the workman, in whatever material he worked, commenced as he ended on that—e.g., the stone-carver learnt to carve and draw in the stone itself, and thus worked out a result even in the very act of learning his trade. That it is a subject of great difficulty and must wait for the future none can doubt; but, considering the universality of the present system, I have thought it but fair, to an all-but-forgotten idea, to remind your readers in the art world of it.—I am, &c., C. BRUCE ALLEN.

BRIGHTON CLOCK-TOWER.

SIR,—If any of your numerous readers have, like myself, sent for particulars of the above competition, they may perhaps be interested in the inclosed reply, if you can find room for it. It seems to me high time that architects should decline to have anything to do with competitions *on any terms whatever*.—I am, &c.,

W. S.

COPY OF LETTER TO THE BRIGHTON TOWN CLERK.

SIR,—I beg to thank you for sending me particulars of the proposed clock-tower competition.

I must say that I am astonished at the consummate impudence of the town council in issuing such a proposal to the profession, and still more at the fact that architects can be fools enough to send in designs on such preposterous conditions.

You coolly ask not only for complete working drawings and specifications (each set of which are worth their 5 per cent.), but for a detailed estimate, which involves taking off the quantities and pricing them out (a labour which alone is worth 2½ per cent. each set); and for the whole of the sets sent in you offer in payment altogether a beggarly sum of £45, which would not pay for one set of properly-made drawings without the quantities.

Moreover, you do not appoint any known competent person referee, and you have the additional meanness to stipulate that if a premiated design be carried out, the twopenny premium shall be merged in the commission. I wish the competitors joy of their job! They will richly deserve the reward they will get.—Yours,

VERY DISGUSTEDLY.

"DE REBUS GESTIS ET QUIBUSDAM ALIIS."

SIR,—The excellent letter from Mr. Buchan in your issue of 28th inst., is a valuable contribution to the clearing up of the vexed question of inside or outside soil-pipes. One solid fact, backed by common-sense and practical knowledge, is worth a bushel of theory, and I apprehend if architects and engineers, in conjunction with reliable and competent tradesmen, continue to approach the question in the spirit of your correspondent, they, with the general public, may safely leave the scientists and other amiable, but withal crotchety, enthusiasts, to speculate over, and fight out the "Battle of Stinks" to their hearts' content. Within the past few days on one of my own works (an alteration of an old house) where I had occasion to order the removal of a defective internal lead soil-pipe, and refixing a new one externally with the "Norman Shaw" open hopper arrangement, the w.c. was frozen up with the soil-pipe during one of the severest nights of the recent storm. It is true the bath and lavatory wastes emptied into the same hopper, and were the primary cause of the mischief, but I doubt not in their absence the same result would have followed. At the foot of this lead soil-pipe I had one of Mr. Buchan's excellent ventilating traps according to my usual custom, and it was was frozen up also. The situation, on the top of a hill, was unusually bleak and exposed. I have ordered the removal of the open hopper, and the running up of an iron ventilating pipe above the roof level, and the soil-pipe is to be cased with wood, packed inside with slag wool or felting (an excellent non-conductor, by the way). As to the freezing of the Buchan's trap, I have reason to believe the frosty wind from a brook at the foot of the hill into which the drain emptied had access up the length of it, as the drain was partially frozen up at the mouth.

I should like to hear from some of your correspondents if, after all, it is quite clear that a properly fixed internal soil-pipe is not, under certain conditions, better so fixed.

From traps and soil-pipes to the new font about to be presented to our old parish church by the Sheffield Freemasons, is a long step. Your correspondent, Mr. H. Hems, with whose racy letters all readers of the BUILDING NEWS are familiar, only tells half the story when he alludes to my firm keeping clear of the font competition, out of consideration for the architects employed on the church restoration. That had something to do with our decision, but the primary reason was the degrading and undignified nature of such competitions which are demoralising the profession daily, and ought, with their promoters, to be contemptuously disregarded by all architects of even average practice. If such are short of work, let them fill up their own spare time, and that of their pupils and assistants, by measuring and carefully studying the nearest old work, as the writer has done many a day with advantage and satisfaction, while, per contra, he has once or twice before now reaped failure and consequent tribulations of spirit, not to say loss of pocket, from unsuccessful competitions, and as to benefit of any kind, echo answers "Where?"

One word in reply to Mr. Hems and his complimentary allusion to our works. I have these five or six years been flattering myself that our work was gradually but surely casting itself loose from all sympathy with most of the "Gothic revival work" of these 25 years past. "Clever" it is not, nor I hope ever will be, in the sense that 99 per cent. of what is usually termed "clever Gothic" earns the sobriquet.

They say, "De Mortuis nil nisi bonum"; but Rotheram Church reminds me that long before I joined the Society for the Protection of Ancient Buildings, I had a grudge against the late Sir G. G. Scott for his destruction of the old east window, with its quaint transomed lights and capital arrangement of glass space. The restored church as a result has lost scale, and got a "clever modern Gothic" window, with glass to match, by, doubtless, some eminent art firm, and crowded into it is more "clever" design and drawing than probably could be seen in the Mediæval glass of the entire church.

I have a respect for our good friend Mr. J. P. Seddon; but why on earth did not he design his font on the lines of the old one, or, for that matter, several local ones of the same date, and put thereon the old cover? Let us hope he has not ventured on a second "clever Gothic" addition to the glorious old church.—I am, &c.,

CHARLES HADFIELD.

Corn Exchange Chambers, Sheffield, Jan. 31.

MODERN DOMESTIC ARCHITECTURE.

SIR,—Where has "Delta" been looking if he cannot see that, for the last three hundred years and until quite lately, we and other European nations have been doing little else than "endeavouring to revive Greek art"?—the outcome of which effort is the eternally reiterated Corinthian capitals and Classic mouldings which line miles of streets in Belgravia, Kensington, and compose the whole of such wearisomely ugly cities—even if only for their very monotony—as Glasgow and Berlin, and of which everyone, who dares to admire what really pleases him and not what he is told by pedants is correct, is so heartily nauseated with?

It is perfectly plain that "Delta" is not one of these persons, else he would not talk about the Greek style being the noblest of all, when, as a matter of fact, it is one of the most rudimentary and unscientific—its beauty arising merely from the good taste shown in the working out of its simple construction. Certainly, if we are to throw away all the scientific and æsthetic experience we have gained from the last two thousand years, we can call ours "high art," which "Delta" so desires, but evidently does not understand.—I am, &c.,

E. A. PHIPSON.

HOUSE SANITATION.

SIR,—I beg to support Dr. Corfield in his assertion, on page 113, that "a person who is not practised in carrying out sanitary works is not competent to put his own house in order; that no amount of reading can give that practice."

I might mention a case in my own experience where a F.R.S., who was well read up in the subject and could lecture well upon it, tried it; but somehow he could not get on at all, the details bothered him, &c. He then came to me and I planned out the work with him at once, and as the workmen he had were rather inexperienced he got my foreman to look over them, while at same time doing the particular parts, and as a consequence, his mind was at once set at rest, and we have been friends ever since. So there is some truth in the proverb that "an ounce of practice is worth a pound of theory." It is better to have *both*, however.—I am, &c.,

W. P. BUCHAN, F.S.Sc. (Lond.), &c.,
Sanitary Engineer.

Glasgow, January 31.

THE WEATHER AND THE BUILDERS.

SIR,—In your article of 28 January, under the above heading, you describe Mr. Latimer Clark's suggestion to permit of the ready flow of water from melted snow in gutters. Will you allow me to point out that a serious objection to an inverted V trough is that its removal would be necessitated every time a man had to pass along the gutter to repair a broken slate, and, irrespective of the inconvenience of this, the trough itself would sure to be damaged by carelessness, to say nothing of slates being broken in its removal. A very simple means of gaining the desired end is to construct "snow boards" in convenient lengths for handling, with 3in. by 1½in. deal laths, laid ½in. apart on bearers, say 4in. deep, shaped on the lower edge, spaced at intervals of say 2ft. 6in. The snow rests on top, and as it melts drains through between the laths and the water runs freely away. These "boards" in no way interfere with traffic over the gutters, for repairs to roof, &c., they protect the metal both from sun and "hob-nails," and if they are painted every few years they will last a very long time. I have only to add that all "outlets" from gutters should, of course, be covered with domical wire or other gratings to prevent the stoppage of the pipe by leaves, &c.—I am, &c ,

EDWIN T. HALL, A.R.I.B.A.

57, Moorgate-street, E.C.

EXTERNAL SOIL-PIPES.

SIR,—Mr. Buchan asks for opinions on this subject. I hope he will give some explanation of his assertion that "a soil-pipe placed outside *generates and discharges into the air* far less sewage-gas than one fitted up inside."

He can hardly be speaking of an inside *unventilated* soil-pipe, which would discharge its gas through the trap, or otherwise, *into the house*. And if ventilated, why *should* it generate more gas if fixed externally?

If a pipe be fixed inside, and kept warm by the heat of the house, a permanent ventilation upwards is much more probable than if its external surface be chilled by the night-air. And on this account also a stoneware pipe is better than metal, especially iron. And it is less liable to get frozen. But there is no reason why it should not be protected, if external, by a casing of brickwork. During the recent frost, I have not found anything but a strong upward draught through my soil-pipe, which is not merely internal, but isolated within a larger ventilated pipe, through which, also, the upward draught is equally strong and constant.

Outside a neighbouring house I observed an external soil-pipe coated with ice for about 20ft. from the area, and surrounded with a strong fire at the foot, in a vain attempt to thaw it.—I am, &c., WILLIAM WHITE, F.S.A.

Wimpole-street.

FIGURES IN GLOUCESTER CATHEDRAL.

SIR,—The statement that the very beautiful groups and figures in the Gloucester reredos are—like the panels on the lower part of the Temple Bar scarecrow!—of plaster, is incorrect. The sculpture in question, like the rest of the reredos, is of fine Painswick stone, from the Cooper's-hill quarries. They are the work of that talented sculptor Mr. William Redfearn, of Upper Kennington-lane, London, whose early death a few years ago, all of us who knew him, as well as a wide field outside that circle, so deeply deplored.—I am, &c., HARRY HEMS.

Exeter, Jan. 29.

PROPOSED VISIT TO ROME.

SIR,—By some misunderstanding, the total cost of this visit, which I brought to the notice of the Architectural Association on the 21st ult., is given in your report as varying from £21 10s. to £25 15s. These figures should be £16 to £18, according to the route chosen.—I am, &c.

THOS. BLASHILL.

NEWBURY GRAMMAR-SCHOOL COMPETITION.

SIR,—It may be well to warn competing architects against a piece of carelessness of which we have been the victims. A carefully-drawn pen-and-ink perspective view of our design was not unpacked until after the award had been made and the drawings criticised by the reviewers. This would have remained unknown to us, had we not gone down on Monday last to see the drawings, and remarked its absence.

We are aware this would not have influenced the award, with which we fully agree; but the object of the view, to call attention to the plans, was entirely lost.—We are, &c.,

Feb. 3rd. A OUTRANCE.

Intercommunication.

QUESTIONS.

[6382.]—**Gas-Stoves.**—Will some of your numerous readers kindly give their opinion on the question of having gas-stoves instead of the ordinary fire grate in rooms throughout a house which has no special ventilation provided, and if, in their opinion, they are dangerous to health? A few days since three gentlemen fainted from sitting in a room for some hours where a gas-stove and many gas-lights were burning, and no special ventilation provided. Information on the subject will greatly oblige—J. W. W.

[6383.]—**Condensation of Windows.**—Can any reader oblige by stating from experience how to clear windows of a corner grocer's shop one side, one end plate-glass, 7ft. high? Shop 9ft. pitch, 25ft. by 16ft., entrance at corner.—X. Y. Z.

[6384.]—**Nett Measurement.**—What is nett measurement? In the measurement of granite ashlar for caisson grooves in dock-work, does it mean that the groove (about 1ft. 6in. by 1ft. 10in.) is to be deducted from the cubic quantity of the granite?—F.

[6385.]—**French Polishing.**—When sending mahogany joinery work out into building to fix before polishing, is it usual to rub in anything to keep stain and grain from rising? I am told to use linseed oil by one, and by another that if I do so the polish will not take.—ENQUIRER.

[6386.]—**Electric Bells.**—About June, 1880, I had 18 electric bells fixed in my house, all acting properly for 3 or 4 months. In rooms where there are two pushes both will act on being touched, whilst in the course of the day one or both will not act at all, and the like in the bedrooms. Some work right one day, and the next will not act. Can any kind reader of this journal explain the cause and remedy to correct the evil, and oblige? The battery is properly charged, or thought to be so.—A SUBSCRIBER.

[6387.]—**Deposit on Quantities.**—How should I act with an architect who is too mean to return the deposit money on a bill of quantities, although he has been asked for it several times? I am referring now to a case in which I have receipt for the deposit and a memo. stating that it will be returned on receipt of tender. Tender was sent in on form provided in the ordinary way, and was below the average of the list, and it is not disputed that it was bonâ-fide. I may also say that the contract has since been let and the work commenced. This instance is not a solitary one, unfortunately, as I could name several architects, some of them with good practice, who will not disgorge without considerable pressure.—BUILDER.

[6388.]—**Quantities.**—In the case of quantities for work being taken out by a quantity surveyor, is it usual and proper for the architect to divide (or receive any part of the fee for quantities), the architect being put to some amount of trouble in negotiating with the surveyor and explaining drawings and specifications, &c.?—AN ARCHITECT.

REPLIES.

[6324.]—**Norman Woodwork.**—The doubts I expressed (Dec. 10, 1880) as to the existence of Norman woodwork in this country seem to receive confirmation by the inability of any reader to give a satisfactory instance of known work of that period. The good rector of Priston, near Bath (Rev. T. H. Hillier), however, writing me a few days ago, says:—"You say you have never seen any genuine Norman woodwork. I should like you to come here and see a grand Norman door in Priston Church. Some years ago Mr. Birlescombe, then the late Sir G. Gilbert Scott's chief assistant, assured me that this door was really Norman, both as regards the wood and the ironwork." I happened to receive this letter at Macclesfield, when in company with Mr. James Stevens, F.R.I.B.A., the well-known architect of Manchester. "I remember," remarked Mr. Stevens, upon my showing it him, "that many years ago Sir Gilbert and I were both with a large archæological party who took this part of Cheshire for a ramble. We were at an old church near here, and Mr. Scott—it was long enough before he was knighted—read a paper thereon. Amongst the features of especial interest which he pointed out was an old door, the woodwork of which he defined as Norman. He called particular attention to the sturdy excellence of the work, but whilst we were all examining it intently, an old villager, who had hobbled in amongst us unnoticed, remarked, "'Cuse me, meister, I knows nought about Norman, or any of them men you've been a mentioning, but I knows you makes a mistake about that there door. It wern't no one called Norman as made it. It were wrought by my grandfather, who were a wheel-wright in t'village. I've heard my old father speak on it many a time." I shall feel very interested in learning whether any real Norman woodwork does exist anywhere.—HARRY HEMS.

[6362.]—**Damp Walls.**—The damp which you observe comes out of the vapour of the atmosphere, and not out of the object on which it forms. During the fall of temperature the air gets cooled down to its "dew-point"—*i.e.*, the temperature at which condensation takes place—the atmosphere then, being unable to contain its moisture, deposits it on the hard cold surface of the varnished paper. The same effect may be observed on bringing a tumbler of cold water into a hot room, when its surface will get covered with a mist. Your best remedy would be to place a stove in your hall, as it would tend to keep the atmosphere at a constant temperature.—H. S., Belfast.

[6362.]—**Damp Walls.**—The complaint "M. G. C." makes is entirely due to the condensation of the moisture or, rather, of the air in the house, which the varnished paper arrests while the colour-washed walls above absorb. It is a defect few houses are exempt from, and the only way of remedying the evil is to warm the hall by a gas or porcelain stove, or a hot-water coil, and well ventilated by a louvre or exhaust ventilator at the top of staircase. One of Boyle and Son's ventilators would answer. Condensed moisture rendered visible in this manner is not so detrimental to health as walls that absorb the moisture both from within and without, but which do not show it. A damp-proof course would be of use in checking the rising of moisture from the ground, but would not cure the evil complained of, which is due to condensation, and not percolation from the outside, and it is only hard, smooth, and impermeable surfaces which are subject to the complaint.—G. H. G.

[6363.]—**Choir Stalls.**—In reply to "V. M.," and also in correction of Mr. F. J. Freeman, the westernmost stalls in St. Pete.'s church, Derby, are canted towards N.E. and S.E. respectively.—F.

[6367.]—**Frost Prevention.**—One of the contrivances alluded to for preventing the bursting of pipes consists in placing in those portions of pipes exposed to cold or draughts small tubes of gutta-percha or india-rubber, sealed at the ends, which can be fixed at the points by wire. The expansion of the water or ice is thus compensated for. Another plan is to leave the tap slightly open, so that a trickle of water may be maintained. A safer plan consists in emptying the pipes and cisterns, and to have an outside stop cock so as to draw directly from the main when water is wanted. These precautions are not always practicable. To thaw pipes, cloths dipped in hot water may be applied to the frozen or exposed parts. A very easy means of ascertaining whether a boiler is safe before lighting fire is to draw off some water. If it can be drawn there is little fear of explosion.—G. H. G.

[6369.]—**Thrust of Vault.**—The method described by "S. M." is approximate, and may be considered true for vaults of small span. The weight in one compartment means the weight comprised between the two piers, or the space included between the four points of support of the diagonal ribs. Of course, the thrust acts along the diagonal rib or groin. The rule, it is hardly necessary to say, does not apply to common cylindrical vaults.—G. H. G.

[6374.]—**Jacobean and Queen Anne Styles.**—I cannot refer "J. S." to any inexpensive books treating of these styles, the simple fact being that no one has published any book treating of the details. Mr. Stevenson's recent work on Domestic Architecture deals with the style generally, but does not enter into details. I can only refer "J. S." to the illustrations of the BUILDING NEWS, which contain numerous examples, and the works on furniture that have appeared from time to time. As Jacobean and Queen Anne are really based on Classic and Gothic types, "J. S." had far better study these; he would then be commencing at the purer sources of the styles which go under these names, for he may rest assured the public are beginning to tire of grotesque exaggerations and caricatured features, and that a reaction must come sooner or later. By the way, there is an old book, out of print now, but likely to be obtained from second-hand booksellers, called Hunt's "Exemplars of Architecture," which gives examples of a few old buildings of the reigns of the Jameses.—G. H. G.

[6375.]—**Asphalte Paths.**—I should advise "Asphaltos" to prepare a good dry surface of concrete before laying the asphalte. The material may be spread in two layers, but one layer of ¾in. thick would be best for footpaths. Claridge's asphalte is well suited for the purpose, and directions may be obtained of the secretary in Surrey-street. Directions for fusing the asphalte are given in the article "Asphalte," in "Commonplace Column," Vol. XXXIV., p. 277, where the subject is treated pretty fully.—G. H. G.

[6377.]—**Incline.**—The trucks with the wheels of 9in. diameter will require the greater power to work in the proportion of 2 to 1, or the proportion of power to weight is in the ratio of the radii of the two wheels on the assumption, of course, that the trucks are of equal weight, and the direction of force is parallel to the plane.—G. H. G.

[6378.]—**Cantilever.**—If the ends of cantilevers were not fixed securely and the vertical strut was loosely connected, the effect would not be equal to a cantilever of double the strength; if the frame was rigidly fixed at A and C, little increased strength would be derived, as the timbers are in the worst position to take the strain. If C D was a raking strut, the effect would be considerably increased.—G.

[6379.]—**Papering New Walls.**—Rendering in Portland cement and sand, and a setting of Keene's cement is a good preparation for immediate papering, though if the walls are at all damp, or are exposed to a wet quarter, I should advise waiting a short time. There is a kind of tin-foil sold which can be fixed to the wall

before papering, and which prevents the damp coming through. Any respectable decorator would be able to supply it, and I think upon this there would be little risk of damp showing.—G. H. G.

[6379.]—**Papering New Walls.**—If "X. Y. Z." does the work carefully as he says, being particular to use clean sharp sand, free from saline or loamy matter, he cannot do better. The finishing coat may be either Keene's or Parian cement. Before papering, the surface should have a coat of paint prepared, as painters call it, "sharp colour."—Old Builder.

[6379.]—**Papering New Walls.**—I should not like to risk a *good* paper on new work, such as "X. Y. Z." suggests, and would advise him to adopt either boarding or canvas, or a process that was introduced to me some time since, by which the patentee promised to enable such work as "X. Y. Z." requires to be done. I should like to know if the process is working now, and where the same can be obtained. It was called, if I remember rightly, Atkinson's or Hitchings Rapid Slab Plastering. The slabs of plaster were sold dry, and were to be fixed with nails, over which paperhanging or colour could be put at once.—T. W. S.

STAINED GLASS.

Farnham.—A stained-glass window has been placed in the south aisle of Farnham parish church, in memory of the late Dr. J. S. Utterton, suffragan Bishop of Guildford. The window is of three lights. In the centre is the figure of Our Lord as the Shepherd and Bishop of Souls, and beneath it the Parable of the Talents. In the right-hand light is a figure of St. Barnabas, and underneath he is represented as laying the price of the land at the Apostles' feet. On the left light is St. Paul, and beneath it he is depicted as preaching at Athens. The work has been executed by Messrs. Powell and Sons, of Whitefriars, London.

Our Office Table.

At a general assembly of the Royal Academy held last Friday evening, Messrs John Brett, painter; Andrew Gow, painter; and William Burges, architect, were elected Associates of the Royal Academy. We especially congratulate the Royal Academy on the last-mentioned election; and we trust that at the earliest possible date, Mr. Burges may take his proper place among the Royal Academicians.

Prince Leopold presided last week at the first meeting of the Kyrle Society, which was held in the Kensington Town Hall. There was a large attendance, including the Princess Louise and Sir Frederick Leighton. Prince Leopold made an earnest appeal to all, in order that a love of beautiful things might be diffused among the poor. Amongst the objects of the Society were the preservation of open spaces, the laying out of open spaces as gardens for the public, the formation of choirs to give concerts to the poor, decorations by mural paintings, and the gifts of flowers. The objects of the Society were warmly approved.

Mr. James Miln, known to the literary and archæological world by his important work, published in 1877, entitled "Excavations at Carnac," died last week. In the summer of 1873, Mr. Miln went on a tour to Brittany. When visiting the celebrated alignments of standing stones around Carnac, his attention was drawn to a series of mounds at the Bossenno, which he determined to investigate. His operations extended over the next three years, and resulted in the discovery of a Gallo-Roman settlement, consisting of a villa of eleven rooms, surrounded by a number of other buildings, including a bath and a small temple, which seemed to have been occupied for a considerable period prior to the middle of the fourth century, when they had probably been destroyed by fire. The results of these investigations were embodied in the work already mentioned, which was issued almost simultaneously at Edinburgh and at Paris. Returning to Carnac in 1877 he continued his researches, and having at length finished the text and illustrations for the first of a series of new works in which he intended to embody the results of his last three years' excavations, he came to Edinburgh at Christmas to see it through the press. During the few intervening weeks he worked incessantly, and had completed the revision of the proof-sheets the day before he was seized with his short and fatal illness.

Considerable progress has been made with the arrangements for the London International Medical and Sanitary Exhibition, 1881, and since the publication of the first list of the Guarantee Fund, the following additions have been received:—Messrs. Burroughs, Welcome, and Co., £30; Robert Rawlinson, Esq., C.B., £25; Sir James Paget, Bart., F.R.S., £10 10s.; T. C. Smith, Esq. (Hull), £10, Messrs. Strode and Co., £10; Messrs. Woollams and Co., £5 5s.; John Carter, Esq., £5; Messrs Mayer and Meltzer, £5; W. A. Meredith, Esq., £5; The Sanitary Engineering Company, £5; Daniel T. Bostel, Esq. (Brighton), £3; William Martindale, Esq., £2; Albert E. Fraedelle, Esq., £1 1s.; and Messrs. Walter Macfarlane and Co., £25. In addition to the medical and sanitary sections there will be a miscellaneous section, consisting of school furniture and other articles more or less connected with the general purpose of the exhibition. Applications for space are to be sent in not later than Thursday, March 31st, 1881, but from India, the Colonies, and America, applications will be received up to April 15. Full particulars may be had on application to the secretary, Mr. Mark H. Judge, Parkes Museum of Hygiene, Gower-street.

On Wednesday evening, the 26th ult., a soirée was given by Messrs. Watt and Wilson, contractors for Lord Bute's new mansion, now in course of erection at Mount Stuart, Bute, to the men employed on the works. The company numbered about 200, and the chair was occupied by Mr. J. Windsor Stuart, factor for the Bute estate. The occasion was the opening of a recreation-hall, which has been built at Lord Bute's expense, for the workmen, who, situated as they are, about five miles from Rothesay, the nearest town, are in a somewhat isolated position, and such a hall will supply a much-felt want. At the close of the proceedings, amongst other votes of thanks, one was enthusiastically accorded to his lordship for his generosity in providing the new hall.

The sixth half-yearly report and balance sheet of the National Association of Master Builders of Great Britain have just been issued. It is reported that since the last meeting the National Association of Master Builders of Scotland and the Builders' Association of Weston-super-Mare have joined this Association, bringing the total number of affiliated societies up to 49. The council regret to find, from statements submitted to them, that there is still great depression in trade, with very little prospect of improvement, and in every town there is a much larger number of men seeking employment than is required. The only alterations in the working rules or rates of wages, which were pending when this report was issued, on the 23rd Jan., were the following: Birmingham—Notice has been received for advance of ¾d. per hour from the operative carpenters; and from bricklayers for ½d. per hour, together with an alteration in the rules. Bolton—The master builders gave 6 months' notice to masons that their wages would be reduced 1d. per hour from the 7th May next, and they have received a counter notice asking for an advance of ¾d.; this notice given by the employers to the operative masons is simply to reduce the wages to the same rate as that which is being paid in Manchester, which is only 10 miles distant. Manchester—Notice has been given by the employers to revise the plasterers' rules. With reference to clause 23 in the "Highways and Locomotive Amendment Act of 1878," whereby many contractors have been made liable for repairs to the road when the surveyor of the district has considered that they had extraordinary traffic thereon, the solicitor of the association has pointed out that a builder is not bound to pay whatever a surveyor may demand but has a right to refuse until the surveyor has proved, to the satisfaction of the court for the district, that the damage has been done, and the person alleged to have done the damage to the road by the extraordinary traffic may bring before the court evidence to the contrary if he thinks the amount unjustifiably high. The balance-sheet shows total receipts from all sources of £411 11s. 3d., and the balance in hand which in July was £329 8s. 10d., has been reduced to £187 9s.

The Bishop of Worcester presided over a meeting held on Tuesday in the Town-hall, Stratford-on-Avon, to consider what steps should be taken for the restoration and improvement of the parish-church, celebrated as the burial-place of Shakespeare. The Marquis of Hertford proposed "That, in the opinion of this meeting, the present condition of Stratford-on-Avon Church renders it desirable that steps should be taken to make it more worthy of the great purposes to which it is devoted." In the course of his remarks his lordship said, although he was pleased to take part in the proceedings, yet he felt compelled to enter his protest against the project being initiated at such an inopportune time as the present. However, there was no reason why a beginning should not be made now, although it was impossible to make much progress until times improved. His lordship, in conclusion, said if it was proposed to interfere with that beautiful spire, he, for one, would have nothing to do with the project. Mr. S. E. Shirley, of Eatington Park, seconded the resolution, stating that in the hands of the eminent architect who had been called in the work of restoration might be safely left. Mr. C. E. Flower (ex-mayor of Stratford) proposed, as an amendment, "That this meeting do now adjourn until this day three months, to enable the parishioners of Stratford to assemble in public meeting and discuss the present state of the parish church, form a representative committee, and report the result of their deliberation." Mr. E. Gibbs seconded the amendment, and referred at some length to the extensive and costly restoration effected 40 years ago. As an architect, and one who was concerned in the carrying out of the former work, he denied that the fabric was in need of attention. It had had spent upon it during the time named as much as £10,000. The mayor of Stratford (Alderman Cox) supported the amendment. The bishop then put the amendment to the meeting, when a very large number of hands were held up in its favour. On the contrary being put, only a few persons in the body of the hall voted for it, apart from the clergymen and others on the platform. His lordship declared the amendment carried by a very large majority. The meeting then became somewhat lively. An effort was then made, amid considerable excitement, to appoint a committee; but it was strongly opposed by the great majority of those present, and the meeting broke up in some disorder, the vicar expressing a determination to go on with the work.

Throat Irritation.—Soreness and dryness, tickling and irritation, inducing cough and affecting the voice. For these symptoms use Epps's Glycerine Jujubes. Glycerine, in these agreeable confections, being in proximity to the glands at the moment they are excited by the act of sucking, becomes actively healing. Sold only in boxes, 7½d. and 1s. 1½d., labelled "James Epps and Co., Homœopathic Chemists, London." A letter received: "Gentlemen,—It may, perhaps, interest you to know that, after an extended trial, I have found your glycerine Jujubes of considerable benefit (with or without medical treatment) in almost all forms of throat disease. They soften and clear the voice. In no case can they do any harm.—Yours faithfully, Gordon Holmes, L.R.C.P.E., Senior Physician to the Municipal Throat and Ear Infirmary."

Holloway's Pills.—These famous Pills purify the blood, and act most powerfully, yet soothingly, on the liver, stomach, kidneys, and bowels, giving tone, energy, and vigour to the whole system. They are wonderfully efficacious in all ailments incidental to females, and, as a general family medicine, are unequalled.

CHIPS.

On Wednesday evening, January 26, Mr. Richard J. Collier, of 28, Finsbury-pavement, offered for sale by auction, at the Chequers Inn, Marsh-street, the Black Horse Lane Estate. Notwithstanding the inclement weather, there was a fair attendance of buyers, and about three-fourths of the estate was soon disposed of, the sales amounting to £7,172, and as Mr. Collier has since sold several lots by private treaty, there is no doubt but that purchasers for the remaining portion will soon be found.

A special meeting of the Sanitary Committee of the Hull Corporation was held on Wednesday week, to receive a report from Mr. F. Sharp, borough engineer, on the interruption to the outward flow of the sewage. It was stated in the report that, owing to the increase of population, especially in the western district, the accumulation of backwater between tides was steadily increasing, and that it had become necessary, in order to prevent the generation of gases, to establish pumping engines; looking to the fact that the necessity for relief was even greater in Newington than in Hull, it was desirable to have one pumping-station for the two districts, the estimated first cost being £12,000. It was decided to forward the report to the local boards of the adjacent districts of Newington and Cottingham, in order to obtain their co-operation.

The Tewkesbury local board of health last week resolved to purchase the entire undertaking of the Tewkesbury Gas Company, at the price of £15,000, subject to the approval of the ratepayers, and the consent of the Local Government Board.

A clock, with a single black dial and gilt figures, and a peal of three bells chiming the hours and

quarters, have just been placed in the tower of Froxfield Church, near Petersfield. They were supplied by Mr. J. W. Benson, of Ludgate-hill, E.C.

Two new schools are in course of completion for the Swindon School Board, and will shortly be opened. Those in Sanford-street are being built by Messrs. Jones and Co., and the contractors for the Westcott-street schools are Messrs. Forse and Astley.

Mr. T. J. Elliott, resident agent of the Southwick Park Estate, Hants, has been appointed Professor of Estate Management at the Royal Agricultural College, Cirencester.

The officers of the Royal Engineers propose to erect a memorial stained-glass window in Rochester Cathedral in remembrance of their comrades who fell in the Zulu and Afghan wars.

Plans by Mr. W. St. John H. Hancock were submitted to the Bognor Local Board, last week, of an estate known as Brooklands, on which it is proposed to erect 300 dwelling-houses, and also summer and winter gardens, baths, a pier, &c.

A new post-office is about to be erected at Neath, South Wales, from designs by Messrs. Lean and Hooley, architects, of that town. It will be Modern Italian in style, and will be situate at the corner of Wind-street and Church-place; the street frontages will be of native polled stone, with Bridgend stone dressings.

The iron viaduct across the Solway, on the Solway Junction Railway, near Annan, was seriously damaged on Sunday by large masses of ice coming down from the Esk and the Eden. Many of the pillars have been broken, and further damage has since occurred. As the line is closed for traffic on Sundays, there was no accident. The bridge is a mile and a quarter in length, is constructed of pillars and girders, and was completed in 1867.

A special meeting in quarter-session of the Devonshire magistrates was held on Friday, to receive the report of a committee appointed to consider the manner in which the county surveyor had discharged his duties. The committee announced the reception of the resignation of the surveyor, and it was decided, before making a new appointment, to consider the duties of the office with regard to the advisability or otherwise of appointing two county surveyors instead of one.

The town council of Grimsby adopted, on the 19th ult., a scheme and plans prepared by the borough engineer for the main drainage of the town, and also of the adjacent urban sanitary district of Clee-with-Weelsley. The estimated cost of the scheme is £7,554 for the Grimsby portion, and £1,667 for the Clee portion.

The vestry of Kensington have raised the salaries of their surveyor, Mr. Weaver, from £600 to £700 per annum, and of their medical officer of health, Dr. T. Orme Dudfield, from £500 to £600.

A new mission church of St. Ambrose, was opened at Pendleton, near Manchester, on Sunday. It is Gothic in style, and is built of brick, with terra-cotta stringcourses and copings. It consists of chancel, nave, and south aisle, measures 70ft. by 28ft., and seats 380 persons. The principal roof is of pitch-pine, and is open to the collar-beam; the seats, chancel-screen, and other fittings are also of pitch-pine. Mr. Henry Lord, of Manchester, is the architect.

A fire occurred on Saturday morning on the premises of Messrs. Weaver and Green, builders, of New Wharf-road, Caledonian-road, N., and resulted in the destruction of the upper portion of a building 40ft. by 20ft. used as workshops.

The parish-church of St. Michael, Highgate, was reopened on Saturday, after undergoing enlargement, reseating, and improvements in ventilation and warming, at a cost of £3,000.

An inquiry was held at Bolton, before Mr. Arnold Taylor, one of the inspectors of the Local Government Board, on Friday, into an application from the town-council for sanction to borrow £300,000 for street improvements and works of sewerage. Mr. J. Proctor, borough surveyor, explained the details of the works, some of which have already been partially carried out.

A chancel-screen has just been erected in the parish-church of Norton-sub-Hamdon. It is of wrought iron, on stone base, and stands 13ft. high; it is gilded in parts, and painted maroon and black. Mr. A. W. Blomfield, M.A., of London, designed the screen, which was carried out under his superintendence by Messrs. Shrivell and Co., of London. Messrs. Stansell, of Taunton, executed the decorations.

Mr. John Stones, of Ulverston, has fitted up the new banking premises at Stamford for the Northamptonshire Banking Co., described in our issue of 21st ult., with his curvilinear iron revolving shutters, worked by patent balance-weight motion.

The Royal Archæological Institute have been invited by the Mayor and Corporation of Bedford to make that town the centre for the present year's annual excursion.

The members of the architectural classes in the Brighton school of art, numbering about 45, paid, on Saturday afternoon, the first of a series of visits to building-works in progress; visiting, under the direction of the head-master, Mr. W. M. Alderton, the new children's hospital in Dyke-road. At the close, a vote of thanks was passed to Mr. Potter, the clerk of the works, who had explained the works.

The bridge trustees of Glasgow have received a report from Messrs. Bell and Miller, engineers, as to the condition of Glasgow-bridge. It is therein stated that every arch of the bridge is fractured, and that the fissures extend for 223ft. out of the 389ft. total span. These fractures, which extend along the centre line of the bridge, have been caused by the passage of weights much heavier than the bridge was originally intended in 1835 to bear; and further injury had been caused by the lowering of the river-bed. They recommended that no weights over 12 tons be allowed to cross the bridge, and that the footings and foundations be protected by throwing down bags of Portland cement concrete.

The lecture-hall connected with the Congregational chapel at Cliftonville, West Brighton, is about to be improved by the addition of a number of new class-rooms. These will form a new front to the street and will be built in Kentish rag to agree with the chapel. The plans are being prepared by Messrs. Holford, Clayton, and Black, architects, of Brighton.

BEVIS'S BUILDERS' BOOKKEEPING

On an IMPROVED SYSTEM. Price 3s., post free.

"Has been adopted with excellent results."—*Builder.*

"A concise, simple, and accurate guide."—BUILDING NEWS.

BEVIS & CO., 8, St. Martin's-place, Charing-cross, London.

EVERY ARCHITECT'S, SURVEYOR'S, AND BUILDER'S OFFICE should contain a set of

MR. BANISTER FLETCHER'S VALUABLE TEXTBOOKS, arranged in Tabulated form, and fully indexed for ready reference.

QUANTITIES, the most complete, concise, and handy work on the subject, copiously illustrated, 3rd Edition, with additional chapters on Cubing, Priced Schedules, Forms of Fair Bills, and the Law relating to Quantities. Crown 8vo., 6s.; post-free.

DILAPIDATIONS, with Schedules of Trades, &c. 2nd Edition, crown 8vo., cloth, 5s., post-free.

LIGHT and AIR, with methods of Estimating Injuries, Reports of Most Recent Cases, &c. Twelve diagrams, crown 8vo., cloth, 6s., post-free.

COMPENSATIONS, with Appendix, giving Forms of Precedents, and Valuation Tables; crown 8vo., 5s., post-free.

ARBITRATIONS, Crown 8vo., cloth, 5s. post-free.

The set of five vols., in cloth-covered box, price 28s., carriage paid.

Also.

MODEL HOUSES for the Industrial Classes, 2nd Edition, with additions; 13 plates, 8vo., cloth, 6s., post free.

N.B.—These works cannot be obtained at Mr. Fletcher's Offices, but should be ordered direct from the publisher,

B. T. BATSFORD, 52, High Holborn, London, or of any Bookseller.

"EPITOME of PATENT LAW and Information as to the Registration of Designs and Trade Marks," by H. H. Banyard, Solicitor and Patent Agent, gratis to Inventors on application, or post free. Patents obtained at most moderate charges. Infringements investigated and opinions given. The sale of Patents negotiated. Provisional protection, £3 8s.—41, St. Andrew's Hill, Doctor's Commons, London.

Drake's Mosaics.

MOSAIC STONE,
MOSAIC MARBLE,
MOSAIC GRANITE.

Superior Strength, Durability, and Beauty.

For Exterior and Interior Decorative Construction.

COLUMNS, PILASTERS, CORNICES, COPINGS.
DOOR AND WINDOW DRESSINGS. PANELS.
DADOS, CHIMNEYPIECES, FENDERS,
HEARTHS, FLOOR TILES, WALL TILES,
PAVEMENTS, FIREPROOF STAIRCASES, & DOORS

Drake's Fireproof Construction.

Drake's Concrete Building Slabs;

Drake's Granite Concrete Pavements;

AND

Drake's Concrete Building Apparatus.

SEE ADVERTISEMENTS IN ALTERNATE WEEKS.

FOR SAMPLES AND PARTICULARS, APPLY TO

CHARLES DRAKE & CO. (LIMITED),

Railway Wharf, Battersea Park, London, S.W.

WANTED, PREMISES (dilapidated or otherwise, covered or open) to RENT or PURCHASE, within about half-a-mile of St. Martin's-lane, W.C., to be used as Store Premises for Material, &c.—Address, A. B., 137, Strand.

WANTED.

ADVERTISER requires Situation as Junior Assistant; four years' experience. Working Detail and Perspective Drawing, Draft Specifications, Measuring, and General Routine.—Address, W. H. C., 2, Avenue-place, Tuddenham-road, Ipswich.

BRICKMAKERS and Others.—Advertiser, with 20 years' experience in making Kiln and Clump Bricks, Pipes, Tiles, &c., seeks Situation as Foreman or Manager; ten years' reference to last employer.—Address, BRICKMAKER, "Surrey Advertiser" Office, Guildford.

TO BUILDERS, PLUMBERS, GLAZIERS, &c.—A good Three-Branch Hand wants Employment, Lead Glazier and Quick Paperhanger; good references.—Y. Z., 15, London-road, South Lowestoft.

A YOUNG MAN desires Employment in an Architect's Office as Improver; good reference; small salary required.—Address, A., 4, Croft-terrace, Dunstan's-road, Peckham Rye.

AGE 19.—Architect and Surveyor's Assistant, with Practical Experience in preparing Plans and Measuring Work, seeks Engagement; 3 years with present employer; satisfactory references.—Address, B. POTTER, 50, Chetwynd-road, Dartmouth Park-hill, N.W.

DRAUGHTSMAN (Architectural) requires a Re-engagement in London; competent in Perspective, Competition, Working and Detail Drawings, General Routine; 9 years' good experience (Gothic and Domestic); good correspondent; specimens.—B., 18, Offord-road, Barnsbury.

AN EXPERIENCED CLERK OF WORKS is open to an ENGAGEMENT either in Church or Domestic Work; the former preferred; can have first-class testimonials both as to ability and character.—Apply, H. L., 41, Bullingdon-road, Oxford.

AN ARCHITECT, who has made Ornament and Colour Decoration a special study in Paris and New York, desires an ENGAGEMENT with a firm of Decorators with view to partnership.—Address, L, E. HICKMOTT, Marden House, Rotherham.

ARCHITECT and SURVEYOR'S ASSISTANT desires RE-ENGAGEMENT; has excellent references and 7 years' experience.—Further particulars on application to HERBERT, 4, Englefield-road, Essex-road, N.

PRACTICE.—Advertiser wishes to meet with Architect and Surveyor to join him in taking over practice of his present employer; £250 to £300 necessary; suitable for one accustomed to a Borough Surveyor's Office.—Address, J. C. 12, at C. H. May and Co.'s General Advertising Offices, 78 Gracechurch-street, London.

CARVERS.—WANTED, Several good WOOD CARVERS; also one or two STONE CARVERS.—HARRY HEMS, Ecclesiastical Art Works, Exeter.

DECORATOR'S BUSINESS to be SOLD, through illness.—Valuable LEASE of HOUSE, SHOP, &c., or the Shop and Business would be let separately.—Apply to R., 33, Calverley-road, Tunbridge Wells.

ASSISTANT (Architect & Surveyor's), thoroughly competent, requires ENGAGEMENT (London) temporary or otherwise; would undertake work at own rooms; references.—M., 20, Red Lion-square, W.C.

TO ARCHITECTS.—WANTED.—EVENING EMPLOYMENT, either at home or by appointment. Designs prepared from rough sketches, perspectives, tracings, &c.—Address, X. Z., 16, Fremont-street, S. Hackney.

ASSISTANT (Architect and Surveyor's General), desires RE-ENGAGEMENT at the end of this month, when his present engagement terminates; Working Drawings, Details, Quantities, Superintendence, Measuring-up, &c., or would not object to act as Clerk of Works; country preferred.—ARCHITECT, 39, Market-place, Leicester.

WANTED, SITUATION in London Office as Junior Assistant; neat and expeditious Draughtsman; good references.—Address, F. W. S., 10, Belmont-road, Clapham, S.W.

CLERK OF WORKS.—Wanted, a thoroughly Competent Clerk of Works, to superintend the Erection of Dwelling-houses and Shops in London.—Apply by letter only, stating experience, references, and terms, to SURVEYOR, "Morning Advertiser" Office, 127, Fleet-street, E.C.

A LONDON ARCHITECT, with an established and increasing practice, wishes to meet with a PARTNER; a moderate premium required.—Particulars on application to C. C. 27, care of Messrs. Deacon, 154, Leadenhall-street, E.C.

PARTNERSHIP.—ARTISTIC METAL-WORKING BUSINESS.—WANTED, an energetic PARTNER with about £2,000 at his disposal to join a gentleman whose business has been established for 30 years in Manchester, and who is practically associated with the most eminent architects and contractors. The business connection is capable of very great enlargement. The incoming partner will be required chiefly to superintend the office and outdoor clerk's department; the highest references can be given, and will be expected.—Address, J. R. C., care of S. Beaumont, Esq., Solicitor, 26, Booth-street, Manchester.

WANTED, in a Public Office, a Junior Building Clerk, who must have been articled to an Architect or Surveyor, possess some ability in drawing and quantity surveying, and be willing, if required, to assist in other work where accuracy in figures and good writing are important. Scale of Salary, £80 to £200, by yearly increments of £10; first year on probation.—Applications, with testimonials (not to exceed three in number), or with personal reference, to be addressed to A. B., care of Messrs. Miller, 225, Westminster Bridge-road, S.E.

WANTED.—A PARTNER with £750, to take a Share in a Patent connected with the Building; splendid contracts in hand.—"AIX," 29, St. Stephen's-road, W.

POCKET SEXTANTS, £1 15s. 0d.; Prismatic Compasses, 18s. 6d.; Abney Level, £1 5s. 0d.; Cases of Instruments, £1 8s. 6d., including cases, are all made by Elliott Bros., Strand, and in perfect adjustment; same as used at the Royal Military Academy. Forwarded carriage free on receipt of P.O.O. Money returned if not approved.—T. F. HIRTS and SONS, Opticians and Jewellers, near Royal Arsenal, Woolwich.

THE BUILDING NEWS.

LONDON, FRIDAY, FEBRUARY 11, 1881.

COHESION.

IF we compare the principles on which ancient buildings have been constructed with those adopted in modern architecture, we find that in the former the resistance of the material to crushing was alone considered by the builders, while in the latter the cohesive strength or resistance to tearing asunder, has been brought into action as well as the crushing strength. Now since it happens that the power of resistance to crushing in stone or marble is always vastly superior to its cohesive strength, we find that many of the most ancient buildings, in which the former principle of construction has been adopted have stood until the present day, while works comparatively modern, in which the latter principle has predominated, and which from the nature of their construction have contained within them the elements of their own dissolution, are now often in a state bordering on ruin, and unless care is taken to preserve them will soon fall to pieces of their own accord. In the most ancient buildings, it was customary to use large blocks of carefully squared stone, which required little or no cementing material to keep them together, their own of weight sufficing to do so, and the strength the supporting columns or piers was always greatly in excess of what would suffice to carry the superincumbent loads.

With the introduction of the arch great changes took place in the modes of construction, small stones being employed instead of large ones, and cement between the beds and joints being relied on for keeping the stones in their places, and preserving the unity of the structure. And since the arch, from its very nature, is always trying to break itself up into its component parts, and doing its utmost to thrust out the walls of the buildings, it follows that the force of cohesion between the materials, by which the main parts of it are united together into one homogeneous mass, becomes an important matter for an architect's consideration.

When an arch breaks up it does so by the opening of the joints of its voussoirs, generally at three or four different points, and the force which causes this must be a tensile one, acting as it does against the cohesion of the material of which the arch is formed. Also when a wall is pushed over by the thrust of an arch or by any other force, it is the cohesion of the material that first yields to the strain, and the mass itself not being of sufficient weight to counteract the thrust by its own inertia, is overturned about its outer edge.

Cohesion may be defined as the attraction which all solid particles have for one another in accordance with the law of universal gravitation, by which every particle attracts every other particle in creation in direct proportion to its mass, and inversely as the square of the distance apart. A simple experiment will show the existence of this law, for if a small piece of wood is floated in the middle of a bowl of water, it will be found in a short time to have been attracted to the side of the vessel, and as often as we remove it therefrom, it will return to the side again. The cohesion between bodies which are brought in close contact with each other, increases in intensity also according to the time that they are left together undisturbed. Thus if two pieces of polished plate-glass perfectly clean are placed closely together, they will in a short time become so firmly attached as to render it a matter of some difficulty to separate them, and if left for a long period together undisturbed, it will be found easier to break the glass itself than to separate the two pieces at the joined surfaces, In this case, owing to the smoothness of the surfaces in contact, air is excluded, and the particles brought into the closest union.

In the construction of buildings, the materials used are always more or less rough on the surfaces to be united, and therefore will not unite of themselves, but require a cementing material to be interposed, which while attaching itself firmly to each surface, will itself possess as great cohesive strength as the materials it unites. In these cements it is found that time is an important element in the cohesive power which they attain; the cohesion of the cement when first used is generally but slight; but after a few days have elapsed, it is found that a considerable amount of force is necessary to separate the materials cemented together, and after some months have passed, it will often be found that the force necessary to break the cement will tear asunder the stone, brick or other material which it adheres to. Take, for example, the use of Portland cement for uniting two bricks together; if a cement of good quality and weighing 1cwt. or more per bushel is used "neat," to form the joint and kept under water for a month, it will require a force of 300lb. per square inch of surface to break the joint; if left for three months a force of 400lb. will be necessary; and if left for twelve months or more about 500lb. to 600lb. per square inch, will be required to tear asunder the cement. Now as the cohesive strength of ordinary brick is not generally more than 300lb. per inch, we see that the strain that would fracture the cement joint would be more than enough to tear asunder the bricks themselves. It is usual, therefore, to mix a considerable proportion of sand with Portland cement when employing it as a mortar, by which process its cohesion is very much diminished; thus the same cement as that mentioned above, when mixed with four times its bulk of sand is found to have a cohesive strength, after one month's immersion, of only 32lb. per square inch; after six months the strength is increased to 122lb.; and to 140lb. at the end of twelve months. If mixed with only twice its bulk of sand the cohesive strength at end of one month is 92lb. per inch, after six months it is 220lb., and at the end of twelve months the strength is 270lb., which is nearly equal to that of common brick itself, so that no great advantage is gained by using neat cement for ordinary brickwork, while an additional expense is incurred.

Cohesive strength may be considered as the diametrically opposite of crushing strength, which is the resistance of materials to the pressing more closely together of their particles, and in such materials as cement, stone, or brick is vastly greater than the cohesive strength or the power of resistance to the tearing asunder of the particles. Thus Portland cement which has been mixed with water and left to harden for a year or more, has a crushing strength of about three tons per square inch of section, while the cohesive strength is about 1-12th of this. In ordinary bricks also the resistance to crushing is five or six times the cohesive strength. In stone the force of cohesion between the particles is very variable, and but few experiments have been made to ascertain its amount with accuracy; but we find that Chilmark stone, whose resistance to crushing is 6,300lb. per inch, has a cohesive strength of only 500lb., while Craigleith stone, whose crushing strength is 7,800lb., can be torn asunder by a tensile force of only 450lb. per inch.

Slate is the only material that can be classed among stones in which the cohesive force is about equal to its crushing strength, being as much as from 9,000 to 12,000lb. per square inch of section.

The force of cohesion in mortar made with ordinary lime and sand varies so much according to the quality of the lime, that but little reliance can be placed on experiments with it; but there is no doubt that time is an important element in augmenting its cohesive power. The quantity of sand mixed with the lime also makes a considerable difference to the strength of the mortar; thus white chalk lime will not bear more than 3 times its bulk of sand, but if rendered "selenitic" by the addition of plaster of Paris, its greatest cohesive strength is attained with 5 times its bulk of sand; and the Burham lime, when rendered selenitic, has its maximum cohesion with 6 parts of sand; while Halkin lime made selenitic attains its greatest cohesive strength with only 4 parts of sand to one of lime. Roman cement, which is nearly as strong as Portland when used neat, is very much weakened by the admixture of sand, having little more cohesive strength than common mortar; its cohesion is, however, increased by time much in the same proportion as Portland cement.

Cements which are mixed with water in order to render them cohesive appear to require a certain amount of porosity in the materials to which they are applied in order to enable them to adhere to the surfaces, by which the water is partly absorbed before the cement is set, and the cementitious material becomes, to some extent, amalgamated with the stone or brick; such impervious materials as granite, slate, and flint having but little cohesion with ordinary cements; in the case of flint walling a certain amount of cohesion is obtained by using the mortar while it is hot, or before the lime in slaking has had time to cool.

In metals the cohesion of the particles depends very much on the process of their manufacture from the ore and the manner of treatment to which they are subjected. Thus if iron is melted and cast in a mould the particles arrange themselves in the form of crystals of a cubical or octahedral form, and the tensile or cohesive strength is small as compared with the power of resistance to crushing, the two forces being in the ratio of 1 to 5 or 6; that is to say, while the cohesion of cast iron varies from 6 to 10 tons, its crushing strength is from 30 to 50 tons per square inch of section. A considerable difference in cohesive strength is also found to exist between specimens of the same kind of iron when cooled rapidly or allowed a long time in cooling. When the proportion of carbon mixed with the iron is considerable, the cohesion is weak, but if subjected to a process which burns out a large portion of the carbon, it may be rendered tough and malleable, and its cohesive strength greatly increased. The material known as wrought iron has had the greater part of the carbon removed, so that the proportion is less than one per cent. of the mass, by the process of burning and then rolling or hammering, so that the crystals become lengthened out into fibres, which gives the iron immense cohesive strength, although it, at the same time, reduces its resistance to crushing by about one half. The form of section into which the metal is rolled or hammered considerably affects the cohesion; thus when made into round or square bars it will bear a strain of from 23 to 27 tons per square inch before being torn asunder; if, in the form of flat bars, the breaking strain will be from 22 to 26 tons, angle and tee iron will stand a strain of from 21 to 25 tons, while plates, if strained lengthways of the grain, are torn asunder with from 20 to 24 tons; but if the force is applied across the grain they will yield with a strain of from 17 to 21 tons. The resistance to crushing in short pieces of wrought iron is from 16 to 20 tons.

Another variety of iron in which rather more carbon is mixed with the metal than is the case with wrought iron, is termed steel, under which name, however, we find materials with great variety of cohesive power according to the mode of manufacture; thus ordinary soft steel has its cohesive and crushing strengths nearly equal, and amounting to from 30 to 32 tons per square inch; but in hardened steel the tensile strength is much greater, being generally about double that of wrought iron, and in some cases even much more than this. There is also a peculiarity about steel which gives it a great advantage as a building material over either wrought or cast iron—namely, that whereas the latter will have their elasticity permanently injured if strained with more than one-third or one-fourth of the breaking weight, steel bars or beams may be subjected to a load equal to one-half the breaking strain without their elasticity being injured in any serious degree, a property which renders it much safer to use than common iron.

Various experiments have been tried in order to ascertain the cohesion of the fibres of different kinds of wood; but so great a discrepancy is exhibited in the results obtained, that it is almost impossible to know beforehand how much force may be applied without producing fracture. Much depends, even in the same piece of wood, upon the amount of moisture it contains, the cohesive strength of wet timber being found to be about half that of dry timber; but, on the other hand, if the wood is over-dried its strength is materially diminished. From the experiments that have been made at different times, we find that the force necessary to tear asunder pieces of wood strained lengthways of the grain in tons per square inch of section is somewhat as follows:—Beech, 2·1 to 6·6; chestnut, 4·5 to 5·8; English elm, 2·4 to 6·3; spruce fir, 1·3 to 4·5; Dantzic fir, 1·4 to 4·5; American red pine, 1·2 to 6·0; American yellow pine, 0·9; Memel fir, 4·2 to 4·9; pitch-pine, 2·1 to 4·4; Riga fir, 1·8 to 5·5; English oak, 3·4 to 8·8; teak, 1·5 to 6·7. The resistance of timber to crushing is generally much less than its cohesive strength, being in some kinds of wood in the proportion of about 1 to 2, and in others of 2 to 3, when short pieces, such as cubes of wood, are experimented upon; it is therefore advisable to employ timber in a building in such a manner that its power of resistance to tensile strain may be brought into play rather than its crushing strength.

A knowledge of the cohesive strength of various building materials will enable the architect to arrange his design so as to get the greatest amount of work out of each kind of material he employs. Thus, since stone and brick have but small cohesive power, they will be best employed in such a manner as to put but little tensile or tearing strain upon them, while their great crushing strength is thoroughly utilised. Timber and wrought iron will be employed where great tensile force comes into action, and cast iron where a great crushing weight has to be sustained. Slate and steel, in each of which the tensile strength is more nearly equal to the resistance to crushing, may be employed in any way that appears convenient, the latter especially where a great load or strain has to be sustained, without risk to the structure.

CROWDING IN THE SUBURBS.

ANYONE who has watched the growth of our suburbs will have noticed two considerable evils which have sprung up from the encroachment of new buildings, and which promise before very long to make residence in the suburbs as disagreeable and as insufferable as it is in the denser parts, unless restrictive measures be carried out. The first evil to which we allude is the alarming intrusion of small houses upon the larger properties, the absorption in fact of every available acre or open space of ground by the speculative builder, and the destruction of once-beautiful gardens and open fields. The danger threatens to become yearly so formidable as to drive the wealthier and professional class of residents farther out, and to make our suburbs huge wastes of brick and mortar devoted to small trades and lodging-houses. But the danger does not stop here, for encroachment means encroachment on the rights of common and recreation for the people, and the diminution of the breathing area, or that degree of density of population which increases the Registrar-General's return as an inevitable and proportionate result. It means even more than this: the deprivation of light and air, and the exhilarative effects of open fields upon our children, the depressing influences of crowding, and, to the poorer classes, degradation, dirt, and misery. This state of things has been brought forcibly to our minds from what has been recently going on in the south and west of London, and the repeated grievances made known in the newspapers published more particularly in those parts, which seldom find expression in the greater and more central journals of metropolitan opinion. To take a sample of a few of these. One writes under the incognito of "Fresh Air," complaining "loudly against the nuisance of the brick-fields and dust heaps" in one locality of Brixton, the vapours and smells from which are sickening, and extremely distressing to dwellers in that large and overgrown part of London. Windows to parlours and bedrooms are obliged to be closed during the larger part of the day, and as the warmer weather comes, the nuisance is not only insufferable, but positively injurious to health. Another equally strong letter in the *South London Press*, under the heading of "Open Space," dwells at some length upon a greater nuisance, as he calls it. He says: "What I complain of is this: Large houses, with their beautiful gardens, are destroyed to build small property, or, perhaps, to make six houses out of one," and he cites the neighbourhoods of Stockwell and Herne Hill, where one dense mass of small houses exists, with narrow roads, and not one open space or public garden to be met with. And he appeals to our municipal rulers and vestries to check this reduction of open ground, and concludes by calling to mind the regulation of public buildings abroad, in such cities as Paris, Vienna, Turin, &c., with their fine wide roads and public gardens. A third and larger class of residents, who are obliged to dwell in localities under the control of the vestries, repeatedly protest against the unjust incidence of rating, in having to pay for roads that have never been properly made, or the substratum of which is wholly composed of rubbish and dust-heaps. Well may some exclaim, their own dust-heaps are brought from the back to the front of their houses. These are only a few of the complaints made which will be found to make up the staple of correspondence in the columns of suburban newspapers, and which are constantly repeated from one year's end to the other.

There is an artistic, as well as sanitary and moral, aspect to this question of encroachment which it would be injudicious to ignore, and it appears to us to be the duty of the architectural press to call attention to the unrestricted manner in which our building-estates are managed, and the pernicious nature of what, in a few years, threatens to become a great blot upon our architectural achievements and civilisation.

One of the principal causes which have contributed to the evil is the springing-up of new localities near the lines of our local railway systems, and the temptations offered to owners of land and the larger class of property to sell or part with their interests. The conditions of short leasehold tenures have also operated to favour the overcrowding of estates, and to take away the inducement to lay out capital on buildings of an architectural character. Plots of land are granted without restrictions, no plan of boundaries or the number of dwellings to be erected is laid down, and the consequence is the building of a small class of house, with cramped gardens — if they can be dignified by that name — overlooking the grounds of larger residences. There is no legal redress for the occupiers of these, who have to bear all the inconveniences attending a row of small tenements whose windows, back or front, overlook their grounds, depriving them of prospect, light and air, or otherwise destroying the residential quiet or pleasantness of the locality. The Land Clauses Consolidation and Amendment Acts, it is true, afford protection to owners and occupiers of property in the event of companies or projectors of railways and other works having power to take certain lands and buildings. The clauses in those Acts provide for compensation for compulsory sale, also for deprivation of rights and goodwill, deterioration caused by severance of land injuriously, lessening light and air, nuisances, &c.; but they do not touch that larger class of injuries inflicted upon estates by jerry builders, by the close edging round of small tenements, and there is no legal responsibility for injury or inconvenience caused by the speculative builder who chooses to obstruct the prospect from your windows, and seldom can compensation be obtained for diminution of access or frontage from these causes. The Lands Clauses Consolidation Act enables the owner to claim compensation, not only for land purchased, but also for damage caused by severing the land taken from other land, and the owner may compel promoters under certain circumstances to take that land, which severed would be of no value to him; but there is no statute which protects the occupier of a decent house or piece of land from the injury or nuisance of having his garden-front spoilt by the erection of a lot of back yards and pig-sties. It is true an injunction in equity may be obtained for *permanent* nuisances, such as swine-pens, lime-kilns, brick-kilns, offensive gases, smoke; and the Nuisances Removal Acts apply generally; but there are numerous pleas upon which they can be evaded, and the aversion people have to go to law or to indict for such offences make these legal processes almost dead letters. No occupier can resent the raising of a wall to interrupt prospect, for the law holds it to be only a deprivation of delight, not of what is absolutely necessary; nor is it considered a legal nuisance to destroy the privacy of another by opening windows directly overlooking his house or grounds. In cases of building close to another's property the only legal remedy is for obstruction of light and air; but this obstruction seldom amounts to the deprivation necessary to sustain an action in the circumstances we are considering. The obscuration must amount to a real inconvenience. So far, then, the occupiers of the better class of houses must submit or vacate them; they have no remedy against the encroachments of a greedy set of builders who, whenever they have the chance, pounce down upon some semi-rural locality within moderate distance of rail, take a lease of land, uproot all the fine trees, intersect it with numerous roads, and cover every available foot with buildings. The open sites are thus spoilt by constant invasions of the overwhelming tide of bricks and mortar, the few properties that remain untouched like islands of green park

or meadow, quickly fall in market value as "desirable" residences, and, in their turn, are swallowed up by the untiring demand for small houses. We only refer the reader to the transformations going on at Brixton, where some of the best and most open neighbourhoods are being divested of all their character and pleasantness by rows of mean tenements, the backs of which face the gardens of the better houses, and by what has been done at Streatham, the Dulwich-grove Estate, Peckham Rye, Wandsworth, and other parts. One writer fairly complains of the want of discrimination in the selection of sites for these mushroom dwellings, and that builders should be allowed to erect their wretched tenements over open spaces like Stockwell-green, in defiance of the public sense and in utter disregard of the rule that houses in the suburbs should have gardens attached to them. Our builders have, in their desire to produce rent, neglected to make their houses in size and character correspond with the locality, and as long as the public tolerate this state of things, it will be useless to look for architectural and sanitary improvements in dwellings of this class.

The invasion of residential estates and open spaces felt in the suburbs is made more palpable, from another no less crying evil which the Building Act of the Metropolis fails to remove. There is a complaint from many residents that no gardens are given to the houses on many new estates. Not content with hustling together several hundred houses on an acre or so of land with open gardens in contiguity, no provision has been made for even proper airing ground, and the tenants are compelled to endure the vexation of not only having to live out of town, but to enjoy none of the conveniences of a rural suburb when they get there. It is, besides, a cruel irony which brings people within sight of open fields and gardens, but denies to them a share in them. We believe it to be the duty of those who administer our local Building Acts to exercise some discretion in these matters, and, if necessary, to enforce restrictions upon builders by curtailing the means they possess of invading the rights of the occupiers of old estates, and by laying down a limitation of the number of plots of land for houses in suburban localities. It is hardly necessary to ask Legislature for greater powers than are at present possessed under our Building, Metropolitan Management and other Acts. All that is demanded is the exercise of discretionary powers and a little more restriction upon those who cover estates, a more careful supervision of the building in our suburbs carried on by irresponsible persons, or as much as is bestowed upon architects' work in the metropolis.

THE WATER QUESTION.—I.

THERE are several great questions before the public at the present time, some political and others not so. Of politics we have nothing to say here; but the water question is one which may be treated impartially, and the scope is certainly large enough. Most people are affected by the water question; some have too much, some too little, and others are supplied with water of bad quality, while some have no supply at all. The water question has many branches; those to be treated of here, in a general sort of way, are the prevention of floods, the supply of water for domestic and other purposes, the maintenance of navigations, the damming up of water for mill purposes, the levels of the outfalls of land-drainage, and the purity of river water equal, at least, to the preservation of fish. In considering any one of these, regard must be had to all the others. The management of rivers in England and Wales is at present under too many separate and independent authorities, whose interests are antagonistic to each other, and it seems impossible to allow the present state of things to continue much longer. All the water interests of each river basin should be under the control of one authority, composed of representatives of the various interests within the watershed area or river basin; indeed, two Bills have already been introduced in Parliament this session, the one in the House of Commons by the members representing Bedford, London, St. Ives, Stockton, and Herefordshire, "to make provision for the better prevention of floods, and for the conservancy of rivers," and the others in the House of Lords by the Lord President of the Privy Council "to make provision for the conservancy of rivers, prevention of floods, and other matters." Although the two Bills are alike in intention, they differ in their scope and provisions. The House of Commons Bill proposes to make the unit of area to be represented three parishes or one borough, which is to be a "sub-district," and the "district" is to consist of all the unions of parishes—the Poor-Law Unions—in any county; and the general district is to be the whole basin of a river having its outlet at the sea. In view of these provisions, it may be well to see what the number of parishes is in each county. They are, approximately, as follow. It must be premised that they include those parishes which are within boroughs. The order in which they are set down follows first, the South coast, then the East coast, the North-east, the North-west, and the West. Anything coming within the scope of the water question must be considered without distinction of boundaries between England and Wales, and, therefore, in following the Western coast, the order is not here broken by any such distinction. Taking the line of hills which range north and south through England, much more rain falls in the counties on the Western side of the range than in the Eastern or Midland counties; but as we are not now offering any comparison in this respect, it seems more fitting to take them in the order set down, viz.:—

Counties.	Number of Parishes.	Number of Unions.

	14,861	647

In any consideration which may be given to the subject for the purpose of which these approximate numbers of parishes in England and Wales are given, it is better to exclude the metropolis altogether. Thus, deducting 191 parishes from the total number of 14,861 there remains for England and Wales, except the metropolis, 14,670 parishes, including those which are within the boroughs, and deducting for the metropolis, in like manner, 22 unions, there remain of them 625 in the 54 counties of England and Wales. The authors of the Bill may be able to show some good reason for limiting the extent of a sub-district to three parishes, but the number certainly appears to be very small. The extent of a "district" seems better, being practically co-extensive with the county; and as to the area to be dealt with by the General Conservancy Board, viz., the whole river basin, that has almost unanimous consent.

The Bill provides that in any "sub-district" the owners of property of the annual ratable value of £300 in the aggregate, may apply to the Local Government Board for a provisional order to put the Act in force, or a town-council may do the same: and owners of property of the aggregate annual value of £1,000 in any county, may apply for the constitution of all the unions into a "district," which would be, generally, co-extensive with the county, or thereabouts; or two boards of guardians, or one town-council, may do the same; and for the establishment of the "General Conservancy Board," having jurisdiction over the whole river basin, two town-councils, or the owners of property of the annual ratable value of £2,000 in the aggregate, may apply in like manner. The duties of a sub-district and of a district conservancy board would be to protect the river and watercourses, and to prevent or mitigate floods, by removing *débris* from their beds, and repairing and maintaining their banks; and a district conservancy board may, further, widen, straighten, or otherwise improve any watercourse, or remove any existing bank, wall, dam, or weir, or make any new one, or make any new watercourse or sluice; but these works are to be subject to the approval of the General Conservancy Board, and where the water-level may be lowered by the removal or alteration of any dam or weir, compensation for injury thereby is to be made. The General Conservancy Board is to be composed of representative members of

the district boards, members of town councils within the river basin, justices of the peace, owners of property rated at £100 a year and upwards, and members of any existing conservancy body within the area; so that the system is throughout largely representative of the ratepayers. The fund out of which the expenses are to be paid is to be raised by a rate upon lands as defined by the local government board, and which is to be levied on the same basis and subject to the same rules as the poor rate. This is to constitute a general conservancy fund, but a district board or a sub-district board may raise a fund solely within their district by a separate rate, for the purpose of carrying out any work solely within their district; but the General Conservancy Board are to have a veto upon this if they are of opinion that any such proposed work would be injurious to the general interests of the area of their jurisdiction.

Former Acts of Parliament have failed of their purpose in the matter of rating the lands proportionately to the benefits received. In this Bill it is proposed, under the head of "Special benefit of particular lands," to charge such lands as the Conservancy Board may declare to be particularly benefited by works carried out by them, with special expenses, as private improvements, the fund for which is to be raised by a private improvement rate in the same manner as such rates are raised under the Public Health Act, 1875. The Conservancy Board may, with the approval of the Local Government Board, borrow the money required for the purposes of the Act from the Public Works Loan Commissioners, for a term of years not exceeding fifty. The occupiers are to pay the rates and deduct them from the rent next due. These are the chief features of the Bill introduced in the House of Commons. In defining the area over which a General Conservacy Board is to have jurisdiction as "the basin of any river having its outlet at the sea," there appears to be a defect. It may, perhaps, be amended when the Bill comes before the committee; but as it stands, in that respect, several large and important rivers which ought to have separate conservancy boards, would be included with others which are large enough without them; thus the Wye, which has a watershed area of 1,609 square miles, would be included with the Severn, and the Trent and the Yorkshire Ouse would both be included in the basin of the Humber, whereas the Trent and the Ouse ought certainly to have separate conservancy boards; the one is 4,052 square miles in extent, and the other 1,842 square miles, and they enter the Humber from opposite directions; and there are other similar cases. Then, as the Bill stands, each little river all round the coast having its "outlet at the sea," would have its conservancy board, whereas it would be much better to combine several of these with adjoining large river-basins. In the Government Bill introduced in the House of Lords, it is proposed that adequate provision shall be made for the representation on conservancy boards of owners of property as well as of occupiers, and for that of urban sanitary authorities, and of existing conservancy authorities. The purposes of the Act are declared to be (1) the protection of land from injury by floods; (2) the arterial drainage of land; (3) the storage of water for drinking or other purposes; and (4) warping, or the irrigation of land. The Conservancy Board is to have jurisdiction over a river-basin or contiguous river-basins, and in order to procure the constitution of a board, any twenty or more owners or occupiers, or any twenty or more owners and occupiers of land of the ratable value in the aggregate of not less than £2,000 a year, may apply to the Local Government Board for a provisional order constituting the district and establishing the Conservancy Board, who may cleanse, repair, and maintain any watercourse or outfall for water, or any wall, bank, dam, or other defence against water; and they may deepen, straighten, or embank any watercourse, or raise, widen, or alter any bank or dam; and they may make any new watercourse or new outfall, or construct any reservoirs or other works for storage of water. Of course, any person injured by any work would be compensated. The occupiers are to pay the rates, and deduct the amount from the rent next due. Where the improvement of any work or the construction of any new work would be of special benefit to particular lands, the Conservancy Board may make the execution of such improvement or new work conditional on the owners of those lands consenting to bear the whole or some equitable part of the expense, and those works are to be deemed improvements of land under the Improvement of Land Act, 1864. The money required by a conservancy board for carrying out the new Act may be borrowed at interest in the manner provided by the Local Loans Act, 1875, for a term of years not exceeding 60.

A conservancy board may sell, for drinking or other purposes, any water stored by them.

The land within a river-basin is to be divided into three descriptions—lowlands, midlands, and uplands—each description of land contributing to the expenses in a different proportion. The highest rate for the upland is not to exceed one sixth of the general rate of any other lands. Whether it is just and reasonable thus to divide the lands of a river-basin must be subject for our consideration on a future occasion.

ARCHITECTURAL ASSOCIATION.

An ordinary meeting of the Association was held on Friday evening, the President, Mr. E. C. Lee, in the chair. Mr. Eales, hon. sec., announced that the second visit of the session would be held on Saturday afternoon the 12th inst. (to-morrow), when Mr. T. Roger Smith's new Hospital for Consumptives at Hampstead would be inspected.

The President read a letter from the librarians, announcing that as the time during which the library was opened had proved insufficient, an experiment would be tried for the remainder of the session of increasing the time on and after February 11, to one hour each Friday evening, from 6.30 p.m. till 7.30 p.m. on ordinary meeting nights, and from 7.15 p.m. to 8.15 p.m. on the alternate class-nights. The announcement was received with applause.

THE SANITARY WORK OF AN ARCHITECT.

Mr. Ernest Turner read a lengthy paper treating upon the general principles of sanitary science and their application to house-construction. A number of illustrations of the elementary principles of disconnection and manhole inspection, lent by Mr. Rogers Field, were hung on the wall. Beginning with aspect, he advocated the importance, wherever the architect had a choice, of planning the principal rooms to face south, so as to gain all the light possible, and to allow the windows to be frequently opened. The choice of site was even more important, but the architect seldom had an opportunity of selection, although he could do much to render it healthy by under-drainage, care being taken that these drains did not communicate with the sewers. If the site consisted of "made" ground, an attempt should be made to secure a plot that had been made for at least two years before being touched for building purposes. The deleterious effects of ground-air when drawn into houses were well known, and the evil could be guarded against by covering the entire surface of site with asphalting, or a 6in. bed of cement concrete, rammed solid. A free circulation of air between this impervious bed and the floors above should always be afforded. Too frequently, in country and suburban houses, the damp-proof course and air-bricks were not built sufficiently high in the walls, and when the adjoining paths and flower-beds were raised these protective arrangements were choked. While architects were agreed that brick-built houses were healthier when constructed with hollow walls, it was surprising to see how few houses were built in this manner. In the matter of soil-drains, he must admit that many architects, even those standing well in the profession, had shown culpable neglect. Not long since, he was called upon to investigate the cause of a pestilential odour in a London mansion, which had been built four years previously, from the plans and under the superintendence of a well-known member of the profession. Examination proved, that, owing to the defective construction of a trap and improper pipe-laying, scarcely any of the house drainage ever reached the sewer. About 3,000 gallons of sewage had to be pumped out from under the floors of two houses, a considerable quantity of the saturated earth removed, the whole place disinfected, and a bed of concrete laid. Unless the pipes were examined, many defective ones would find their way into the work. He had sometimes condemned as many as 60 per cent. of those brought on to the site, although they had been sent from well-known manufacturers. They should be laid to uniform fall in straight lines, all bends being made by bent pipes. Before the pipes were covered in, the lower end of drain should be blocked and the pipes filled with water to test the joints; the levels should also be tried. Very good work could be made with Stanford's joints, run in with Russian tallow and resin; but where the pipes ran under the floor, as they must do in most town houses, iron pipes, coated with Angus Smith's preservative solution, might be used, the joints being run with lead. In detached and semi-detached dwellings no drain need, and no drain should, run under the floors. Man-hole chambers should be constructed outside the house, where possible, so that the drain and its branches should be accessible and capable of being cleansed with a brush without disturbing the floors. House-drains should be made as small as possible, for the smaller the pipes, the less the friction, and consequently the greater the hydraulic pressure and velocity, and the less the chance of obstructions taking place. The consequence of the neglect of this principle had been that most of our sewers and drains in London were too large, and were as a result laden with deposit, which evolved foul gases. As to inclination, he had found in practice 1 in 30 none too great a fall to give to the house drain. Disconnection and ventilation of the drains, with the object of preventing sewer-air from passing into the building, were of high importance. It was complained that there was a bewildering variety of patented apparatus provided for these purposes, but he was convinced that if young architects would acquaint themselves with the general principles of disconnection and ventilation, and would inspect what had already been done by architects and engineers, they would soon master the details, and would learn that for the attainment of these objects no patent systems were necessary. In the first place, a siphon-trap should be fixed between the building and the sewer, and between the trap and the building the drain should be open for from 2ft. to 4ft. In brick houses and where the drain was not deep, an open channel with brick sides, widened out at the top and covered with an open grating, answered well; but where the drain was deep or large, a brick manhole should be provided having an open channel through which the drainage would pass through the siphon into the sewer. The soil-pipe should be carried outside the building well above the roof, undiminished in section, and he attached very little importance to any cowls. The plan of utilising the rainwater-pipe as a drain ventilator was vicious and unsatisfactory, and the pipe was of no use during a storm, when most required for ventilating purposes. Where the level of outfall would not admit of the drains being laid with a good fall, frequent flushing was necessary, and for this purpose a flushing cistern fitted with Rogers Field's annular siphon did the work effectually and satisfactorily. No waste-pipe should be carried into a drain, or even into a trap, unless there was a free current of air between the end of pipe and the water seal. The most important was the overflow-pipe from the cistern, which was even now frequently connected with the drain or with the ⊃-trap under the closet—a cause of much fatal disease. One of the best regulations ever made by the water companies was that in new houses overflow-pipes were to be formed as warning

pipes only. Amongst traps, the ⊃ and bell traps must be condemned, and by these two appliances he believed more illness had been caused than by any other. The S and P traps were the simplest and best, and for receiving waste-pipe drainage, Doulton's cheap gully trap was one of the best. Water-closets might be divided into three classes—pan, valve, and wash-out. Although pan-closets were condemned by all who knew their filthy retaining capabilities, they were still manufactured daily and by the thousand; he hoped they would ere long be prohibited under all local by-laws. The result of his experience with the valve-closet was that, if properly constructed and trapped and supplied with water, it was less open to objection than any other. The simplest apparatus was the wash-out, of which there were many varieties, including Bostel's and William White's. In what were called trapless closets, as long as the supply of water and the plunger which closed the outlet to drain were in perfect order, the operation was very good; but if the water failed, the air from the soil-pipe would enter the house through the overflow pipes when the plunger was raised. His experience was against the use of the ordinary valve-closet used without a trap under it, and, indeed, the advantages of a properly constructed water-trap under a closet out-weighed all the objections that could be raised to it. The waste from the safe should be carried through the wall and left projecting with simply a hinged copper flap to prevent draughts. For the service of water to closets, a 1½in. pipe and valve should be provided where the bottom of cistern was less than 8ft. above the w.c. apparatus; a 1-inch pipe and valve up to 12ft., and a 1½in. pipe and valve for all above. For wash-out closets the diameter should be increased in each case by ¼in. The water-companies' regulations, by which the flushing of closet was limited to two gallons, was an unsanitary measure, as that quantity was insufficient to cleanse the closet. For wash-out and hopper closets nothing was better than the siphon waste-preventer, which gave a sudden flush. Although there were many waste-not valves, none had been brought to perfection, but Tylor's seemed the best. Closets should be kept, as Dr. Thompson had suggested, at a higher temperature than the house, so that the current of air might be towards the closet instead of from it. The position of the cistern was one of the most important sanitary arrangements of a house. The cistern should have no chance of being contaminated: it must neither be too warm nor suffered to become frozen; it must be covered in and readily accessible for cleansing. In conclusion, the lecturer dealt briefly with the subject of ventilation, remarking that architects were too apt to look out for some single apparatus, some patent appliance which could be specified without any further trouble than giving the name of maker and price. They might search in vain for any one system that would satisfactorily meet every case. To introduce in the simplest and most economical manner a constant supply of fresh warm air at a rate of about 3,000 cubic feet per head per hour was the problem to which architects would do well to direct attention, and one on which he hoped to speak on a future occasion.

Mr. Rogers Field, B.A., remarked that the rule of safety in dealing with the enormous number of sanitary appliances now in the market was first to master the principles of sanitation, and then to apply them to the circumstances before you. If the action of the apparatus could not be understood, then actual trial should be made before adopting or rejecting it. These elementary principles were so simple that they were generally overlooked; they dealt with the immediate removal of all foul matters. Proceeding on this rule, the old ⊃-trap, the pan-closet, and the dip-trap were alike condemned. Stanford's jointed pipes had been referred to, and these were excellent if they fitted accurately, socket to spigot; but it was necessary that the joints of these, and any pipes, should be carefully tested when laid. That very day he had to deal with a builder who had told him that the cement-joints caused obstructions to flow in the pipes, that clay-joints were unsafe, and that he himself put nothing at all between the lengths of pipe—a practice which need hardly be condemned in that room. He agreed with the lecturer that the house-pipes used were generally too large to give an efficient scour. Manholes were often objected to on the score of expense, but he maintained that in the long run they were less costly than the breaking up of drains otherwise necessary. Where manholes were impracticable, inspection caps should be placed on the drains at the most accessible points.

Mr. E. G. Hayes wished to raise a point not sufficiently, in his opinion, considered. Mr. Turner had laid it down as an axiom that there should be no connection between the cistern for water supply and that for the closet service. Looking to the great inconvenience of multiplying household cisterns, he would ask, Was this duplication absolutely required where waste-preventers were affixed to the closet supply? He was inclined to believe there was no danger of contamination. He proposed a vote of thanks to the lecturer.

Mr. G. J. Symons was not able to show that effluvia should be conveyed from the closet to cistern if a waste-preventer were used; but as drinking-water ought to be above suspicion, he would under no circumstances permit both services to be drawn from the same container. An important point in ventilation of soil-pipes was that any reduction of the diameter of pipe increased the friction of the air, and thereby checked the current.

Mr. William White, F.S.A., reminded the last speaker that in many London houses it would be difficult to provide two apartments for the duplicated cistern, and, unless they were widely separated, it would be of little use adopting two cisterns. While he believed a waste-preventer materially reduced the danger, except where there was a leaky valve, he thought a distinct, if small, feed-cistern should furnish the closet service. The closet should be thoroughly flushed out at each using; the wash-out was the only form of basin a sanitary man would specify. With sanitary pans, deservedly so-called, there was no opportunity for the accumulation of foul air, and the operation was single and simple. He was surprised to hear Mr. Turner speak with semi-approbation of the valve-closet, which was under-trapped. For his own patented closet, he claimed that it had a waste-preventer, which could be made of any size up to 6 gals.; but practically he had found from 2 to 2½ gals. flush sufficient, if it were sudden.

Mr. E. Griffith, C.E., considered the most important principle in house drainage to be that all fæcal matters should continue in motion till they reached the outfall. If Tyler's closet were used, with an S or P trap, and the intervening length ventilated, it was almost impossible for a smell to be perceived in the house. In 999 out of a thousand cases traps, cowls, and all patent apparatus might be abandoned without risk, provided this primary point were borne in mind. At a recent sanitary congress at Exeter, architects received many severe raps, and he did not think altogether with justification; but even now they paid little attention to drains. He had that week inspected, in the West-end of London, a group of new and expensive houses where the old pan-closets were in use, and also D-traps, and the soil-pipes were unventilated; and yet one of these houses was sold for £12,000. Something must be wrong in the architect. He had never seen a house properly drained unless the drains were laid by a specialist. (Laughter.) You could not find a single Government building that was properly drained.

Mr. H. H. Collins condemned the waste-prevention regulations by which water companies deprived the users of a constant system of the effectual flushing of closets. He would defy any architect or specialist to make his apparatus perfect. His recent experience of Stanford's joints in a house building at Lancaster-gate was that the builder paid him the compliment to say he should not take another contract under him unless he added 10 per cent. to the contract. He found it utterly impossible to get these pipes to fit true, and, though he had them up six or seven times, he had even now very grave doubts whether they were perfect. His plan was to fill them with water, so as to test the tightness of the joints. He considered Potts's chamber as simpler and less costly than a disconnecting manhole. As to Professor Kerr's suggestion to build sanitary shafts as annexes to houses, they would be greater abominations than the present system.

Messrs. E. C. Robins, Douglass Mathews, and others, having spoken, Mr. Turner replied upon the discussion. He admitted that where the disconnection of a waste-preventer existed between the closet and the cistern, there was very little danger of contamination; but he had never found practical difficulty in insisting on having a separate cistern, and unless one adhered to the principle of separation, the health of the household depended on any plumber who might afterwards be employed. He thought the convenience of a manhole outweighed the initial outlay, and the cost was less than that involved in taking up drains. The architect should insist upon drainage being as much an element of the house with which he was entrusted as the construction or the decoration.

THE CAPABILITIES OF RENAISSANCE.*

By Andrew Dewar.

(*Continued from page 95.*)

THUS far we have been speaking only of carving; as a short digression; what has been the advance of *form* in 600 years? An English architect in the 13th century conceived that a nave, side-aisles, transepts, and choir, with a central and two western towers, was the most fitting shrine in which to embody his religion, and an English architect in our day confesses he cannot improve on it, though asked to provide for a different ceremonial and a changed religion. Progress of *form* in 600 years may thus be summed up as *nil*; progress in carving—*backward*.

In Renaissance proper, although the change in its ornament is not so varied as in Gothic, it is no less marked. In the early forms sculpture and ornament are sparingly introduced, and then, like Gothic, only in panels near the eye where the story could be read, or on the friezes of such a size as to be easily decipherable. As time went, on fronts like the Certosa of Pavia grew into an architectural bear-garden. Cornices, bases, pilasters, panels, niches, and window-heads caked themselves with ornament in the richest profusion—some of the latter in beautiful and imaginative designs, while the figures vied with the life. Later, the statues were exiled to pedestals on the skyline, keeping guard with hundreds of empty urns, to give a funereal aspect to the design, while the ornament near the eye was of the most regular and exact description, entirely without meaning. Lastly came on the Borromini and Rococo styles, where flying Venuses hold stone festoons with stone ribbons; where beautiful acanthus-leaves grow out of lions' tails, and circumnavigate the whole panel; where men's feet take root and devolve, contrary to the Darwinian theory, into the vegetable creation; and rose-trees, in fulfilment of the doctrine, blossom into eagles' heads. Then mouldings are stopped and "woe-begone figures in impossible attitudes cling to broken pediments for dear life"; while Venice can show a church in which huge folds of marble drapery may be seen, warranted to look like the original at so much a yard—a sight which always draws bursts of admiration from the ladies. Even cherubs, with double-action wings meeting somewhere in front and unconnected in any visible way with the body, fly over altars and pediments in picturesque profusion.

In the revival of Renaissance—for Renaissance in our day has been honoured with a revival—the absurdities are invariably first seized hold of and copied with cheap exaggerations. Festoons, ribbons, broken pediments, Darwinian monsters, *et hoc genus omne* spread themselves in the most unmeaning manner, and make us wonder if architects will ever be wholly original.

It may not be out of place to notice a conspicuous freak of the late Renaissance in sculpture, idealising new birth, we suppose, in nudity. In St. Paul's Cathedral, the great lexicographer, Dr. Samuel Johnson, stands as Adam in the garden of Eden, a veritable Hercules in form and muscle; but we doubt whether even Boswell would recognise him. Fancy the absurdity of Dr. Johnson waddling about St. Paul's as an Apollo. Another similar instance is in Milan, where Napoleon, by Canova, is posing as Mercury in his usual undress of a hat! We have seen this costume in Panama with the addition of a switch, but there the climate is more congenial than France.

We may thus sum up, as we did Gothic, the

* Paper read, Jan. 19, before the Edinburgh Architectural Association.

progress of Renaissance in 400 years, both in form and carving, as almost *nil*.

In this rambling way, which is as good perhaps as any other, we are trying to give you a general idea of what Renaissance is, what it should be, and how architects have conceived it ought to be; and this in its main features is a story which has undergone repetition in every country in Europe. One great difference, however exists between the architecture of Italy and other countries, for while it may be said to have stood still there for 200 years, or only to have made feeble copies of French art, in France the First Renaissance was succeeded by the Revival, in which the forms and details were mere copies of the old Roman, while an almost distinct style was developed in their chateaux, in the time of Francis I., and another almost equally distinct is in progress in their architecture of to-day. In Britain, not only have we had a Revival, but an extensive dinner of the styles, with courses innumerable, and that too without as much original development as the French, for our only boast is our stiff-necked Elizabethan. Thus, even in this century, we commenced with Greek and Roman, then followed a little Tudor, a taste of Venetian, some Early English, Scotch Baronial, Elizabethan, and Queen Anne, till now, sick and tired of every one, the Lord only knows whom we shall copy from next.

We have, however, some hopes of the profession. We are not inclined to believe altogether that architects are the women of the learned arts, who change their fashions as often as their prototypes their dress, and now is the age's opportunity; now, in the words of the preachers, is their day of salvation. The impulse given to the Queen Anne development of Renaissance has been so widespread, and the new forms and expressions added to our architectural vocabulary of such beauty and value, showing, also, an endless variety in the same, that a new English Renaissance has a clear course before it which may be made as distinct as the French, as beautiful, as flexible, and as durable.

In seeking to expound the capabilities of Renaissance proper, and its almost undeveloped resources, we wish it to be understood we do not disapprove of a Renaissance in any style so that it be Renaissance—new birth—and not revival. The difference between the two, you will remember, is this: in the Renaissance there is fertility of invention, originality of feature, life in the detail, and progressiveness in the form; while in the Revival invention is an incubus, thought a drug, and life a superfluity; the man who can mimic is an artist, and the perfect copyist a genius. Perhaps we may, without being invidious, call attention to some examples in Edinburgh in illustration of our meaning. In the New University building we have a good example of Italian Renaissance, for the form expresses boldly the requirements of the interior, and the ornament is subordinate, and gives emphasis to the construction. In the old college we have a medium between Renaissance and Revival, which is more worthy of commendation than blame; in the high school, a masterly treatment of Greek, which we are all proud of, though not without defects. As an example of English Renaissance, perhaps no work in the city compares with the late David Bryce's masterpiece, the Bank of Scotland; while in Gothic, as a worthy rival to the spire of any English cathedral, we would have you, in wonder and admiration, pay your devotions before the General Assembly Hall, said to be by Pugin, in Gillespie Graham's name.

Of examples of the first life of a style—which should have preceded Renaissance—we have St. Giles, Holyrood, and Trinity, all very good Gothic, but great sufferers by iconoclasts, restorers, and Ruskin's horror—railways.

Of Revival in all styles, we are unquestionably rich; so much so, there is not the slightest necessity for architects supplying us with any more. Out of dozens, we shall only single the most conspicuous, such as the National Galleries, Surgeons' Hall, Commercial Bank, Burn's Monument, Melville Monument, Fettes College, New Infirmary, St. John's Episcopal Church, &c.

Nor would we be a typical British city did we not possess magnificent works of dead art. In the modern style, we have that supreme milk-churn, the Nelson monument. In Scotch Baronial—we know not what else to call it—that German combination, puzzle and toy, the Calton Gaol. In Egyptian, that huge darning-needle, the Martyr's monument. In Gothic, those panoramic pasteboard screens, the Free Church College and Nicolson-street U. P. Church. While in Classic we have all the Established churches of the city.

Rich as Edinburgh undoubtedly is in large works of Classic architecture, she is far surpassed by Glasgow in these as well as in new examples of a pure Renaissance. So numerous are they, indeed, that it would be almost invidious to mention them; but we cannot pass over the Fine Art Gallery, *Glasgow Herald* Office, and New Club Buildings. Her architects also are numerous and well known; but the man, above all, who has made Glasgow what she is in Classic Architecture, and whose name is reverenced by her citizens as one of her greatest sons, is that of "Greek" Thomson. Thoroughly imbued with the spirit of Grecian architecture, he never wavered in his devotion. Style after style swept over the city, drawing all in its vortex, but he alone remained faithful, and the consequence is that while his contemporaries are almost forgotten, he, in his works and apart from his works, still lives, and in that masterpiece St. George's Church and spire, which dominates the city and catches the eye of every stranger, he has erected what a man of genius only could have accomplished, a building fitted to rank beside the greatest works of ancient Greece.

During the Gothic mania we were, with most architects, of opinion that Gothic was suitable for anything and everything; and the many able designs by enthusiastic and cultured architects at the time confirmed us in this; nor are we yet shaken in our belief that, if masterly handled, it is so; but how many architects have handled, it in a masterly manner, or even fulfilled the promise of their youth, and kept themselves free from from a grovelling copyism? Revival, unfortunately, is ever ringing in their ears, and not Renaissance. It is only necessary to say that when an architect forgets the best traditions of his profession and emulates the jeweller; when, as in Ely Cathedral restorations and the Prince Consort Memorial, twisted columns and inlaid precious stones take the place of natural forms and architectural history in carving; when monsters still decorate porch-doors and window-labels; when the old forms are repeated *ad nauseam*, without reference to the new requirements of the age—then it is time for the second Gothic, as it was for the first, to die.

With all due deference to Mr. Ruskin, we think the Scott Monument, for the time it was produced, one of the noblest conceptions of the human mind. Whether we take it for its fitness for the purpose required, its originality of form, or the correctness and unity of detail with which it is carried out, it tells us, as with undying authority, that the too-much forgotten name of George Kemp has only one rival in Britain—Sir Christopher Wren. Scott's monument one would therefore class as a work of true Gothic Renaissance, not Revival, for this, if for nothing else, that its form is essentially new; and herein true living art ever consists in any style and in any age. Pure detail is necessary, and its correct application is, indeed, a high accomplishment. Yet it may be, and often is, but the ornamentation of a structure otherwise dead; while original and appropriate forms to true needs, however rude the detail, so it be not false, marks the true architect, and is a living testimony to the fact of an art having progress. In some of our own Late churches (and we are proud to say they are by Edinburgh architects, and worthy members also of our own Association), we have works of a true "Renaissance"; we refer to Barclay, Brougham-street, Morningside Episcopal, and Mayfield Free Churches. In all these there is a decided French feeling; the Gothic is Continental, but it is not mere bones: the flesh and blood are visible through them, and the forms are original and appropriate. Long may it be so, and it can only be regretted once, and that is for ever, our own architects had not the opportunity, as they had the capacity, of designing a cathedral for the city worthy of the best Scottish art, the fitting representatives of the Scottish mind which evolved the Scott Monument.

While on Gothic Renaissance, we would ask why domes are not oftener constructed, and even in Gothic, why do they not oftener take the place of spires? In approaching any city it is not the spires that strike awe into the traveller, and prepare him for the beautiful in art; for to our mind they look too much like splinters broken from some wreck beneath; while a dome rising in quiet majesty into the sky, darkening the heavens with its bold bluff outline, yet veiling itself with the atmosphere of distance, is an object worth a hundred spires; a work of man's hands that never failed to please, and to increase our respect for the dignity of human conceptions. 'Tis in this direction and in the infinite combinations of domes with pinnacles and spires, that one of the roads of progress in Gothic leads, unless, indeed, mortification has not set in too badly for the present.

Having now in a general way indicated wherein the capabilities of all kinds of Renaissance consist, we will particularise with Renaissance proper. To say it would be unsuitable for churches would be to deny merit to several of the grandest churches in Christendom—St. Peter's, St. Paul's, and the Pantheon, Paris. Still we would be inclined, seeing we have a grand indigenous Gothic of our own, to erect churches in Gothic as a style suitable for the purpose, taking care at the same time to develop it from its purest period, adapting it according to the needs and requirements of each varying age. At the same time most interesting churches have been built, such as St. Eustache, Paris; and Notre Dame, Dijon; where the form is Gothic, even to flying buttresses and pinnacles, and yet the detail is essentially Classic. These churches were as interesting a study as any on the Continent. The strange effects produced by the unwonted combinations, in many instances so pleasing, showing also how they could be improved, that we wondered why the style ever became still-born. To say they are infinitely better than the machine-made copies of old parish-churches, such as hundreds throughout the country, is faint praise, and if in attempting to follow these old architects we succeeded in even approaching in their originality, it would show that at least we were men—not monkeys or Chinamen. It is our belief that in this direction only will architecture progress and keep itself alive: by Gothic, for instance, adopting Classic and Renaissance forms, and treating them with Gothic freedom, and *vice versâ* by Renaissance, borrowing from the Gothic that freedom and elasticity which at present is all its own.

For all buildings of a secular nature the Renaissance is eminently suitable. It gives all the breadth, mass, and dignity required for municipal and monumental edifices, and yet is light and airy enough for a villa. A building in Renaissance, therefore, cannot fail to please, if it is truly designed to represent its purpose; if uniformity, merely for the sake of uniformity, is avoided; if newforms are constructed for a definite purpose, and not merely for novelty; if doors, windows, cornices, chimneys, and towers are not copied, but are specially designed for special uses and the beauty of the building as a whole; if ornament is only used to emphasise construction, and sculpture and carving to illustrate the purposes of the building or tell its history. For this latter purpose natural forms are preferable, and should be introduced with a meaning. Monsters and monstrosities are to be avoided, and can only be pardoned on very exceptional grounds. Although found in good Renaissance and even good Gothic, where we pardon it as a quaint conceit on the part of the carver, no reason on earth exists for, and no meaning is conveyed by, animals with bodies ending in volutes and foliage. Animals, if introduced, should be perfect and foliage natural; nor can we see in a building which is otherwise anything but a visible indication of artistic dissolution in the architect and in the art.

In conclusion, we would wish to have it impressed on us all that the gist of all Renaissance is to be truthful; that in art, as in morals, "honesty is the best policy"; and originality, especially in form, the escutcheon of the genius.

WATER: ITS COLLECTION AND DISTRIBUTION.

On our desk lies a little octavo with the above title, written by Mr. Joseph Parry, C.E., intended as a practical handbook for domestic and general use. That such a book is wanted

* Water: its Composition, Collection, and Distribution. By Joseph Parry, C.E. London: Frederick Warne and Co., Bedford-street, Strand.

by the general public may be testified by the general confusion and inconvenience arising from a frost such as that we have recently experienced, or from the temporary stoppage of domestic services, arising from sundry causes connected with cisterns and ball-taps. There is a great want of knowledge among a large class of householders of sanitary fittings, and we have even heard absurd remarks made by people of alleged faults of screw-down taps, the bell-traps of sinks, &c. The author relates a story of a local-board engineer who recently called at a cottage and was asked to look at the tap. "It has been here," said the woman, "about a year, and scarcely any water will come out of it, and it's always leaking." The tap was one of the screw-down sort, and had never been properly open or shut, but used as a plug-tap. Other similar instances might be mentioned in the experience of all surveyors who have had to visit houses in their districts, proving an utter want of knowledge of the proper use of fittings. The first chapter of Mr. Parry's book enters into the earlier history of domestic water supply, the Health of Towns Inquiry, and other legislative measures. We quite agree with the remark made that the present tendency to centralise in a Local Government Board should be watched by district authorities with jealousy. Compliance with a Government department may be certainly purchased dearly, for, as the author justly says, it tends to lessen the sense of responsibility and represses the exercise of intelligence on the part of local bodies. Its proper function is the laying down of general principles, leaving details to local requirements. The author takes a practical view of the subject; he thinks the occupier, no less than the local authority, has a duty to perform in making himself a master of the sanitary appliances of his own house, and that it is the consumer's co-operation that is required to prevent waste.

Speaking of filtration, the author exposes the popular delusion that a patent filter is capable of purifying water. The mechanical impurities it arrests, on the contrary, foul the filter by collecting in the pores of the material, and as the Rivers Pollution Commissioners point out, myriads of minute worms were developed in the animal charcoal of one of the best house-filters, and passed out with the water when the filters were used for Thames water, and when the charcoal was not renewed at sufficiently short intervals. The most effective filtering materials are said to be animal charcoal, the magnetic carbide of iron and spongy iron. One or two forms of rain-water filters are illustrated in section. In alluding to the London Water Supply, the author advocates local administrative control, instead of irresponsible water companies, who only care to secure a good dividend, but who care not a pin about either the purity of the water delivered or its sufficiency. We also find the author objecting to the house-meter system as tending to restrict the necessary use of water, and adding to cost and maintenance, and he attempts to show that waste can be prevented by a more intelligent interest and attention to appliances.

Water-rating is discussed, and Mr. Parry shows how consumers in three towns, charged at the same water-rate, may have to pay very different amounts, as the rate is levied upon the net annual value with a 30 per cent. deduction, or upon the same with only 10 per cent. reduction, or upon the gross rent. The tables given of rates charged at different places illustrate the importance of one rateable value as the basis. The remarks on domestic appliances are practical. It is hardly necessary to speak of the desirability of the protection afforded by a well-fitting cistern cover, of ease of access to cisterns, their position in well-ventilated parts of a house, their periodical cleaning—matters easily recognised as important but seldom attended to. The greater evils of connecting water-closet with the cistern by overflow pipes, or the use of one cistern for water-closet flushing and also for drinking are pointed out and illustrated, and the merits and defects of the several kinds of closet basins are indicated, though not with the clearness we could have desired. The author describes the usual means of cutting off the entrance of sewer-gas by carrying up the soil-pipes, the use of traps, &c., but we find some useful methods are not mentioned, such as the disconnection of drain-pipes by the use of ventilating gullies, open soil-pipe heads, &c. The hints given on the different kinds of ball and other taps, regulating cisterns and pipes will be of service to the class of readers to whom they are addressed; and the author administers a few raps to architects who, in spite of warning, continue to lay pipes behind plaster-work, and neglect to provide wooden cases for them, and he says they will make no change until compelled to do so. We may usefully repeat the advice that lead pipes should not be laid in ground containing cinders or chemical refuse or lime, if they are expected to last, but that a wooden V-shaped trough should be formed covered with asphalte. A short chapter on "Effects of Frost" will be welcome to many readers, but it only mentions a few of the ordinary remedies. Outside stop-cocks are recommended on all service pipes, and a draw-off cock at the lowest point of pipe inside the building, so that water may be drawn direct from the main when a frost occurs. We have no space to dwell on the chapter devoted to rural water supply, pollution of well-water by sewage, collection of rain-water, construction of tanks, though various hints may be found of service. We may repeat that the book does not pretend to be a complete handbook of appliances; its author's aim has been to instruct the uninitiated, and to furnish the householder with useful information respecting the sundry domestic water appliances, and this task has been performed with ability and moderation.

VENTILATION: ITS PRINCIPLES AND PRACTICE.

"THE Practical Ventilation of Public and Domestic Buildings" was the title of a paper read before the Birmingham Architectural Association by Mr. William Henman, architect, of that town, on the 1st inst. The subject matter of the lecture was cast in a rudimentary form, with the aim, as the author explained, of permanently impressing the principles and facts of ventilation on the members' minds. Ventilation was defined in the act of obtaining in any inclosed or partially inclosed space a healthy atmosphere, *i.e.*, an atmosphere from which had been removed the contaminating products of putrefaction, combustion, and respiration. This could only be achieved by removing the vitiated air and replacing it by fresh air. This process would, unless care were taken, occasion discomfort to the occupants of the inclosed space in more than one way—by the influx of suspended particles in the air, and by the actual movements of currents of air. The practical problem then was to change the air without introducing dust or draught. The first part was answered by passing the incoming air through sprays or over the surface of water, or with better effect by passing it through wetted cloths or loosely-packed cotton wool, care being taken frequently to renew the straining surfaces, or the air would after a time receive greater contamination than it parted with. The second part of the problem, the avoidance of draught, was more difficult of solution, and this result was only to be effected by careful disposition of inlets and outlets, and regulation of size so as to give a diffused flow of air into and out of the apartment at the rate of not more than 1½ft. to 2ft. per second. Having explained the laws of diffusion and absorption of gases, Mr. Henman proceeded to the practical development of the laws he laid down, remarking that not only should our dwellings be ventilated, but they should be built on an impervious foundation; the streets should be laid out so as to allow of free currents of air through them, and the drains and sewers should also be supplied with means of changing the air. For dwellings natural ventilation might be relied upon, but for public buildings some artificial appliances were needed. The most potent agent in ventilation was heat. The lecturer urged that not only was the open fireplace wasteful in fuel consumption, but it could not maintain the claim often advanced on its behalf, that of being a healthy means of obtaining ventilation—the change of air effected by it was not caused in a manner most favourable to either comfort or health. In speaking of ventilation by the chimney-flue, the author mentioned that he had for some time past been experimenting, in order to devise a mode of transferring the heat of the vitiated air to the inflowing air which was to take its place. Although he had not as yet succeeded in perfecting an apparatus, he had reason to hope a good result might yet be obtained. The air to be introduced into a room should be obtained from as pure a source as possible; the air-ducts should be short and kept clean; inlets and outlets should be as large and numerous as practicable; direct currents from inlet to outlet should be avoided, and everything should be provided with a regulator easily accessible.

DRAINAGE.

THE fourth of the current series of Saturday afternoon lectures at the Parkes Museum of Hygiene was delivered last week by Mr. Rogers Field, B.A., M.I.C.E., who dealt with the subject of "Drainage." The lecturer observed that the essential principles of efficient drainage might be reduced to two—1st, that all foul matter should be rapidly and completely removed from the house directly it was produced; and 2nd, that there should be no back current of foul air into the house through the pipes and drains used for removing the foul matter. It was admitted by all that cesspools failed to comply with the first requirement, but the objectionable quality of the cesspool, that of retaining decomposing matter, reappeared in many of the traps that were daily being laid in our kitchens, sculleries, and closets; amongst these might be classified the dip, or mason's trap, the ⊃ trap, and the pan-closet. To show the necessity for making drains self-cleansing, and for giving a sudden flush, Mr. Field gave experiments with the simplest form of closet apparatus, and proceeded to explain the various modes of jointing drain-pipes. In conclusion, the principle of disconnection was explained, and the importance was insisted upon of having regular and periodical examinations of the drainage of a house by a well-qualified man.

CHIPS.

Weddington Church, near Coventry, a building re-erected in 1733, was reopened on Wednesday week, after restoration. New roofs of pitch-pine have been constructed, and fresh mullioned windows placed in the walls. The chancel floor has been raised and furnished with oak stalls for the choir, and with new communion-table and altar-rail. The pulpit and font have been set on stone bases, a chancel-arch erected, the nave-floor laid with Minton's tiles, and a new porch constructed. The work has been carried out by Messrs. Fox, of Atherstone, from the plans of Mr. A. W. Blomfield, M.A., of London.

The second section of the tramways through Ipswich was officially inspected by Major-General Hutchinson, on behalf of the Board of Trade last week. Mr. P. S. Bruff is the engineer. The line is a little over a mile in length, and connects the western suburb of the town with the main line railway station.

The church of St. Jude, Plymouth, is about to be completed, by the erection of a tower and spire at the north-west angle of the building, and rising to a total height of 120ft. The tower will be of three stages, constructed in tooled limestone, light and dark, with windows of Doulting stone; and the spire will be built in light limestone, with bands of red Mansfield and Portland quoins. Messrs. Hine and Odgers, of Plymouth, are the architects, and the work is to be commenced forthwith and completed by October next.

At the East Riding petty-sessions, held at York last week, James Ray, builder, of Darlington, was fined £5 and costs for having failed to comply with the by-laws of the rural sanitary authority. It was proved that defendant had erected buildings in Francis-street, Gate Fulford, which were deficient in sanitary requirements, and had also let them without obtaining a certificate from the rural authority.

The local board of Luddenden-foot, near Halifax, at their meeting last week, adopted plans prepared by Messrs. Utley and Gray, engineers, of Halifax, for the erection of a new iron bridge.

A new school in Amberley-road, Harrow-road, W., was opened by the Chairman of the London School-Board on Monday evening. The building has cost £5,358 for erection, and accommodates 360 boys and girls and 240 infants; the site contains an area of 22,000 square feet, and cost £14,228. The mixed department of the school consists of six separate class-rooms, each accommodating 60 children.

Messrs. Wm. Walker and Co., of Bunhill-row, have supplied the mahogany chimney-pieces, counter, and office fittings, also the stoves, with hand-painted cheeks and hearths, for the Standard Life Assurance Company's new offices in King William-street, City, which we described last week.

ROYAL ACADEMY TRAVELLING STUDENTSHIP DESIGN FOR A COLLEGE.—DESIGN FOR AN OAK CABINET FOR BOOKS AND CHINA.—ARTISTS' HOMES: "WEIRLEIGH."—ST. ANDREW'S PRESBYTERIAN CHURCH, READING.

OUR LITHOGRAPHIC ILLUSTRATIONS.

DESIGN FOR A COLLEGE.

THE design we publish to-day by Mr. Walter Millard, for which the Travelling Studentship of the Royal Academy has been awarded, was made in competition with others, at the Academy during the month of October. The conditions required accommodation to be provided for a principal, vice-principal, and 40 students, with a hall, chapel, library, lecture-room, kitchen, &c., on a site measuring 150ft. by 200ft. In this design the kitchen is placed under the hall, the floor of which is raised considerably above the level of the quadrangle and reached by an external flight of steps. The lecture-rooms occupy the upper part of the entrance-gateway. An open cloister, running round three sides of the quad, leads up to the residences of the principal and vice-principal, and affords covered communication from the gateway to all the students' staircases. From one of the inside angles of the cloister rises the tower, forming a groined porch to the chapel. The bird's-eye perspective has been traced for photo-lithography by Mr. Millard from his sepia drawing.

"BUILDING NEWS" DESIGNING CLUB.—AN OAK CABINET FOR BOOKS AND CHINA.

"JACK" is again the author of the selected design, the subject being a small cabinet for books and china. Plans, elevations, and a view are given, as well as details, together with an alternative design. The scales in all cases are given on the lithographic illustration of the designs which we herewith publish.

WEIRLEIGH, BRENCHLEY, KENT.

SOME few years since, Mr. Harrison Weir (whose drawings of natural history are known probably to a wider circle of the general public than the works of most artists) wishing to pursue his favourite study of animals and horticulture, erected on the steep hill-side of the road leading from Paddock Wood to Brenchley a small "cottage ornée" with detached studio. Afterwards desiring more accommodation, he carried ont the buildings shown in our illustrations. Advantage has been taken of the slope of the hill on one side, and the rising ground in the rear on the other, to increase the effect of the buildings and meet the difficulty of the levels. The two portions—old, etched, and new, shown as black—are connected together by a handsome staircase, which is carried up in the tower, and affords access to the various levels. The materials are red brick, with Bath-stone dressings, and weather-tiling on the upper floors. Black walnut, pitch-pine, and sequoias have been used in the staircase, and joiners' work to the principal rooms. The principal stoves are of Godstone stone only, no iron or metal-work being used. The architects are Messrs. Wadmore and Baker, of 35, Great St. Helens, E.C.; the builders, Messrs. Penn Brothers, of Pembury, Kent.

ST. ANDREW'S PRESBYTERIAN CHURCH, READING.

A SQUARE site necessitated a departure from the usual type of planning, and advantage was taken of this to produce a building practicall without obstruction to sight. A line drawn from the pulpit through the four columns only cuts across the passages to the seats. Some doubt was expressed when the design was prepared as to the acoustic properties of the building, but it has proved a perfect success. Sittings for 600 persons are provided on the ground-floor and in the end gallery, but these can be increased to 900 at a slight expense by the insertion of side galleries. The materials adopted are red bricks externally, and white ditto internally; Bath stone dressings, slating for roofs, and timber and boarding for the inner ceilings. All woodwork is of pitch-pine. The work has been well carried out by Mr. Filewood, of Reading, at a cost of about £4,500, under the superintendence of the architect, Mr. John Sulman, 1, Furnival's-inn, E.C. The drawing from which the lithograph was taken appeared in the last exhibition of the Royal Academy.

CELLARS, WATER-TANKS, AND RESERVOIRS.

IN the memoranda respecting materials issued by Mr. Robert Rawlinson, C.B., as an appendix to his "Suggestions" for main sewerage and water supply, some useful remarks are made on the construction of concrete tanks and reservoirs. It is recommended, for instance, that where concrete is substituted for brickwork, the concrete should be one-third thicker than brickwork, and the same rule is applied to retaining-walls. These, to be safe, it goes on to say, "should have cohesion and gravity equal, at the least, to four times the moving weight to be retained, and should have drains through their substance, from back to front, to permit of drainage and prevent any accumulation of water behind the retaining-wall." Experience in the construction of underground tanks, sewage and water receptacles, and even large basements, has been bought dearly in many instances, owing to the want of due precaution in excavating the site, in rendering the bottom water-tight, and in making it firm and unyielding to the water under pressure. It is useless to depend on a layer of clay-puddle upon a bottom of porous gravel or sand without a preparation of the surface, and for this purpose nothing can be safer than Portland lime concrete of sufficient thickness, which should extend under the side-walls of the reservoir or tank. In the construction of underground cellars in water-logged districts, the architect has to consider the conditions of stability required for a tank subject to pressure from below, and all round. If he fails to meet them, his employers suffer the periodical inflow of water whenever the soil is surcharged with rain, or the water-level rises. Many districts in London have suffered from this cause of late, and we think the attention of sanitary authorities should be directed to the subject of underground cellars generally. At present we find no attempt made in the smaller class of houses to exclude water from cellars; the brick-paving is laid simply on the bare ground, or it is covered with a thin coating of cement, and the walls are in many cases only one brick in thickness, without drainage of any kind. It is time some legal enactment to prevent the construction of underground cellars and basements without proper drainage should be enforced, as much misery and disease are due to the prevalence of basements which are no better than defective water-tanks. The best covering for a cellar-floor is undoubtedly a layer of asphalte on a bed of concrete; but unless the walls are also water-tight, the water will find its way through the joints and the brickwork at the bottom, to prevent which the walls themselves should be rendered with asphalte on the outside. There is little check to the intrusion of water, however, if there is no drain, and the effort of the builder should, in this case, be directed to making an underground tank, without resting satisfied with the power of the cement floor and brick walls to keep out floods. We know cases in which cellars have been tinkered and patched up year after year to no purpose, in ignorance of the fact that as the underground water rises the cellar becomes no better than a porous tank, and that the only remedy is to carry off to a lower level the surplus water by drainage, or failing this, to pump dry.

NEWBURY GRAMMAR SCHOOL COMPETITION.

THE following are the names of the authors of the most noticeable designs sent in in this competition. We attributed last week the design "Experientia" to Messrs. Giles and Gough, but this was a mistake of the official who gave us the information. "Experientia" is the design of Messrs. Newman and Billing. "Experience" was the motto of Messrs. Giles and Gough.

"Newbury" (quadrangular plan), Mr. Frank T. Bagallay, 19, Great George-street, Westminster; "Postulata," Mr. J. H. Money, Newbury; "Falkland," Mr. W. G. Lewton, Reading; "Utilitas," Messrs. Bromilow and Cheers, 6, Pekin-buildings, Harrington-street, Liverpool; "Experientia," Messrs. Newman and Billing, 185, Tooley-street, London-bridge; "Compass and Square," Mr. George D. Stevenson, 11, Alexandra-park, Hornsey, N.; "I Strive to Win," Mr. G. W. Webb, Reading; "L. S. D.," same; "Design with Beauty, Plan with Care," same; "Experto Crede," Mr. James Ledingham, Bradford; "Oxford and Cambridge," Mr. Fred. Robertson Kempson, Hereford; "Manners Makyth Man," Mr. Woodman, 2, New-road, Brighton; "School," Mr. J. Treadway Hanson, 5, York-buildings, Adelphi, W.C.; "Study," Mr. Alfred Williams, 22, Southampton-buildings, Chancery-lane, W.C.; 'Druid,' Mr. C. Bryan Oliver, 15, Great James-street, Bedford-row, W.C.; "Multum in Parvo" and "Nota Bene," Mr. Edwin Dolby, Abingdon; "1881," Mr. Alfred Drewe, Margate and Didcot; 'To Be or Not To Be," Mr. C. Martin Toombs, 5, Woodbine-terrace, Leamington: "'Twas in the Prime, &c.," Mr. W. H. Romaine Walker, 19, Buckingham-street, Adelphi, W.C.; "One Lives and Learns," Mr. H. Wilkinson Moore, Oxford; "Propria Quæ Maribus," Mr. J. Martin Brooks, 35, Wellington-street, Strand, W.C.; "Licet Mihi Appelere," Mr. G. Atkinson Barnes, Newbury; "Plan," Messrs. Bickerdike and Sugden, 2, Field-court, Gray's-inn, W.C.; "Experience," Messrs. John Giles and Gough, 28, Craven-street, Charing-cross, W.C.

PARLIAMENTARY NOTES.

SOLWAY BRIDGE.—In reply to Mr. Pease, Mr. Chamberlain said, on Tuesday, his attention had been directed to the destruction of a large portion of the Solway Bridge, and he had ordered a further inquiry to be made into the matter. It was a mistake to suppose that the Solway Bridge was of the same construction as the Tay Bridge, and that the failure might have arisen from the same cause. It was true that it was constructed of wrought-iron columns and lattice-girders, like the material of the Tay Bridge, but the application was widely different.

LOCAL EXPENDITURE OF LONDON.—Mr. Firth asked the President of the Local Government Board on Tuesday whether it was a fact that the Corporation of the City of London, and the London vestries and district boards, expended annually between three and four millions sterling, and that no part of the expenditure was audited by independent or skilled auditors; and whether he was prepared to initiate such measures as might be needful for the auditing by public auditors of such accounts. Mr. Dodson—The expenditure in question is about £3,000,000 per annum. The auditors of the vestries and district boards are elected under the Metropolis Management Act by the ratepayers out of the members of those bodies who are qualified to serve as vestrymen; but no professional qualification is prescribed for the office of auditor under the Act. I am unable to say how the auditors of the Corporation are appointed, but I rather think they are appointed by the Corporation itself. There does not appear to be any power to enforce disallowances by the auditors of vestries and district boards. At the same time, however desirable it may be that such powers should be conferred, and that duly qualified public auditors should be appointed, I am not prepared to undertake measures for that purpose this Session.

THE RIVERS CONSERVANCY BILL.—On the motion of Earl Spencer, in the House of Lords on Tuesday, the Select Committee on the Rivers Conservancy and Floods Prevention Bill was nominated as follows:—The Lord President, the Duke of Somerset, the Duke of Bedford, the Duke of Marlborough, the Earl of Derby, the Earl of Sandwich, the Earl of Jersey, the Earl of Camperdown, Viscount Bury, Lord Monson, Marquess of Huntly, Lord Penrhyn, and Lord Norton.

An industrial exhibition was opened at Wigton, by the Bishop of Carlisle, on Monday week, and will close to-morrow. The chief feature is a collection of obsolete articles formerly in domestic use in the Border district.

THE PRESENT CONDITION OF THE ART OF WOOD-CARVING IN ENGLAND.*

CARVING in wood is as necessary to good architecture as carving in stone, and much more necessary. Many buildings that are not wanting in external dignity and even splendour, are finished from foundation to roof-ridge without the help of a stone-cutter, but are well fitted in the matter of wood-cutting within doors. The sole feature that gives interest to some old London houses is their carved wooden doorway and porch, *e.g.*, in Queen Anne's-gate, Westminster, and in some by-streets of the City. Wood-carving is the glory also of many of our old churches, for wood is the material with which churches, like houses, are finished. As regards architecture, we have lived to see two revivals in this century—the Pointed style, and now the Classic or Italian architecture, as naturalised here in England by Jones, Wren, and their successors. Both classes of building are absolutely incomplete without wood decoration. Architects have been in advance of carvers, and we see the exteriors of modern buildings far better understood than the interiors. Great exertions have been made by the late Sir G. Scott and other architects to train carvers of stone, but much remains to be learned and practised by the carvers of wood. We seem to have stopped half-way in our revivals, and as I wish to direct attention to a want that seems to me very serious, I must proceed to notice these revivals in detail.

Considering the rate at which the world moves, and the rapid changes of fashion, the Mediæval style has had a long reign. Now what part has wood-carving had in that revival? We have rebuilt the Houses of Parliament, and have just finished the new Law Courts, and have erected churches innumerable. In how many of the latter shall we see carved *miserere* seats, crocketed canopies, or carved shrines? What progress has been made in regard to the fitting up of civil architecture? The throne in the House of Lords is, perhaps, the best piece of work in the Palace of the Literature, but the general fittings of the building are devoid of interest. Now let any one walk into Henry VIIth's chapel, in Westminster Abbey, or that of St. George at Windsor, and imagine how dull and uninteresting either building would be without the stalls and canopies that rise 15ft. or 16ft. on either side. The stall-work of both belongs to a period of decay in Pointed architecture, yet what noble achievements in woodwork these seats and canopies are! The *misereres* have brackets which serve as a sort of seat when turned up. The brackets are supported by masks, grotesque figures, or animals, with foilage, gracefully turned. The designs are quaint, humorous, and always carved with spirit. The carvers have been their own designers, and have evidently taken pleasure in their work. Perhaps a certain amount of humorous quaintness is characteristic of all good carving, whatever the date or style. Our modern churches look cold and dull, even where great sums of money have been spent upon them, from want of this kind of furniture, once so general. Then, again, as to roofs; no structures could be grander than the great wooden roofs of the Middle Ages. Some were supported by king-posts, queen-posts, hammer-beams, and a forest of smaller supports: intricate, yet not without regularity and order: and always having figures of angels with outstretched wings on the ends of the hammer-beams. Perhaps such costly undertakings are scarcely to be hoped for in our times. Yet the hall of Lincoln's Inn, with a beautiful roof, was erected by Mr. Hardwicke 40 years since. With the exception of occasional restorations of college halls, I doubt whether we have followed the example set so long ago. Another fine form of roof or ceiling one would gladly see reproduced more constantly is that of square-panelling with carved leaf-work on the points of intersection. Most of the ceilings in modern churches, or in houses built in the Mediæval style, are merely panelled with rails moulded by the plane. Carved leaf-work of this kind—light, bold, broad, and sinewy—though it is not of extraordinary difficulty, cannot be added to ordinary panelled work, because of the cost. As we see it in old work, it is simple and coarse, but effective. It does not require an accomplished hand for its execution. Yet the quick, ready hands from which such work ought to be produced with ease and at moderate cost, cannot be found. In making such a statement, I feel bound to acknowledge the services to wood sculpture of Mr. Brindley and his pupils. He has restored stall-work and tabernacle work of all kinds. But such skill is confined to very few firms in London, Peterborough, and perhaps one or two other favoured cities. We have nothing like the amount of skill and talent in the wood-carver that we can resort to in masons and carvers of stone. If the Mediæval revival has not seen a lively and growing school of architectural wood-carvers, neither can we point to any solid achievements in modern and Mediæval furniture. One or two light and well-constructed pieces, such as sideboards, buffets, &c., have been seen in the great International Exhibitions. But in furniture, far higher accomplishments are required of the carver. If we are to go on building, fitting up interiors, and making Mediæval furniture, it is in the direction here indicated that we want training and practice. Something should be said as to the treatment of carved woodwork and carved furniture. Old work was partially gilded. In roofs where it had little light upon it, it was painted and gilt. It was never covered with glossy varnish, as so much of our modern woodwork is.

Let us turn now to the decorative woodwork of a later period—that purely domestic style which we call Elizabethan. It belongs, in reality, to the earlier revival in this country of Classic or Italian architecture. It was neither so artistic in outline, nor so fine in detail, as the art of the time of Henry VIII., but it was executed when the kingdom was more or less isolated from Continental Europe, and our style of architecture, and of the woodwork and sculpture that belongs to it, became national. It is the Elizabethan house, its interior panelling, its fanciful carving, and massive furniture, which has retained so great a popularity down to our own times. Country houses of this kind have been refitted, and others built in recent times, and we continue to build them still. All the woodwork of the old houses has a distinct and natural character. But it had this character owing to certain national prejudices, and to the difficulties that stood in the way of sending artists to Italy, to study in Rome or Florence. Nevertheless, builders and projectors of Elizabethan houses aimed at following the lead of the artists of Italy. Italian wood-carvers adopted the mouldings, capitals, brackets, arabesques, and leaf-work, which they found on ancient monuments. Though they borrowed these details from architecture, they modified, simplified, or multiplied them, according to their opportunities and the nature of the materials in which they had to work. In this respect, they did what wood-carvers had done for the Pointed style. The egg-and-tongue, the drip moulding, the ogee mouldings covered with leaf-work, had all been adapted to their service. But, in the hands of the earliest and finest carvers, an immense variety was introduced into these important elements of decoration. So also with capitals and brackets: the Classic acanthus was put to universal use. It was varied in ten thousand ways. Yet we recognise in all these Italian capitals, or brackets, or scroll-work, in which this leaf is used, the old type. We cannot but see, moreover, what a pregnant type of foliage it is, and how inexhaustible in its application, offering an endless field for variety, and yet preserving that unity which is one of the great principles of art. We must keep this Italian wood-carving before the mind, if we wish to understand that of our own country. The peculiar character of our own Elizabethan art was due to our firmer hold of old Mediæval ideas. The Elizabethan house was still surrounded by a moat. It had courts and gate-houses. The doors were old ledge-doors of massive oak, sometimes pierced with shot-holes. Then we preserved the old tradition of one vast room, or hall, to which withdrawing-rooms, and libraries, and galleries were offsets. The entrance was a passage panelled off from it, so that access could be had through it to the rest of the house. Over this passage a gallery commonly led from one side of the house to the other, still across this great hall. These panelled screens and galleries are richly decorated with carving of several kinds. A huge fireplace was provided on one side. The upper end was raised, and the handsomest seats were placed there. The walls were panelled with oak, to a height of ten or twelve feet. These noble halls are "the making" of the Elizabethan house, as they had been of the earlier Tudor houses, and of old castles, and manors, and granges, time out of mind. The architectural disposition, inside and out, was, in great measure, dictated by that of the old Pointed style. The Renaissance was adopted with enthusiasm, but the parts and details were fitted to a system of mullioned windows, pointed roofs, and Tudor arches. Builders expressed their thoughts in a borrowed language. The fireplace was put together over a Tudor arch, like all the doorways of the house. Round arches were of late adoption. The hall-screen had Classical columns, capitals, and brackets. Terminal figures, with Ionic capitals, supported the large and projecting cornices. Both in these large screens and the chimney fronts, the details are curiously mixed in character, but they retained to a great degree their abstract and conventional design. In the richest and best examples of screens and fire-places, figure sculpture is employed. Arabesque work was carved with spirit, and used to cover imposts, or panel surfaces, or coupled together and spread out into cornices, and the upper borders of continuous panelling. Another favourite element of decoration is that scroll work of flat relief, with bosses of turned and split wood at intervals, called strap-work. The cornices of chimney-pieces, or screen divisions, are often interrupted by work of this kind lapping round it, and passing over members of the structure above or below. It would seem to be an idea borrowed from ironwork of the middle ages. This strap-work, and the larger surfaces of it round heraldic scutcheons, borrowed, probably, from the notched and curled edges of boiled and stamped leather, are very effectively employed in Elizabethan woodwork. The furniture of this period has huge acorn table-legs, with gadroon ribs on the upper and acanthus leaves on the under surfaces. The same acorn shape, elongated, serves for stair-balusters, and for supports to sideboards and cabinet-fronts. Other notable objects of furniture are the bedsteads. The bed-heads are divided into recessed panels, and the tester is supported by huge acorn posts, sometimes by fluted columns, much diminished as they rise. Rude terminal caryatid figures are generally introduced into the bed-head. Most of the details of Elizabethan woodwork are meant to be Italian. The mouldings are partly run off from the plane, partly fitted in with billets or egg-mouldings, but worked, it must be remembered, by uneducated carpenters, joiners, and carvers. If we take Elizabethan carving detail by detail, it is full of faults, shortcomings, and inconsistencies. It aims at a graceful and beautiful ideal; but it is carried out—often ignorantly—as best it can be. We recognise in it a real character; it is full of strange and even grotesque incident, but it speaks the mind of its day. And this is what gives spirit, life, and meaning to good intentions in the artist. If we attempt to reproduce woodwork belonging to that period, we must do it with some spark of love for the interesting side of an age so remarkable; and of art, so full of inconsistencies, or, at least, of compound ideas. If, on the other hand, we simply copy this old work, and with labour and neatness follow its oddities, without knowing how to modify their art in our turn, as they modified Italian art in theirs, we do but reproduce the grotesque side of it. The neater, the smoother, the more mechanical the imitation, the more glaring become the faults of our work.

(*To be concluded.*)

* A paper read by J. Hungerford Pollen, before the Society of Arts, on Wednesday last, Feb. 9th.

CHIPS.

A transept has been added to the church of All Saints, South Lambeth, and was opened on Sunday week. Mr. Sidney Smith, A.R.I.B.A., was the architect; Mr. Shepherd, of Bermondsey-new-road, the builder.

At a meeting of the Hounslow Working Men's Club, held on Thursday week, plans of club premises prepared by Mr. Palmer, architect, were adopted, and the tender of Mr. Daniels accepted at £600 for its erection.

A new passenger railway-station is about to be built at Ladyship, near Halifax, West Riding of Yorks., from the designs and under the direction of Mr. John Fraser, C.E., of Leeds. The contract has been taken by Messrs. Charnock, of Halifax.

COMPETITIONS.

BURTON-ON-TRENT MARKET-HALL. — At a meeting of the Burton town council held on Wednesday week, it was, after a discussion, decided to rescind the resolution of November 9 last, awarding the second premium of 35gs. in the market-hall competition to the author of the design numbered No. 16. It was also reported that the proof furnished by the author of No. 8, whom the first premium of 60gs. was conditionally awarded, that it could be carried out for £8,250, was, in the opinion of the markets' committee, insufficient and unsatisfactory. It was resolved to re-award the premiums—the first, of 60gs., to the author of No. 10 design; the second, of 35gs., to the author of No. 19 design, and that No. 10 design be carried out, with slight modifications, under the supervision of the author, whose name did not transpire.

CARDIFF INFIRMARY. — The annual meeting of the governors of Glamorgan and Monmouth County Infirmary was held on Tuesday week at Cardiff, when a report was presented recommending that as the author's estimate of the cost of carrying out the design marked "Health" had been raised from £14,800 (or £126 per bed) to £23,000 (or £221 per bed), whilst that for the design known as "Tria Juncta in Uno" had been fixed at £21,048 (or £210 per bed), the governors should appoint the authors of the latter design, Messrs. James, Seward, and Thomas, of Cardiff, as their architects. This was adopted, and Messrs. James, Seward, and Thomas were formally appointed architects, with instructions to modify their designs in accordance with the suggestions of the London professional referees and the medical staff; but not to exceed the original estimate without consulting the governors afresh. It may be mentioned Mr. W. Nash, F.R.I.B.A., and Captain Douglas Galton, C.B., F.R.S., were the referees, and were appointed more than four years since. Seventeen plans were submitted, of which "Health" and "Tria Juncta in Uno" were bracketed first and the premiums divided.

MASONIC HALL—CLUB PREMISES AND SHOPS' MERTHYR TYDFIL.—In response to invitations to architects, about 20 sets of drawings were submitted in the above competition, some of which, as usual, it was estimated could not be carried out for twice the sum proposed to be expended; but of the three selected for further consideration, the choice was eventually given to a design bearing the motto "Plain and Practical," by Messrs. Wing and Johnson, London and Abergavenny, Mon. This design was illustrated by a well-drawn perspective. Two well-considered sets of plans were sent from Liverpool, and others from London, Bath, Aylesbury, Clifton, and South Wales.

ROCHDALE.—In answer to their advertisement the Rochdale School Board have received designs from 38 architects for their new school at Harelands, and after various meetings reduced them to 7. The following are the mottoes of the seven:—"Utility" (3 sets), "Comme il faut," "Choose well: your Choice is Brief yet Endless," "Knowledge is Power," "Practice makes Perfect," "No. 3507," and "Experentia." The conditions specified a mixed school, with infants' department, to accommodate 500 scholars, the cost not to exceed £5,000. One of the authors estimates the cost of his design at £3,500, or £7 per scholar.

CHIPS.

The City Lands Committee of the Common Council are in favour of the Temple-bar Memorial being undisturbed at present, and a report to this effect is, it is said, to be read at the meeting of the council on the 15th inst. On the other hand, the *City Press* intimates that while the Memorial will remain, it appears highly probable that the griffin will be removed, and some other heraldic device substituted.

The Commissioners of Northern Lights have decided to erect two new lighthouses on the southern shore of the Firth of Forth: the one at Dunbar and the other on Fidra Island.

A new chapel was opened at Haslingden on Thursday, January 27th, for the United Methodist Free Church. Messrs. Potts, Pickup, and Dixon, Manchester and Oldham, are the architects; Messrs. Williams and Hope, of Dinting, near Glossop, contractors for the masonry and brickwork. Local men executed the other work. Total cost, £4,200.

Building Intelligence.

CRUDWELL.—All Saints' Church, Crudwell, was reopened by the Bishop of Gloucester on Tuesday week, after works of restoration, effected at an outlay of £1,200. The fine 15th-century tower, which was in a dangerous condition, has been buttressed and secured with iron ties; its walls have been underpinned and buttressed, the crushed arches have been removed and replaced, and a relieving arch has been built across the west end of south aisle, screening off a baptistery, and affording support to the tower. The stucco-work has been removed from the exterior, and the walls have been repaired and pointed. The common roofs and plaster ceilings with which, 50 years since, the Perpendicular open roofs over nave and aisles were replaced, have been removed to make way for others more in accordance with the fabric. The west front, first west bay, and east front of south aisle have been taken down and rebuilt, stone for stone, the chancel roof has been retiled, and the floors throughout the church made good. Messrs. Waller and Sons, of Gloucester, were the architects, and Mr. Clutterbuck, of the same city, was the contractor.

DARLINGTON.—The Wesleyan chapel at North Cowtace, near Darlington, has been reopened, after being temporarily closed during alterations. The old-fashioned pews, pulpit, and other framing, have been removed, and replaced by new open benches and rostrum. The position of aisles has been altered, wall cleading carried round the chapel, new entrance-doors provided, and a thorough system of ventilation adopted. Mr. Fred W. Brooks, Darlington, was the architect appointed, and the alterations have been most satisfactorily carried out by the North of England School Furnishing Co., Darlington.

PLYMOUTH.—A new malt-house has been erected at Plymouth for Messrs. Pitts. The malt-house covers an area of over 6,450 superficial feet. It is four stories in height, and is substantially built of rubble limestone, with brick dressings to the door and window openings. The kiln floor has an area of 1,400 superficial feet. The cost of the reconstruction will be upwards of £3,000. Mr. Charles King is the architect. Mr. A. R. Letbbridge is the contractor; the joiners' work has been executed by Mr. May; Messrs. Colling and Hocking have been entrusted with the plumbing; Messrs. Rownson and Drew, of London, have supplied the wrought-iron work for the kiln floor, and Messrs. Willoughby Bros., of Plymouth, the cast-iron columns and girders.

WIGAN.—The erection of St. Joseph's Seminary, the foundation-stone of which was laid last year, is making progress. The site is about four miles N.W. of Wigan. When completed the building will form a quadrangle, the sides of which will be about 220ft. in length. At present, however, means will not permit of more than the north and east wings being built, the former of which will be 220ft. by 41ft.; the latter 222ft. by 37ft. These two wings will include temporary chapel, refectory, lecture-room, class-rooms, thirty-six rooms for professors and students, infirmary, ambulacrum, and, above these, two large rooms extending the whole length of the wings, which can be adapted as dormitories, if needed. All the external walls are built with carefully dressed stone, of excellent quality, quarried on the seminary grounds. The plans have been prepared by Mr. James O'Byrne, and the building has been intrusted to the firm of Messrs. Roberts and Robinson.

St. Margaret's Church, Lothbury, has just been closed for entire reconstruction internally, the proposed works including the removal of galleries, replacement of old oak pews by open benches, relaying of floors, lowering of pulpit and reading-desk, and enlargement of the organ; the last-mentioned work has been taken by Messrs. Bryce and Son.

The local board of Exmouth on Wednesday week, after considering two rival schemes for the disposal of sewage, instructed Mr. Martin, of Exeter, to prepare fresh plans for sewering the town, with an outfall at the north end of the docks.

The new University College at Nottingham is approaching completion, and will be opened by Prince Leopold in June or July next.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. R. M. TUTTLE, of 13 and 15, Laight-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Cases for binding the half-yearly volumes, 2s. each.

NOW READY,

Handsomely bound in cloth, Vol. XXXIX. of the BUILDING NEWS. Price Twelve Shillings. Order at once, as only a limited number are bound up.

N.B.—Cases and vols. must be ordered through a bookseller or newsagent, as the regulations of the Post-office prevent them from being sent by post.

RECEIVED.—W. L.—H. and Co.—J. L. B.—D. and Co.—W. H. L.—J. P. M.—C. Bros.—D. M.—J. M.—E. and Co.—M. Ry. Co.—J. B.

D. J. M. (Try at Batsford's, 52, High Holborn; but we are afraid you will not be able to get a really good book. We know of none.)—C. T. (Our remark on your plan was not made inconsiderately, but after comparison with others. What we meant by "plan incoherent" was that there was a want of connection, and the corridors were too long. No remark was made on the size of schoolroom.)

"BUILDING NEWS" DESIGNING CLUB.

LIST OF SUBJECTS.

A. A cottage hospital for eight beds, for sick of both sexes, with provision for infectious cases, and with necessary offices and appurtenances. Proper floor space to be allowed, and attention to be given to ventilation and warming. Plans, elevations, and sketch. ⅛th of an inch to the foot.

B. Details of a wooden verandah, and entrance doorway to the above. Inch scale.

DRAWINGS RECEIVED.—Nil Desperandum No. 2, Nemo, H. C. in circle, Good Luck to Your Fishing, Ogmore, B. J., Con in circle, Motto A., Hubert. York, Beta, Ambition, Lancaster, Bonus Hominus (will do), In hoc Signo Vinces, Alpha, Arnold.

Correspondence.

THE INSTITUTE EXAMINATION.

To the Editor of the BUILDING NEWS.

SIR,—The letter of "Desideratum" in your issue of 28th ult. indicates a strange want of knowledge on the part of one apparently so anxious to exclude about three-fourths of his fellow-professionals from practising their calling.

He must surely be aware that it is not within the power of anybody in this country to grant licences or diplomas under any circumstances for the exclusive carrying on of our profession.

The utmost that is proposed is that the R.I.B.A. should make admission to their body contingent on the passing of some sort of test of fitness, instead of as at present merely by ballot or election. The only effect of this would be to give somewhat more standing to the members of the Institute—a matter that the public will, of course, take "quantum valeat."

The Institute has no power, any more than the Royal Academy, to regulate the terms or practice of members of its profession. Any diploma or credentials it may grant cannot affect anyone outside its own circle. Indeed, the issue of a diploma that, either directly or constructively, implied that its holder had a right to practise not accorded to other parties would be an infringement of the charter of the society, and I may add, for the information of

"Desideratum," that a pretension of the kind would be actionable at law, as an interference with the liberty of the subject.

It would serve no useful purpose to discuss here the point as to whether our profession should be an open or a limited one—there is much to be said either way, and I am giving no opinion thereon. But the time has not come for the solution of the matter in the sense your correspondent assumes when he talks so glibly of *immediately putting down* a few thousands of his fellow professionals. It will require the consent of the Legislature for this, and that will never be accorded on demand from any professional or any society; but must follow the strongly-urged demand of the *public*, who will have to be educated to see the necessity of this change.

And most assuredly the public will never be brought to see this from the point of view so undisguisedly presented by "Desideratum," that is, the limitation of practice to a select few, coupled with what he hints at, the power of preventing competition in their charges.

At present, rightly or wrongly, the public find their account in the extreme competition of professionals, and judge themselves better served by the energy and skill which this strain evokes, rather than by the talents of a select and independent few.

There is one point that I think many overlook, that is, in case of any diploma needed for practice, our Government will assuredly entrust their own Department of Science and Art, to wit South Kensington with this, not the R.I.B.A.—I am, &c.

3rd February. B.

BUILDING-STONES.

Sir,—An article in your issue of January 28th, on "Specific Gravity of Building Materials," has just come under my notice. I have not studied chemistry or other scientific subjects except in a general way; but I have some practical knowledge of building stones—thoroughly understand the qualities of some of them—and have always been accustomed, since I was capable of observation, to notice the characteristics of any stone which came in my way. The writer of the article I refer to lays it down as an axiom, that the higher the specific gravity of a stone, the more durable it is likely to be. If this were the case, granite would, of course, be far more durable than the best description of the lighter oolites. In proof that this is not the case I may mention the fact referred to in the Building News of Oct. 15, 1880. The old church of St. Mary, at Truro, had just been taken down, and although the granite spire had been built "little more than 100 years," the angles and various surfaces of the ashlar were eaten away to the extent of half an inch or more." I have come to the conclusion, therefore, that high specific gravity does not necessarily prove a building stone durable.

But I do not write to call attention to this matter only. The writer of the article speaks highly of Ancaster and Portland oolites. "The latter," he says, "has the higher crushing strength, owing probably to its containing a small proportion of silica, which is absent from the composition of other English oolites," and to this also he attributes its durability. Now this shows that the writer has not made any extended inquiries, and I beg to inform him that the Doulting oolite contains 2·04 of silica while the Portland contains only 1·20. Although I am the lessee of the Doulting Quarries, I hope, Sir, you will allow me to add this question to the writer of the article. Does he—does anyone else—know of any building in England of equal age showing so little decay as the ruins of Glastonbury Abbey; the St. Joseph's Chapel dating from the twelfth century?—the whole of which is built of Doulting stone. There is no more important quality in building stone, if its chemical properties are good, than homogeneity in structure—the colour will then be uniform.—I am, &c., Charles Trask.

Norton-sub-Hamdon, near Ilminster.

February 7.

LIVERPOOL SCHOOL OF ART.

Sir,—We have not had opportunity of seeing how this competition was decided till the illustration appeared in your last.

It is clear that one main essential stipulation has been ignored—viz., the north lighting of the principal room, the First Antique. This was a matter on which we were allowed no option, and it cost me many a tedious hour in trying to arrange these rooms for the north light.

I note the accompanying descriptive notice in yours states this large room is north-lighted, with the addition of an extra light to the east; the fact being that it is lighted directly from the east with a supplementary light only from the north. I suppose it may be said that this is the same thing. Is it so? A room north-lighted means a room with its main or sole light from the north, and this is 52ft. long and only 25ft. wide. Really the north light here is not wanted at all, and evidently put in order to suit the elevation, or possibly to give an apparent compliance with an essential stipulation.

It will thus be evident why the suggested reference to a professional umpire and a public exhibition of the plans were so cavalierly denied to us. A matter like this could never have been overlooked if pointed out at the proper time, and backed by public comment.

We have a "true bill" against the School of Art, and its first lesson is an instructive one.—I am, &c., A Competitor.

February 5.

Sir,—Thanks to your courtesy, the other competitors and myself have the opportunity denied us by the committee of seeing the plans to which the first prize was recently awarded, and, by your leave, I will now compare the arrangements thereof with the instructions issued for the guidance of competitors, and the additions thereto made by the secretary and head-master during interviews with them.

1. The conditions expressly say, that all requirements set forth in italics "*must be literally complied with*," and in italics it is as plainly stipulated that "*That the two antique rooms, the painting, life class, and head-master's rooms must be lighted from the north*," whilst the importance of this was further urged by the head-master, who, on courteously showing me over the present art school, specially pointed out the evil of light being admitted on *more than one* side of a class-room; to overcome which windows were boarded up in some cases, and in others curtains were used to minimise the difficulty of cross-lights. Judge, then, my surprise to find all these vital points simply ignored in the first prize plans, in which the antique-rooms are lighted by three windows from the north end, and *six side-windows having three other aspects*, whilst the life-room has *three* windows to the north, and *one to the south*, setting aside the instructions issued by the Science and Art Department, London, which plainly require such rooms to be "lighted from the *north side* by *a single large window*"; departures from instruction on vital points which disqualify the plan, and reproduce, on a larger scale, the evils of the existing school.

2. It was also stated to me that, whilst the style was left to the competitors, harmony with the present building would be preferred, so as to make one complete structure in effect (hence, the wing of the old building was published with the instructions), and it was further pointed out, as important for the sake of economy, that both old and new schools should be workable by the present staff, and from the present office. Again, judge my surprise to find these points also utterly ignored in the plan of the committee's choice.

Other points lie invitingly open to criticism, such as the communication between the two schools, but I will confine my remarks now to the actual departures from instructions and admitted principles of art school lighting; and these being so glaring, seem at once to account for the committee's effort to stifle criticism by refusing to exhibit the drawings submitted in competition, and compel us to the decision that if the selected plan was the best of the 86 sent in, the result is far from flattering to the profession, whilst if it is *not* the best, the selection is discreditable to the managers of an art school.—I am, &c. A Competitor.

EXTERNAL SOIL-PIPES.

Sir,—In reply to Mr. Wm. White, F.S.A., p. 140, as to why I asserted that "a soil-pipe placed outside *generates and discharges into the air* far less sewage-gas than one fitted up inside," I may observe, first, that I am rather astonished that a professed sanitarian like Mr. White should require to ask that question. As to *proof* of such being *the fact*, let a person go into a privy upon a cold or frosty day, and then little or no bad smell may be felt; but go into the same place upon a warm day, and the smell will be disgusting. Then as to soil-pipes, go up to the roof and apply the nose to the top of an outside one, and then to the top of an inside one, when, ten to one it will be found that the stink of the latter is very much in excess of that of the former. Further, apply an anemometer to each, and again ten to one that the speed of the current outwards from the inside one will be several times that from the outside one, consequently my "assertion" is proved as above stated.

The greater "warmth" and "heat" which Mr. White himself says the inside pipe gets, are the factors which tend to the production of the greater quantity of sewage-gas.* The quicker passage of the air through the soil-pipe somehow does not prevent this, as said air gradually gets warm in its course, and the longer the soil-pipe, the more does the passing air get loaded with sewage-gas from off the stinking putrefying matter adhering to the interior of the "warm" inside soil-pipe. This is one of the reasons why I wish soil-pipes to be *outside*, viz., because that a leak outside will likely do no harm to the inmates; but a leak inside, and especially from a hole in a long soil-pipe means poisoning to the breather of the foul air from the leak, said poisoning being slow or quick, according to the state of the breather's body, and the amount of disease-germs in the foul air or "gas."

Mr. White says his inside soil-pipe was all right during this frost. Now mine (I am only a temporary tenant in the house) in the middle of the house was frozen up for a fortnight, while my sink, 40ft. from ground, and discharging into an outside pipe, was used during the whole of the frost. It was coated with ice, but that did not disturb anyone that I know of.

A severe frost like this may not occur for many years, so, in this country, to put a soil-pipe of any length inside, merely for fear of frost, is, I consider, foolish.

There are thousands of people now in their graves who might still be living had it not been for breathing the bad air from soil-pipes, and many before the end of this year of grace, A.D. 1881, will be sent there *before their time* from the same cause. Some people blame "Providence" for this: I blame the Government for a good deal of it, and the public for most of the rest.

As to Mr. White's idea of protecting the external soil-pipe "by a casing of *brickwork*," I fear that would be rather clumsy-looking. It reminds one of the tower of Babel, and might cause confusion by suggesting the idea of a chimney for a subterranean wash-house. Now, although I have dabbled a little in antiquarian lore myself, I really think a neat wooden case would serve the purpose far better, and would be cheaper as well as handier, and more appropriate.—I am, &c.,

W. P. Buchan.

Sir,—It seems to me very desirable to obtain evidence of the behaviour of external soil-discharge arrangement during the late prolonged and exceptionally severe frost. We have been informed hitherto that not a single instance of freezing-up has been known to occur; yet it seems to me that, be the soil-pipe outside or inside, some of the new forms of traps used which receive the soil-pipe at the foot and ventilate by a grating to the ground (such as Stiff's and Weaver's) must, unless fixed pretty deep in the earth, be very liable to freeze and bring on a state of things such as given by Mr. White.

Again, it seems desirable to know if the freezing of water in the pan or dish of apparatus has taken place as frequently as one would expect with the open system.

I would, with your permission, invite correspondents to relate some of the lessons which I feel confident the last frost has been able to teach us.—I am, &c. A. C. G.

February 9th.

NEWBURY GRAMMAR SCHOOL COMPETITION.

Sir,—Allow me to offer a few remarks on your review of my design for the above school. I admit that the schoolroom might with advan-

* Warmth, or a medium heat is favourable to putrefaction; cold is unfavourable.

tage be a little wider; but its area gives 5·2 square feet per scholar when the 200 are assembled in it, and as the nave of a church, arranged in the usual way, generally requires 5·5 to 6 square feet per adult, including passages, I think no inconvenience would arise from crowding in the schoolroom. The sum named by the trustees, £7,000 for the whole building, rendered it necessary to avoid extravagance. The estimate did not state the value per foot cube of the various parts of the building; these might be useful in comparing with other plans. They are:—

For school and classrooms, &c., dining-hall, kitchen, &c	7d.
Dormitories and accessories	6½d.
Headmaster's house	7½d.
Laundry, washhouse, and out-offices	6d.

I have not the plans to refer to: but I believe the dormitories provide a minimum of about 700 cube feet of air for each occupant.

The assistant-master's bedroom is said not to afford the requisite supervision over the two dormitories which are placed at right angles over the school-end of the building. Bearing in mind that for this purpose, practically, the relative positions of apartments are the relative positions of their doors, another reference to the first-floor plan would show that the doors of these two dormitories are both in full view of that of the assistant-master's bedroom, and quite as near to it as the door of the dormitory on the other side.

The planning of reception-rooms is a matter about which I suppose there may be varied opinions; but a day- and a night-nursery certainly seem desirable in a house that may be occupied by a head-master with a large family of young children; and I think that the laundry and washhouse are best placed at a considerable distance from the house and school; their being added beyond the out-offices has given rise to the long low wing to which I think you seem to take exception.—I am, &c.,

Chas. H. M. Mileham.

114, Gower-street, W.C.

Sir,—In the critique given by you in your impression of last week, having reference to above competition, I notice that my design "Experientia" is set down as being "we are told the design of Messrs. Giles and Gough." Allow me to state that such is *entirely incorrect*, and should be that of Newman and Billing, Tooley-street, London-bridge. I presume that as you desire to be correct in all your reviews, you will do me the favour of stating its right authorship and you will greatly oblige.

At the same time, allow me to thank you for so favourable a criticism as that you gave. My late partner, Mr. Newman, has now been dead some years, but I retain the old name for a time longer.—I am, &c., Arthur Billing.

185, Tooley-street, London-bridge.

SHEFFIELD PARISH-CHURCH FONT.

Sir,—I was in perfect ignorance of any letters on the above subject having appeared in your paper until within the last three days, when one of the competitors gave me the information, together with a rough idea of their contents. Allow me to say that, as soon as the selection was made (which, from unavoidable causes, was not until some six weeks after the designs were submitted), I employed a person accustomed to such work to pack up and return, carriage paid, all the drawings submitted (70 in number), inclosing in each package a letter of thanks, together with the names of the successful competitor (Mr. Chas. Green, Sheffield) and the receiver of the £5 premium (Mr. Anthony Welsh, Leeds). I do not know that more could reasonably have been expected.—I am, &c,

Ensor Drury, Hon. Sec.

24, George-street, Sheffield, Feb. 8.

[The competitors, doubtless, reasonably expected the usual announcement through the professional journals.—Ed.]

THE MANAGERS OF METROPOLITAN BUILDING.

Sir,—The article in your issue of last week, under the above title, appears to me to convey an erroneous impression, as there are no "Managers of Metropolitan Buildings": a manager being one who controls; whereas the Building Act only authorises officials to supervise or look over works after they are done.

The article speaks disparaging of the narrow capacity, culture, and ability of "district surveyors." The following facts are, I submit, a complete answer to this remark:—There are 65 district surveyors in the metropolis: 39 of them are Fellows of the Royal Institute of British Architects, and 10 more are Associates; the president, Mr. Whichcord, is a district surveyor, and several of them are also members of the council. Every candidate, before being appointed to the office, is compelled by law to pass an examination at the Institute; and, strange as it may appear, the district surveyors of London, and candidates for the appointment, are the only persons in the British Empire who hold any diploma as to their capability to practise as architects; and this fact is so well known and recognised in courts of law, that it adds considerable weight to their evidence as witnesses. Generally about two-thirds of the candidates offering themselves for certificates, after examination, are rejected; and if it is objected that the test is not severe enough, this is now remedied, as the Council of the Institute who conduct the examination have recently arranged with the Metropolitan Board of Works to raise the scale of proficiency, and charge fees to pay the examiners. The article further speaks of "the want of high capacity, refinement, and consideration, &c., of district surveyors." I submit the statement is most unfair to a body of gentlemen who are, many of them, the *élite* of the architectural profession. Can it be applied to the President of the Institute, and such well-known names as Professors Donaldson and Kerr, Messrs. Edward I'Anson, F. W. Porter, G. Atchison, Edward Woodthorpe, T. Roger Smith, Charles Forster Hayward, Charles Fowler, and many others of similar character? or, taking the junior and rising members of the profession, is it true of such men as Thomas Henry Watson, T. Clarkson, Thos. Blashill, Douglass Mathews, Rowland Plumbe, and many others who have won reputation and fame at the Royal Academy and Architectural Association, and by well-known works they have executed? Surely the writer of the article has never even perused the list of district surveyors, the mere consideration of which testifies to the conscientious and honourable manner in which the Metropolitan Board of Works have, without favouritism, almost invariably selected from amongst the numerous candidates those men who have already proved their capacity. The article then speaks of "the possibility of mal-practices as regards fees," and suggests "that district surveyors be paid by salary."

Every district surveyor is compelled by law to make a correct return of the fees received by him every month to the Board of Works, and, as they are paid on a fixed scale, I fail to see how mal-practices can arise, and anyone conversant with the difficulties of dealing with speculating builders must know that *they* are the last persons to offer a bribe, their usual course being to set the law at defiance, and refuse to pay fees till forced to do so by legal process. It is simply impossible to pay district surveyors by salary. It would be most unfair to tax the whole community to pay for the official inspection of work done by builders, and contrary to reason and all legal precedent; and, while the fees in a district may amount to £300 in one year, they may, by the stoppage of building operations, drop down to £50 in the succeeding one; again, it is simply absurd to say that district surveyors should not be allowed to carry on private practice. It should be remembered that district surveyors merely supervise works, and neither control nor direct them, and almost all the official supervision throughout the kingdom as regards medical, legal, and general matters is, and must be, conducted by men holding a high position in their several professions, who, in their own practice, daily grapple with the difficulties of their practice, and no one is fit to have the official supervision of large and important works but architects who have themselves executed and directed such on their own account, and are, therefore, fully conversant with the difficulties and technical details connected with them.

The writer further insinuates "that district surveyors wink at the doings of speculative builders, while they visit with rigour the work executed in public buildings designed by architects." Here, again, he is mistaken.

With respect to public buildings, the law compels builders to carry them out to the satisfaction of the district surveyor, and the frequent occurrence of accidents in the metropolis and elsewhere has proved the necessity of this salutary rule; but as regards speculative houses, there is no such power, and if the walls are the proper thickness, and the legal precautions to prevent the spread of fire observed, the district surveyor has practically no power unless a house is so wretchedly and badly built that he can induce a magistrate to condemn it as a dangerous structure. The latter plan is now frequently adopted. There were over 3,000 dangerous structures condemned in the metropolis last year, averaging about fifty to each district surveyor. It is quite true he may perhaps get a scamping builder occasionally fined, but the fines generally inflicted are so slight that it pays builders to run the risk, and, if convicted, pay them; for instance, a magistrate who has just fined a tradesman £10 for adulterating a pint of milk or pound of coffee will let off a scamping builder who has erected several buildings in such an insecure, defective, and unsanitary manner that they may cause the spread of disease and death, with a nominal fine of 10s. But this is not the fault of the district surveyor. One district surveyor, however, last year did succeed in getting a builder fined accumulative penalties to the amount of £170, and the defendant was sent to prison for six months in default. The same district surveyor has recently, at his own risk, pulled down a large quantity of work erected contrary to the law, and expended some hundreds on making the building safe; and is now suing the freeholder of the building estate to recover the money.

Scarcely a week has passed during the last year but numerous cases where district surveyors have prosecuted scamping builders have been reported in the professional journals, and not one-tenth of these brought into the courts are published. All these proceedings entail heavy losses on district surveyors as prosecutors. Can these measures be called winking at speculative builders' acts?

The writer alludes to Mr. Vulliamy, the architect of the Metropolitan Board, as only a "magnified district surveyor." For the last 18 years Mr. Vulliamy has actively superintended the whole of the architectural and surveying works connected with the grand metropolitan improvements carried on during that time by the Board of Works, and the urbanity, candour, and high sense of honour displayed by him in his dealings with the profession generally has made his name a proverb in the profession, and I submit that it is too late in the day to assert that cases referred from district surveyors to him do not meet with fair treatment at his hands; and as respects the Board of Works, not only are Mr. Vulliamy's recommendations fairly considered, but the Board has often gone out of its way to assist applicants to meet special difficulties by calling in the assistance of their engineer, Sir Joseph Bazalgette, or in cases of fire-proof construction, of Captain Shaw, and frequently they have not even insisted on the strict legal interpretation of the Building Acts.

The latter part of the article, though satirical and amusing, does not affect in the slightest degree the question referred to in the heading; but the statement that district surveyors endeavour to make their districts preserves for private practice is absolutely false, as they are compelled by law to report every case where they are themselves so employed and to get some other surveyor appointed to overlook them.

It is not for me, Sir, to complain of the part the Building News has hitherto taken with respect to bad and speculative building, and rotten and defective houses. In proceedings which I have at various times initiated or assisted at for the purpose of preventing bad building, your paper has often afforded me generous and powerful assistance; and though, perhaps, want of knowledge of the technical working of the Building Acts, and the difficulty of enforcing them, may have led the writer astray, yet it is only by the continued discussion of the question that the plague of bad building can be stayed.

But I fearlessly assert that as regards their capacity, intelligence, integrity, and zeal, the district surveyors of London are fully equal to their work, and that they are doing their duty to the utmost of their power, and that the evils we all deplore in connection with bad building are to be remedied, not by fault-finding or jealousy, but by the Press seconding the efforts of those who are doing their utmost to enforce the law as it at present stands, whilst at the

same time working for its amendment and extension.—I am, &c.,

ROBERT WALKER, F.R.I.B.A.,
District Surveyor of St. Martin's-in-the-Fields, and St. Anne, Soho.

THE FUTURE OF CEMENT.

SIR,—I have been to Auerley with Mr. Drake, and he has shown me a passage tiled with cement-tiles, some of which are red. He informs me it was done in 1870, in which case he would be correct in the assertion he made in your paper.—I am, &c.

W. H. LASCELLES.

121, Bunhill-row, London, E.C.

GLOUCESTER REREDOS.

SIR,—As I know something of the above reredos and its workers, will you allow me to correct the statement of Mr. Hems in your last week's issue? Mr. William Redfearn, of Upper Kennington-lane, London, whose early death Mr. Hems deplored, is *still living*; but he was not the sculptor of the groups and figures in the reredos, but the highly esteemed and talented gentleman, the late Mr. James F. Redfern, then of Queen Anne-street, next door to the house and studio of the great landscape painter Turner.—I am, &c.,

HENRY TERRY, Architectural and Monumental Sculptor.

34, Crawshay-road, North Brixton.

LYVEDON NEW BUILDING.

SIR,—The letters E. T. N. on the wreath surrounding the sacred monogram probably stand for EN-TOYTΩ-NIKA—In hoc (signo) vinces—in allusion to the Labarum or Imperial banner of Constantine.

Leamington, Feb. 6th. C. R. HOMER.

Intercommunication.

QUESTIONS.

[6389.]—**Stained Wood.**—The interior of a chapel, including open-timbered roof and seats, are stained dark oak. The church being rather dark, this makes things more gloomy. Can this be taken off in any way without scraping, and light stain substituted? If not, what tint could be suggested in the way of paint?—A SUBSCRIBER.

[6390.]—**Whatman's Paper.**—Some of this paper (hot pressed) I have had by me about six years, and now when coloured on it becomes very spotted, and the ink runs on it just as it would on blotting-paper. What is the cause of the defect, and is there any remedy for the same? The advice of your readers will be thankfully received by —AN OLD SUBSCRIBER.

[6391.]—**Royal Academy—Measured Drawings of Ancient Buildings, &c.**—Will some of your readers kindly give me information of the above? Is anyone eligible to compete, or must you be studying at the Academy? When must drawings be sent in, and what are the stipulations laid down? Any hints will greatly oblige—A STUDENT.

[6392.]—**Pipe-Jointing.**—Can any correspondent inform me whether the jointing of stoneware drain-pipes in cement and flaunching externally round the socket and joint with clay puddle is a bad system? It has been suggested that the clay puddle prevents the cement from setting, and destroys to a certain extent the chemical action which takes place in the process of setting. Is this so?—ENGINEER'S ASSISTANT.

[6393.]—**Dog-Kennels.**—Can any of your readers tell me the best way to design a kennel for six dogs (beagles), or what books to consult on the subject?—R.

[6394.]—**Entasis of Greek Column.**—Will some one kindly explain how to set out full size the entasis of a Greek column, or give the name of a work in which the information may be found.—VINCTUS URSUS.

REPLIES.

[6381.]—**Refinement and Neatness.**—It would be difficult, without seeing the work, to recommend any treatment for removing colour from old brickwork. If, however, the colour was made up with lime, a weak solution of hydrochloric acid, say 1 part to 8 or 10 of water, would probably remove it. It would have to be applied by rough brushes of some kind, and would probably want more than one repetition. Hydrochloric acid is cheap, about 2d. per lb., and is useful for removing lime from anything which does not itself contain much lime as a basis.—THE WRITER OF THE ARTICLE ON "REFINEMENT AND NEATNESS."

[6382.]—**Gas-Stoves.**—These articles are considered unhealthy.—F.

[6382.]—**Gas-Stoves.**—I have warmed my offices for years with Cundy's patent gas-stove, manufactured by Messrs. Carbitt and Co., of Rotherham. I have used numbers in offices, rooms, halls, shops, &c., and never in one instance heard of anything unpleasant arising from them. Indeed, it is the best stove I have met with. The construction is a terra-cotta cylinder inside an iron one, the space between receiving the products of combustion, which are taken away by a tube to either a flue or the exterior of the building. The air is admitted at the bottom of the terra-cotta cylinder, is checked in its progress upwards, and issues at a perforated top at about 110°. They are made in three sizes, and I prefer the atmospheric burner properly adjusted.—W. P.

[6382.]—**Gas-Stoves.**—I am decidedly of opinion gas-stoves are less healthy than ordinary fire-grates when there is no special means of escape for the products of combustion, and every physician of reputation condemns gas as a deadly foe to health, even when used for lighting purposes. The mischief may be considerably lessened, however, by the provision of proper outlets near or in the ceilings for the escape of the poisonous products of combustion, such as the carbonic acid and other impurities, and by proper inlets for the supply of fresh air to the stove. A ventilating opening above the stove in the ceiling, or leading to a flue, would be the best means, and the ventilating gas-burner of Rutter's should be used in all rooms where much gas is burned.—G. H. G.

[6382.]—**Gas-Stoves.**—These are more dangerous than fires, because the products of combustion, although dangerous, are not seen, like smoke from fires. Special narrow chimneys would, in many cases, require to be put in for these gas-stoves to render them as safe as fires, and even then I fear they would not be as healthy. A good fire both heats and ventilates, while its smoke gives warning of down-draughts and bad chimneys. The case mentioned at page 140 of three gentlemen fainting in a room with a gas-stove is probably only one case of many bad effects from them. Of course, like other things, they are open to improvements, but in the mean time people using them should be careful and watch their real effects.—W. P. B.

[6383.]—**Condensation on Windows.**—Put plenty of outlet ventilation above the glass through the cornice, or by means of shafts internally, up to and through the roof, if practicable.—F.

[6383.]—**Condensation on Windows.**—The only way to clear the condensed moisture is to provide good ventilation, and to preserve a sufficiently high temperature in the shop to prevent condensation taking place. There ought to be openings above the plate-glass windows, so that there may be a constant circulation of the air; but under certain conditions of the atmosphere, as when a sudden fall in the temperature takes place which deposits moisture quickly, little can be done, and I have occasionally seen well-ventilated shops subject to the mistiness.—G. H. G.

[6384.]—**Nett Measurement.**—The "nett" measurement means the dimensions of any material after deducting any surplus. Thus the granite ashlar, without the groove for caissons, would be the "nett" quantity of material.—G.

[6386.]—**Electric Bells.**—The reason "A Subscriber's" electric bells act in the way he describes may be due to two or three causes. In the first place, should the wire not have sufficient resinous insulation the moisture in the atmosphere and walls will so affect the covering that it becomes a conductor rather than an insulator, consequently the current, instead of flowing from the pushes to the instruments, will escape by the wall to earth. Secondly, if the presses are not tipped with platinum the points of contact are apt to become corroded, and so prevent the current flowing into the line. This would account for only one of the two presses in the same room acting. Thirdly, if the instruments are coarsely made the current would not be sufficiently strong, after a little use, to work them. If these points are attended to the bells will be found to act properly.—JULIUS SAX, 108, Great Russell-street, W.C.

[6387.]—**Deposit on Quantities.**—You can sue the architect for the deposit if more lenient measures have been unavailing.—G.

[6387.]—**Deposit on Quantities.**—Sue him.—F.

[6388.]—**Quantities.**—It is usual. As to its being proper is another, and somewhat open, question.—F.

[6388.]—**Quantities.**—It is customary for the architect to receive a part of the fee for quantities if he has been to the trouble of supplying the surveyor with information and explaining his drawings and specifications. The proportion he receives is generally determined by prearrangement. Sometimes it is a fourth. I do not think, however, the practice is a defensible one on the grounds of policy, and the less architects have to do with quantities the better for them.—G. H. G.

[6388.]—**Quantities.**—It is perfectly clear that an architect has not any right whatever to divide or receive part of the fees for quantities. His trouble for negotiating with the surveyor and explaining drawings and specifications, &c., is covered by his commission as architect, is part of his duty, and to require or accept from the surveyor remuneration for it would be very improper. The council of the R.I.B.A. have recently published a statement on this subject, which deserves the careful attention of "An Architect" and others who may desire to find a loophole to justify the appropriation of part of the surveyor's remuneration.—AN OLD SURVEYOR.

[6388.]—**Quantities.**—In reply to "An Architect," I should say that it is certainly not "usual" nor is it "proper" for an architect to divide or receive any part of the fee for quantities because he has been "put to some amount of trouble in negotiating with the surveyor and explaining drawings and specifications," &c. What the *negotiations* may be I do not know, but, certainly, the necesary information of telling a surveyor what the drawings and specification mean would come within the services for which the architect receives his commission. Of course, the better the drawings and specification, and therefore the better the architect, the less necessity for the *negotiations* and explanations. It might be well to quote the following manifesto, which was printed in the *Proceedings*, 1880-81, No. 5, of the R.I.B.A., and which it would be well for members of the Institute to bear in mind, and in addition to which I would recommend members to turn to By-law XXIII. The manifesto is as follows.—"Sharing Commissions with Quantity Surveyors.—It having been recently stated to the Council of the Royal Institute of British Architects that the charges made by quantity surveyors are sometimes shared by the architect, and such a practice, if it really exist, being open to great and obvious objection, the Council hereby publicly declare that for the future such practice, if proved, will be deemed conduct which, in the opinion of the Council, is derogatory to the professional character of any Fellow or any Associate of the Institute."—

A new church is about to be erected in Harder's-road, Peckam, S.E.; from the designs of Mr. C. L. Luck.

WATER SUPPLY AND SANITARY MATTERS.

ABERYSTWITH WATER SUPPLY.—A special meeting of the Town-council of Aberystwith was held last week for the purpose of deciding what steps should be taken with reference to the completion of the new reservoir; the affairs of the contractor, Mr. Thomas James, being now in liquidation. Two applications were received. The contractor's sureties asked either to be released from their obligation or to be allowed to finish the work; the trustees of the contractor's estate also offered to do the work and to pay the creditors 20s. in the £, provided a guarantee were given them by the town-council. It was resolved that as the original sureties must still be held responsible, they should be allowed to finish the work if they thought fit. They were further empowered to treat, if they chose, with the trustees, for the due performance of the contract.

Our Office Table.

WE regret to announce the sudden death of Mr. William Hoff Wontner, architect, which occurred on Wednesday, the 2nd inst., at the age of 57. The deceased had for some months complained of failing health, but was attending to his professional duties up to the time of his death, which took place at his residence after returning from business for the day. Mr. Wontner, who 30 years ago gained a medal for a design shown at the International Exhibition in Hyde Park, enjoyed good connections and a considerable private practice, but he will be better known as being for nearly 30 years associated with Messrs. Holland and Sons, during which time he carried out many large works for them, having the entire charge of designing and arranging the decorations and furniture executed by this firm. Amongst the houses referred to may be mentioned Balmoral, Floors Castle, Sandringham, Cloverley Hall, Costessy Hall, Sefton House, and Croxteth. In such extensive works as these, Mr. Wontner had many opportunities of displaying his taste and ability, especially in the alterations of a constructional character, which in several instances had to be made. In all these the deceased brought his skill as a practical architect to bear with results which always gave much satisfaction to those who employed him. The life of one who thus quietly did his work thoroughly and well deserves a record, though the importance of the above-named instances of his designs will cause his memory to remain.

THE Paris art-world is just now busy, and amateurs are looking forward to the yearly Salon. Several exhibitions which may be considered as forerunners of the great annual show opened this week. Only two of them, however, are worth especial notice, that at the Mirlitons Club in the Place Vendôme, and the one at the Cercle Artistique et Littéraire, in the Rue Volney. At the Place Vendôme the first thing that is sought after is invariably what Meissonier may have contributed. This year it is the portrait of a gentleman, evidently, from the surroundings, a sculptor. The artist has depicted his model in the most natural of positions, sitting on the arm of a large straight-backed chair. He is a man in the prime of life, and holds in the left hand a half-consumed cigar. Another great attraction is the portrait of the Prince of Wales by Bastien Lepage. The likeness is not perfect, but the picture is truthful in every detail.

THE Northern District Meeting of the Association of Municipal and Sanitary Engineers and Surveyors will be held at Blaydon-on-Tyne, on Friday, the 25th inst. The members will assemble at 12 o'clock in the large room, Station Hotel, Blaydon. Those who purpose attending the meeting are desired to indicate the same by post-card addressed to Mr. P. W. Thomson, district honorary secretary, Willington Quay, Northumberland. The following papers will be read and discussed:—"Roadways," &c., by James Hall, borough surveyor, Stockton; "Wood Pavements," by R. S. Rounthwaite, borough surveyor, Sunderland. During the day the works of Messrs. Smith, Patterson and Co., sanitary ironfounders, Messrs. Douglas Bros.' ironworks, Messrs. Harriman and Co.'s pipe-works, and Blaydon bottleworks will be visited.

THE *Dublin Express* states that the restored cathedral of St. Patrick, in Dublin, "which

stands as a monument to the pious munificence of Sir Benjamin Guinness and which he bequeathed as a precious inheritance to the Church of Ireland," is already crumbling to decay. The fact is disgraceful, but it can no longer be concealed, for the most cursory observer need only look around to see the damp floors, the pillars mouldering at the bases, and the wormeaten woodwork of the pews, all bearing evidence to the progress already made in the work of destruction. The injury now proceeding is alleged to be due to defective drainage; the cathedral is built on a low site near the bed of the river Poddle, and there is a well, known as that of St. Patrick, situate in the middle of the aisle, which frequently overflows. The *Express* condemns alike the dean and chapter, the cathedral board, and the congregation who worship at St. Patrick's, and says it will be a disgrace to the whole Protestant Church of Ireland if measures be not immediately instituted for thoroughly overhauling the condition of the fabric, and investigating, with a view to remedying, the causes which have led to the mouldering and crumbling condition of the foundations.

THE annual distribution of prizes to the students of the Artisans' Institute took place on the 31st ult. at the Institute premises in Castle-street, Upper St. Martin's-lane, when a number of addresses were delivered having reference to technical and trade instruction. Sir Philip Cunliffe-Owen, K.C.M.G., C.B., presided, and referred to the steady improvement on the art side of English manufactures which had been progressing during the last few years, mentioning, as an illustration of the new position taken up, that a French manufacturer of furniture had recently visited London to purchase English goods. He trusted that when this Institute was transferred to Finsbury, and obtained the advantages to be offered by the City guilds, the members would benefit by the new opportunities offered. Amongst other speakers were Messrs. Hodgson Pratt, treasurer, and a trustee of the Institute; Philip Magnus, secretary of the City and Guilds of London Institute; H. Trueman Wood, secretary of the Society of Arts; E. C. Robins, and Professor Huntingdon, of King's College; the general tone of the meeting being congratulatory upon the prospect of the establishment of a united guilds' college in Finsbury.

WE were the first, a good many years ago, to suggest the advisability of the establishment in the metropolis of a permanent exhibition of the various materials and appliances used in building construction. The experiment was tried more than once with varying degrees of success, but never, as it seemed to us, on a sufficiently extended scale, or with the requisite attention to the necessary conditions to ensure permanent and complete prosperity. It is absolutely necessary, for the thorough development of the idea, that the founders of such an establishment should be completely disinterested and possessed of sufficient capital and energy to thoroughly comprehend the various branches of the industries they seek to illustrate. These requirements, as far as we are able to judge, will be found in connection with the Builders' and Manufacturers' Exchange and Subscription Rooms, recently opened at 205-6, High Holborn. The promoters have secured central and spacious premises, and they have gathered together a very interesting and valuable collection of materials and appliances which will doubtless be added to from time to time. Not only this, but they have in the application of many of the more important inventions connected with heating, lighting, drainage, and ventilating, adopted the best means of exhibiting the different appliances in connection therewith by applying them to the needs of the building itself, so that the architect and builder can see different systems in action almost side by side, and thus judge for himself of their merits. The venture should obtain the combined support of architects, builders, and manufacturers, and while it is characterised by the business tact and fairness which seem to have attended its establishment will doubtless do so.

HOUSEHOLDERS are sometimes summoned for not cleansing the footpaths in front of their premises; but it is turning the tables in quite an opposite direction to find a surveyor of highways charged with neglecting his duty in not removing the snow from the public roads. A case of this kind came before the magistrates at Brigg, on Tuesday. Evidence was given that for a week two sides of a road were blocked with snow varying from five to six feet in depth, that during this time the defendant employed only three old men to remove it, and that after the receipt of a justice's order five days elapsed before the road was cleared for traffic. A fine was imposed.

THE Students' Preliminary Examination of the Institution of Surveyors was held on the 25th and 26th ult. The passing of this examination is the condition of enrolment in the class of students. The subjects comprised simple mathematics, the first three books of Euclid, history, one language (ancient or modern), and the writing of an original essay. Of the eleven candidates who entered, the following, whose names are given alphabetically, satisfied the examiners, viz.—J. Crawter, A. P. Durlacher, A. Paull, R. C. Squarey, W. Tarrant, and C. E. Waring. W. Tarrant passed at the head of the list, obtaining nearly full marks in each subject. These candidates will be expected to present themselves for the final (technical) examination in April, 1883, at the close of their student course.

Epps's Cocoa.—Grateful and Comforting.—"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*—Sold only in Packets labelled—"JAMES EPPS and Co., Homœopathic Chemists, London."—Also makers of Epps's Chocolate Essence for afternoons.

CHIPS.

At a meeting held at Keighley, Yorks, last week, it was decided to erect a church in the thickly-populated district of Lawkholme, at a cost of about £2,600, and Mr. J. Bailey, of Keighley, was appointed architect.

Tenders were last week accepted for the erection of a new infirmary at Dewsbury, and amounted in all to a total of £10,864 13s. 4d.

The Llantrissant school board decided on Friday to erect new schools for 400 children at Gwawn-yr-Ergyd, near Williamstown, from the designs of Mr. Jenkin Evans, of Treorky.

The gas company of York have let the contract for a new gas-holder to Messrs. Close and Ayre, of York.

Major V. H. Vaughan-Lee, M.P., will bear the cost of restoring the chancel of the parish-church of Ilminster, one of the finest Perpendicular buildings in the West of England, and the work has just been commence by Mr. C. Trask, builder, of Norton-sub-Hamdon.

The local board of health for Croydon resolved last week to expend £5,535 on new farm buildings and manager's house at the sewage farm, at Beddington.

A new peal of bells were dedicated yesterday (Thursday) afternoon at Christ Church, Bray, near Dublin. The bells number eight, the heaviest weighing nearly 29 cwt., and measuring 54in. in diameter across the mouth. They were cast by Messrs. Taylor, of Loughborough, and have cost, with frame, about £1,000.

A parish meeting was held at Lewes on Wednesday week, to consider the question of improving and enlarging the parish-church of All Saints, a building re-erected in 1805, and having all the incongruities and defects of that period. It was decided to rebuild the church in sections, as funds permit, on an enlarged scale; and a committee was appointed to make inquiries and obtain plans.

The town council of Salisbury accepted, on Thursday week, an offer made by the Ven. Archdeacon Sanctuary, to purchase, at £750, their moiety of the interesting building known as the Old City Workhouse, and formerly as Audley House, the archdeacon stating that it was his desire to conserve the leading architectural features of the building, and to make it, in a renewed condition, a credit to the city.

The workmen in the employ of Mr. Crossley, builder, of Bromley, Kent, met at the "Duke's Head," in that town, on Saturday week, and presented a box of mathematical instruments, as a testimonial, to Mr. Simmons, who has been manager to Mr. Crossley for six years.

The 26th annual report of the Wesleyan Chapel Committee states that during 1880, 116 new chapels, costing £137,156, were opened; 15 schoolrooms, 10 ministers' houses, and other enlargements and additions, with 35 new organs, involving an entire cost of £312,548, which is less by £72,857 than the outlay of 1879, while the new chapels show a decrease of 13, both these declines being attributable to commercial depression. There are now 101 chapels in course of erection at a cost of £139,604, and about two-thirds of these are being erected in districts where there were previously no Wesleyan Methodist chapels.

Mr. H. Breston Wallen, son of Mr. William Wallen, architect, Greenwich, has been appointed secretary to the Home for Working Boys, London.

The Warnford Ecclesiastical Trustees, at their recent annual meeting, made the following grants towards the erection, enlargement, or restoration of churches situate within the ancient diocese of Gloucester:—Chalford, £15; Clifford's Mesne, £150; St. James's, Gloucester (additional) £50; Hartferry, £200; Gloucester, Raikes' Memorial, Brunswick-road, £500; Todenham (additional), £30; and Whiteshill, £200. For parsonages: All Saints, Gloucester (additional), £25; Churcham, £75; Eastleach Martin, £100; Kempsford, £100; Nympsfield, £10; Sheepscombe, £20; Taynton, £701; Womington (additional), £100; and Welford, £12.

St. Cuthbert's Church, Pandon, Newcastle-on-Tyne, has just been opened, and is built from the designs of Mr. Gibson, architect, Newcastle-on-Tyne. The interior fittings, including a handsome brass gasalier, oak litany-desk, &c., are the work of Messrs. Jones and Willis, of Birmingham.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill *Use no substitute* —[ADVT.]

Holloway's Ointment and Pills are remedies designedly placed within the reach of all sickly persons, because the treatment is easily applied, certain in its effects, and perfectly innocuous to the most delicate constitution. For all chest complaints, this Ointment rubbed briskly over the ribs night and morning gives ease, and prevents bronchitis, asthma, &c.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—London Institution. "Fruits and Seeds." By Sir J. Lubbock, M.P., F.R.S. 5 p.m.
Royal Academy. Lectures on Architecture by Professor Street, R.A. No. I. "The Study and Practice of the Art." 8 p.m.

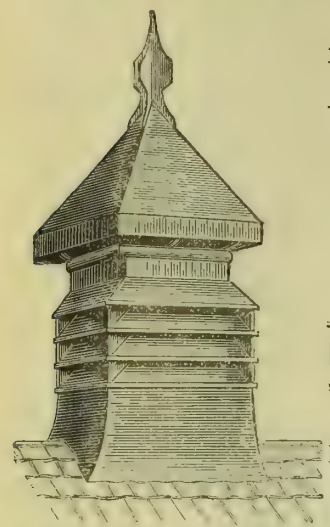
ISAAC SUMSION, NEWARK STREET, **BATH.**

Quarryman and Stone Merchant. Established 1791. Prices, delivered to any part, furnished on application. —[ADVT.]

PATENT SELF-ACTING EXHAUST VENTILATORS,



(The Invention of Mr. R. WEAVER, C.E., F.C.S., the Sanitary Surveyor,)
FOR ASSEMBLY ROOMS, CHURCHES, SCHOOLS, WORKSHOPS, STABLES, BILLIARD ROOMS, &c.
A thoroughly efficient Apparatus **at a reasonable cost,** for Extracting Vitiated Air and without mechanical motion. Also,

Ventilating Tubes, of a variety of sections and sizes, with Valves and Patent Air Filters, suitable for Apartments of every Description.

Prospectuses and Price Lists on application.

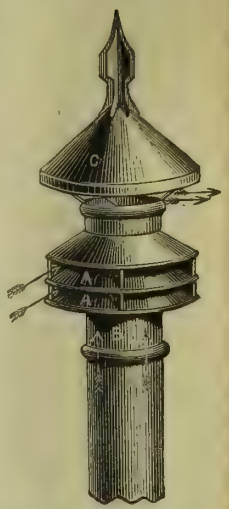
A Liberal Discount to the Trade

PATENT EXTRACTOR VENTILATOR

For 2-inch or 3-inch Pipe,
ENAMEL PAINTED,
17s. 6d.

FOR SOIL PIPES.

For 4-inch Pipe,
ENAMEL PAINTED,
25s. 6d.



THE SANITARY ENGINEERING AND VENTILATION CO.,
No. 115, Victoria Street, Westminster, S.W.

SANITARY REFORM.

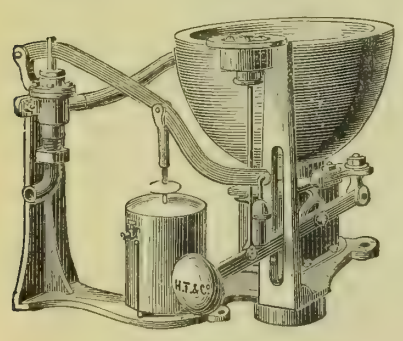
HAYWARD TYLER & CO.'S

(Sanitary Engineers, 84 & 85, Whitecross St., London.)

NEW FULL SIZE ELASTIC VALVE CLOSETS.

IN consequence of the great objections that exist in many quarters against the use of Pan Closets, H. T. and Co. have turned their attention to the production of VALVE CLOSETS of full size and good quality, at Prices low enough to be used generally, in place of Best Pan Closets.

By improvement in the pattern and system of manufacture, and the use of the most modern methods of production, they are now able to introduce to their Customers the following important Specialities:—

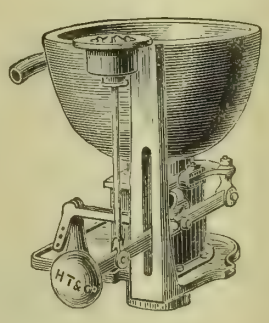


FULL SIZE ELASTIC VALVE CLOSET

With full size Bright Dish and Glass Handle. Brass Regulator or Bellows Regulator, White or Blue Basin,

£2 10s.

ORNAMENTAL BASIN, 2s. extra.



FULL SIZE ELASTIC VALVE CLOSET

With full size Bright Dish, and Glass Handle, White or Blue Basin. For use with Flushing Cistern, &c.,

£1 16s.

ORNAMENTAL BASIN, 2s. extra.

DELIVERED IN LONDON. PACKING EXTRA.

NOTE.—It is generally recognised among the best authorities that a VALVE CLOSET of proper design and construction is the most SANITARY Closet made. Hitherto the price has prevented their adoption for general purposes.

Special Arrangements of Flushing Cisterns for Valve Closets, Hopper Closets, and Urinals, to ensure Perfect Cleansing.

DOULTING FREESTONE

Answers to the description required for the best Building Stone—viz., it is "a crystalline limestone of uniform tint, homogeneous in structure, and is converted to building purposes with facility and economy."

Price at Quarry (Blocks of large average), 10d. per foot Cube. Sawing (in London), 2d. Foot Super. Railway Siding on the Works.

THE HAM HILL QUARRIES ARE NOW WORKED BY STEAM POWER.

The best GREY or YELLOW BED STONE supplied promptly. List of delivered prices of both stones, worked and in blocks, forwarded on application to

CHARLES TRASK, Norton-sub-Hamdon, near Ilminster, Somerset.

THE BUILDING NEWS.

LONDON, FRIDAY, FEBRUARY 18, 1881.

ARCHITECTS AND THEIR LECTURERS.

ARCHITECTS have been a good deal lectured lately. They have had a host of sanitary sermons preached to them, both within their own societies and out of them; but we are inclined to doubt whether sanitary science has benefited much by the persistent advocacy of those who come forward as its champions. Not that we desire in the least to disparage the intentions of those who have been attempting to enlighten the profession upon so important a subject—an admitted weak point with one class of architects; but to point out that the pill may be administered in rather too undisguised a form, or rather those who supply the sanitary medicine do so in a way calculated to offend the susceptibilities of many who look upon sanitation as but one, and not the all-important, duty of the architect. It is unfortunate that many of the persistent sticklers for sanitary perfectibility look upon well-constructed drains and traps as the be-all and end-all of good architecture, and that they are, or affect to be, blind, or callously indifferent to the other qualities of domestic arrangement and comfort which the architect is equally called upon to consider and take under his care. It is not rarely we find the sanitary engineer making distinct charges against the architect, and setting himself up in almost everything as the supreme arbiter in sanitary matters, without reflecting that his own hypotheses are often based upon the most recent experience, and are not less seldom at variance with the views of his professional brethren. The questions of drainage, disconnection of pipes, and ventilation, furnish abundant proof of divergence of opinion, and our reports of the recent discussions at the Institute indicate in a remarkable manner how difficult it is for sanitary experts to come to anything like a fair agreement upon matters of sanitary arrangement. Complicated contrivances have, we believe, driven many inexperienced architects mad; they have become bewildered with the claims of traps, ventilating arrangements, closet apparatus, and so forth; patentees have pressed their inventions with such eagerness that the professional man finds it almost impossible to steer clear of conventional complexities, and to rely upon his own sense in meeting any particular case, and in the simplest and least costly way.

It is the attempt to hedge round each new system with a kind of cleverness and complexity, to make every patent a monopoly, and to drive builders and architects to the use of some particular nostrum which, we think, needs guarding against; but the only way of doing so is for architects to acquaint themselves, as one speaker at the Association pointed out, with the general principles of disconnection and ventilation. Let us take, for example, an ordinary house. Instead of applying A. or B.'s patent ventilating trap, the same thing may be accomplished by allowing the drain from the house to the sewer to pass through an open gulley, covered by a grating, and the house soil-pipe may be carried up and left open at the top. Of course, before the house-drain entered the sewer, a siphon-trap should be placed as another check; but the open grating affords all the relief desired, and gives a free escape to any gas that may happen to pass the trap. As regards cowls, their employment is not absolutely necessary, the only requirement being that a current of air can pass uninterruptedly through the house-drain from one outlet to the other. Nothing is easier than thus cutting off the foe, while a patented apparatus, if it gives us an equally efficient result, may be costly to keep in working order. In respect of water contamination, a perfect waste-preventer would disconnect the closet from the cistern, though a separate cistern is the simplest way out of the difficulty.

Then there are a host of crotchet-mongers and hygienic reformers who are always harping upon some favourite notion, such as making all our town dwellings single-story, and converting the roofs of our houses into artificial gardens or schools. Touching the latter, we are told upper London might soon be turned into garden-schools for teaching children on the "kindergarten" system. "Wherever," remarks Dr. Richardson, "the photographer can place a studio for catching the rays of the sun, the teacher can place a garden for his school"; but probably it never occurred to the worthy doctor that of all unsightly abominations, a glass photographic studio on a house gives the greatest pain to the sensitive architect's eye. Nor has, probably, the effect of a pile of snow, several feet deep, on our house-tops been seriously considered in advising flat roofs upon our houses and schools. It is true there would be less risk of sudden avalanches of snow falling upon people in the streets, while the house below would better retain its heat by the check of radiation upwards; but we shudder to think of a thaw upon a flat surface. It has been proposed, with a greater show of reason, to turn the roofs of some of our Board-schools into playgrounds for the children, and the suggestion made by one writer is even more daringly provocative of the art-architect's sense of anguish, namely that it would be necessary to enclose the flat surface with a breast-high wire fence. What our architecture would become if our buildings were at the mercy of these would-be reformers of sanitary matters, it would be hard to predict. We should have our eaves bristling with all conceivable forms of cowls and gas-escapes, our flat roofs would be alternately the scenes of flowering shrubs, romping juveniles, or wet clothes, and the artistic hopes of many in picturesque skylines would be ruthlessly dashed to the ground. Every part of a building would be subject to the innovations of those who had new schemes of construction and ventilation; new ideas of the economical expenditure of our town areas, and sanitary crotchets would on one system make our houses lofty towers of stories, or restrict them to the limit of primitive hovels. By so long standing aloof from sanitary science, architects have brought upon themselves much of the ridicule they now receive. It is in vain they utter protests against the unfair accusations cast upon them by sanitary experts and writers in the public press; all their protestations will be vainly made till they have themselves mastered the subject, and can reply with some earnestness and show by works the faith that is in them.

An architect—a young practitioner especially—is hardly so free an agent as he ought to be when it is his fortune to obtain the erection of a large building. At the very inception of his design he is overwhelmed by a consideration of details upon which much of the success of his work depends; there is not only drainage to provide for, but the most efficient means of accomplishing it; then arise the questions of warming and ventilation, and these must be settled in his own mind before he can complacently sit down to write his specification. In this document no uncertain or floating ideas can find expression, he must resolutely fix upon some one system or another, and specify it. But he is hampered by a host of conflicting schemes and rival claims, and at last, to save thought and trouble, commits himself to some particular apparatus or patent appliance which can be specified in a few words without the trouble of making a number of inquiries about its efficiency or of adopting a simple scheme which might be far better, and at less cost meet the demands of the case. The thing is so easily done—"Provide and fix one of Mr. Nostrum's patent apparatus, &c," the name and address of the patentee is sufficient, and a load of responsibility and mechanical detail is removed from the architect's shoulders at this stroke of the pen. Whether the said apparatus ever answers is a question the architect who adopts this policy seldom cares to find out, and Mr. Nostrum is well satisfied if he gets another architect's testimonial to add to his lengthy list. The profession becomes little wiser by this mode of picking up sanitary knowledge; its members seldom take any trouble to inquire whether they might not have dispensed with a manufacturer's patent, and have secured a similar result; but the painful fact remains that the task would have been attended with considerable trouble, and details would have to be mastered. It is the mastery of details which seems to be the great obstacle to sanitary progress, and if this could be once removed, the engineer and practical sanitarian could no longer throw in the teeth of architects allegations of "inexperience" and incompetence. Might not the Institute and the Association, who have so recently encouraged discussion on these matters, establish classes for the purpose of cultivating a closer alliance between the builder and plumber, or rather between the architect and sanitary engineer, with a view to solve some of the difficulties which at present beset the former? Such discussions as those which have followed the papers read by Mr. E. C. Robins and Mr. Ernest Turner are not fruitless if they lead to mutual conviction that the work of the architect is not to study drainage and ventilation as if these were the only objects of his attention, but to learn with a good grace whatever sanitary science has to teach, just as he learns, or should learn, the other rudiments of his profession.

THE WATER QUESTION.—II.

TO prevent floods the first thing to be done of a practical nature is to ascertain the quantity of water the river will carry off in its normal condition. The normal condition of a river must be taken to be, not its original condition, and not, in most cases, its present condition, with all its obstructions, some useful and others not so, but such a condition as that would be which would allow the continuance of weirs established for useful purposes in suitable situations, the construction of which is such as to obstruct the passage of flood-waters in the least practicable degree. All other obstructions should be removed: they consist of shoals, formed by reason of continual neglect of the preservation of the regimen of the river, and of small and unnecessary weirs.

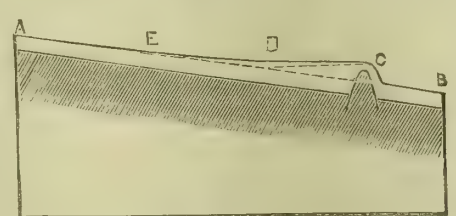
Floods, if by that be meant the whole amount of water falling in great rains, could not be "prevented" by anything that could be done, but that is not the meaning; although on some occasions the question has been presented in that light and that answer given to it. The prevention of floods means, practically, the prevention of the injurious overflow of rivers, and this means the storage or regulation of the excess of the heavy rainfalls over and above the carrying capacity of the rivers. There is a practical limit to the quantity of water which can be stored in any district; it is a limit defined by financial economy rather than by the absolute possibilities of things without any such regard; but the question of storage, in

connection with river improvements, has not always been considered in the proper light. The storage required is not of the same nature as that required for the supply of towns, except subsidiarily, and for a comparatively small portion of the water to be dealt with; it is rather the regulation of the flow of the excessive rainfalls than the absolute conservation which is, in this case, the object of "storage," and this takes it out of the category of those impossibilities which have sometimes been said to exist in this matter. The first thing, then, to be ascertained is the quantity of water the river will carry off in every part when its regimen has been restored and amended through those lands which are liable to floods; and then to regard the storage and regulation of the flow of the remainder. It has been said that they are separate questions; but they cannot be so, and unless they be considered together, in the first instance, and before anything is done in the improvement of the river itself, it may well be apprehended that either too much or too little will be done in that respect. The apprehension lies not so much against the engineer as against the politician, who may, perhaps, limit his view of the water question, in respect of floods, to the improvement of rivers only, regardless of the concurrent question of the regulation of that further quantity of water which the rivers cannot carry off as fast as it falls. If he do the one thing only, he will have to make an undue interference with existing water rights in the river, and, besides that, he may damage the adjoining land in dry times, more than would be compensated for by their relief from floods. By this, too much would be done; and if, on the other hand, the water rights be duly respected, and at the same time the required moisture in the adjoining lands be maintained in dry weather, too little would be done, for floods would still be frequent; and the water question is not one in which a given expenditure of money confers a benefit strictly in proportion to its amount, as witness the attempt to improve the river Nene; whereas if that scheme had been fully carried out as it was laid down by the engineer, and the work had been begun where the Act of Parliament directed it to be begun, that is, at the outfall, the money now lost would have contributed *pro rata* to the benefit of the whole work, and would have been spent with advantage to the land and river alike. This is not, certainly, an instance in which storage formed any part of the scheme; but it illustrates as well as any other the unwisdom of not going far enough.

In considering the question as a whole, the circumstances of the case should be considered downwards from the summit of every hill, and a comparison should be made between the original and natural state of things and their state to-day under the requirements of the inhabitants. There is plenty of evidence that the higher portions of the land we inhabit have been denuded of their finer particles and fragments by the force of water, falling in the first place as rain, which have been, and continue to be, carried down towards the sea. Whether this has always been so or not, it is certainly true of the present time and circumstances, and may without doubt be said to have been true of the circumstances of river basins before men became the proprietors of the land. It is between that time and the present that it is desirable to institute a comparison, in order to see whether the owners of the higher lands should, in justice and reason, contribute to the relief of the lower lands from floods. The denial of the upland proprietor that he contributes in any way personally to the injury of the lower lands, and that he only transmits what falls upon his land by no act of his own, holds good in respect of the water, but of the water only. If the upland proprietor allows the soil and fragments of his land to be discharged into the river he does not exercise the power he possesses to maintain his property without injury to his neighbour. It is not to the point, and does not satisfy the sense of justice, to say that he cannot prevent the soil being washed away by the rains in the natural way. He claims to exercise a right over the soil, and the sole right, to the exclusion of whomsoever, and it could easily be shown, as against him, that if he will he can keep the soil and *débris* of his land upon his own premises. That he will not go to the expense of doing this is reasonable enough, but it spoils his argument that he does not contribute to the injury of his neighbour.

To revert to the original order of things, the natural conditions are that the débris of the higher lands is washed down into the river by the rain, but also under the natural conditions of the river it was carried towards the sea, much of it being spread out and deposited along the valleys by the heavier rains, raising the land into the present meadows. Many proofs of this are found in the excavations which have been made for sewers, bridge foundations, and other works in valleys, where old roads and implements have been found at a depth of several feet below the present surface—as much as 5ft., certainly. This, of course, amounts, even in one river-basin, to a vast quantity of earth deposited in the valley, but probably much more has been carried down into the sea by the river, the heavier rains causing such a scour along the bed as to maintain a sufficient channel.

A good deal is said about weirs across rivers being the cause of floods. As a general proposition, that can neither be maintained nor denied. All that can be said is as to some particular weir, and with reference to its circumstances, which must first be known. The extent to which a weir influences the height of the water in the river above it—the amplitude of the backwater—can be found approximately for any weir, the circumstances of which are known, together with those of the river. The accompanying sketch is a section of



such part of the river above a weir as is influenced by the backwater, the vertical scale being greatly disproportionate to the horizontal.

If A B represent the surface of the river in its original state, and a weir or dam be erected in the position shown, the water will pass over it at a height C due to the quantity and the length of the weir. If from that height C a line be drawn horizontally backwards until it cuts the surface of the original flow at D, as represented by the dotted line C D, that distance, from C to D, will be about half the distance to which the surface of the water in a regular channel will be influenced by the erection of the weir; that is to say, it will be so influenced as far up as the point E, twice the distance C D. The authorities give the distance C E as being from 1·5 to 1·9 times the distance C D; but if twice that distance be taken, it will allow a margin for error, and will give the utmost limit of the backwater. From that point upwards to the next weir the river remains uninfluenced by the weir below; but it is only in rivers with considerable fall, or where there are but few weirs, or when the weir raises the height of the water but little above its original level, that there is any great length of river thus uninfluenced, in the ordinary state of the flow of the river; but the influence of the weir becomes less and less as the quantity of water coming down the river increases, until, in a very high flood, when the weir becomes drowned, its influence in checking the flood is but little. The late Mr. E. Leader Williams gave evidence before the Select Committee of the House of Lords on Conservancy Boards in 1877, that when the Severn Navigation Commissioners were before Parliament for authority to construct these weirs the question was fought over for nearly six weeks, and the result was that he arrived at a form of weir which not only pens up a certain quantity for the purposes of navigation, but facilitates the passing off of the flood water as well. It is a solid weir, with a level crest from end to end, and without sluices or means of passing off the water other than over its top. The back of the weir is rounded off to a parabolic curve, instead of being, as most weirs of the kind are, flat on the top. This improved form gives greater velocity to the water passing over the weir, and reduces its height for any given quantity passing over. This, however, is not the curious point to which allusion is made above; it is that before a weir is formed the flood-water runs over a rough bed, there being at the first of the flood but little water in the river—but meaning, presumably, only in the case of the Severn, or similar rivers—and, therefore, meeting with great obstruction to its flow from that roughness, whereas, when the weir is erected, it forms a pool of comparatively still water above it, through which the flood passes more readily than it did before; indeed, directly the first of the flood touches the upper end of the pool, it sets in motion the whole mass of water, and it is discharged more rapidly than it would be if it came into an empty channel. This was supported by Mr. J. H. Taunton, the engineer of the Thames and Severn Canal Navigation. It has been proved to have been practically so on the Severn, and that is much to the point; but it would not be justifiable to consider this proposition as having reference to rivers in general. In order to still further reduce the height of the water due to any given quantity passing over the weir, the length is greatly increased by constructing it aslant of the river course, making it, for a river 150ft. wide, 500ft. long, or thereabouts; and besides the effect which the increased length has in reducing the height of the water passing over it, the form in which the back of the weir is constructed, being that of a parabolic curve, has another effect in the same direction, for, compared with a weir which has a flat crest, this form of weir causes an increased velocity of the water in the ratio of 5 to 7. This is so when there is a free fall over the weir, but in high floods the boat traffic passes over these Severn weirs instead of through the locks, the weirs being submerged and the water-surface nearly level.

BOOKBINDINGS, ANCIENT AND MODERN.*

THERE are probably few of the artistic industries which have suffered so much from modern mechanical appliances as the art of the bookbinder. It is only natural to assume that when books were transcribed by the monks, who expended the best part of their lives on the penmanship and illumination of Bibles and missals, their bindings should have been thought worthy of an equal expenditure of artistic labour, but that

* Bookbindings, Ancient and Modern. Edited by Joseph Cundall. London: George Bell and Sons, York-street, Covent-garden.

as soon as typography and the multiplication of books took the place of hand-labour, the art of the bookbinder declined. With the multiplication of mechanical appliances, so surely did the fine-art element disappear in this country, that it was not till the reign of Queen Anne that any improvement in this respect took place. Mr. Joseph Cundall has just brought out a handsomely got-up volume, "On Bookbindings, Ancient and Modern," dedicated to Sir Henry Cole, K.C.B., an amplification, it would appear, of a book published some years ago on the same subject, but long since out of print. Mr. Cundall's work is an exhaustive treatise on the subject, and the illustrations of bookbindings, which form so attractive a feature of the present volume, have been chosen, the author says, as "being remarkable either for their propriety or their beauty."

The art of bookbinding has been made the subject of many learned treatises. S. Frognall Didbin's "Bibliographical Decameron," Arnett's "Bibliopegia," and the works of E. Fournier on French bookbinding, and Wheatley are well known, and, with many others, have been laid under contribution in the book of Mr. Cundall. The author shows that the art of the decorative bookbinder, as a recognised art, reached its climax in the 15th century, though previous to that period, and before the editions of the classics, the external bindings of illuminated manuscripts were often enriched with precious stones, and silver plates inlaid with costly gems. Mediæval volumes, such as the splendidly bound "Gospels," were chained to reading-desks and lecterns, and the baronial castle could often boast of its treasured volumes, which were prized so highly that they were attached to a table in the great hall. Mr. Cundall alludes to the splendidly adorned "Gospels" given by Leo III. to various churches, sometimes decorated with pure gold and precious stones. These adorned the high altar.

Glancing over the earlier history of the subject, and omitting allusion to the bookbinding of the ancients, as seen in the Assyrian collection at the British Museum, or the books of the Greeks and Romans—the latter of whom, it must be remembered, had their bibliopegi or bookbinders, and advanced the art to a very high state, according to the allusions given by Horace, Catullus, and other Roman writers—we may refer to the sculptured diptych as giving a faint idea of the earlier forms of the art, and especially to the bindings of the Byzantine artists, ornamented with colours and gold, bas-reliefs and enamels. "In the bindings which have been preserved of the 6th century," says the author, "precious stones begin to play a prominent part; 'Byzantine coatings,' as they were called, were principally of metal—gold, silver, and copper, gilt—into which the jewels were introduced. We must not forget that as we approach the Middle ages the bindings and the manuscripts which they enfold often belong to quite distinct periods." Cameos and intaglios, Byzantine or Limoges enamels, and bas-reliefs of ivory or metal of different periods and characters are mixed together, adds M. Libri, and he illustrates this "singular mode of botching" in an "Evangelarium" taken from La Sainte Chapelle, now in the Paris National Library. The fact was, the goldsmith claimed the external ornamentation, the artist the interior adornment, and the binder the mechanical part of the work. The "Silver book of Ulphilas," a book of the Gospels translated in A.D. 370, is an example of the style of earlier decoration. A beautifully executed book-cover in carved ivory, probably a MS. binding of the gospels, is illustrated by a fine photograph, and forms the first plate in the book we are noticing. It is now in the South Kensington Museum, and belongs to the 9th century; the cover is divided into three long panels, the Virgin and Child occupying the centre panel, while the bottom panel, extending the whole width of the book, has a representation in relief of the Nativity, and the corresponding one above has an emblematic design. The whole is in low relief, the panels divided by a bold cable moulding, or bead and reel enrichment.

The age of Charlemagne was one of great advance in the art, and Italian artists and workmen were employed. Leather and carved wooden covers, plated, ornamented with clasps of gold or silver; or gold plates set with precious stones, cameos, and other choice ornaments were common; a fine specimen of this form of binding in the British Museum, composed of a border of raised panels, and a central panel with figure of a saint, is illustrated. The ornamentation is massive, composed of silver plates with crystals and gems. So valuable were covers indeed, that after the goldsmith had finished his work the bookbinder placed over it a covering of thin leather or rough silk, called a "sendal."

The monasteries offered every facility for transcription and binding, and the monks enjoyed the privilege of both writing and binding; they prepared the parchment and leather, the latter being made chiefly from stag-hide. The real cover was made of wood, sometimes pine; but afterwards wood fell into disuse, as it harboured decay, and bindings were made of pasteboard, manufactured from old manuscripts. The Crusades, says the author, fostered the production of elaborate bookbinding, and the Arabs excelled in the delicacy and beauty of their bindings. Among the illustrations of Mediæval covers, a German manuscript of the 12th century, bound in gilt metal, decorated with champlevé enamels, crystals, and gems is given; the original is now at South Kensington.

The examples of the art after the invention of printing show a marked change in character and style. Calf and morocco were introduced as coverings in the 15th century, the basis being oaken boards in many cases; but the parchment of old MSS. was soon utilised in the making of covers after the introduction of paper, and many valuable old books were lost in this way. We read that Agobard's theological writings of the 9th century were rescued from destruction, and that Masson discovered the works of this author, which a bookbinder of Lyons was about to tear up to bind some volumes; the manuscript is to be seen in the King's library. The art reached a pitch of perfection in Italy about this time; board covers were discontinued, and calf and morocco enriched with gilt devices became general. Venice, we hear, was the school of the art, and Aldo Manuzio, the first binder of note properly so-called who set up a press in 1488. The Aldine Anchor frequently occurs. Gold tooling and chased silver coverings were practised, and a highly ornamental style sprung up in Italy, which was patronised by popes cardinals, poets, and princes. Several elaborate specimens of the bookbindings of this period are given by Mr. Cundall, one from the library of the celebrated Tommaso Maioli, printed in Rome in 1509, "Procopius—De Bello Persico." The ornament covers the whole surface, and consists of elegant scroll-work and flowers, with a richly-designed centre. A folio edition of Cæsar may be seen in the British Museum, from the same collection. The Renaissance artists displayed their utmost powers in the elaboration of bindings, and brought all the resources of art to bear. The bookbinding of France in the 16th century equalled the Italian for the sumptuous richness of the designs. Of course Italian designs were reproduced at first, till Jean Grolier and his followers formed a new school of bookbinders. Grolier was a great book-collector, who engaged Italian workmen, and the illustration given by Mr. Cundall of his copy of "Adagia of Erasmus" is an excellent specimen of the style, characterised by rich borders, and a decorative sense of the treatment of leather, which has not been surpassed. Dark brown morocco, ornamented with interlaced patterns, with a centre title, all in gold tooling, was common, and the patterns generally consisted of geometrical linked forms, many with floral devices. But we pass on to later works.

A splendid binding of the 16th century, with the arms and monograms of Henry II., and Diana of Poitiers, shows the richness and striking effect of the interlinked border and folial enrichment. Many had silver clasps and knobs, and the emblems adopted were often suggested by the names of the owners. The doleful style of death's head and cross-bones was not uncommon in the time of Henry III. Among the choicer specimens illustrated, is a binding of the end of the 16th century, from the library of Etienne de Nully.

The chapter on Bookbinding in Germany and England in the 16th century, is interesting. Binding in stamped leather became an important art after the invention of printing in Germany, and the German Bible now in the Museum at Nuremberg affords a striking illustration of corner metal-mounts in bold relief, and an elegant kind of impressed ornament on the side of cover. Another design by Hans Holbein, in morocco, with interlaced ornament, is given. English bookbinding slowly developed; embroidery on velvet was employed largely at first, and such bindings are to be seen in our national collections. Leather came into use with the invention of printing, and stamping with gold and blind tools followed. A very beautiful specimen of a gold embroidered cover of a book, printed at Augsburg in 1613, is illustrated. It is bound in maroon velvet. The author cites numerous patrons of the art from the Henrys to James I., but it is well-known that French artists were employed to bind the principal books. John Reyner, binder to Henrys VII. and VIII., is said to be the first Englishman who did work that could compare with that produced abroad, and several specimens by him are to be found in the British Museum. Grolier designs were introduced in Edward VI.'s time. During the 17th, and early part of 18th centuries, the art reached a high state of perfection, and the examples given are typical of the style. A great patron of the art was Auguste de Thou, whose library contained various costly styles. A beautiful book-cover, of Dutch workmanship, of silver gilt, is one of the best illustrations, dated about 1670, and copied from a cover in the South Kensington Museum. As illustrating the French style of the binding of the 18th century, we have, by permission of the publishers, reproduced plate XXV., showing an example of "mosaic" work, a style of bookbinding introduced by Padeloup, the binder to Louis XV. "In his search for variety, he blended together designs from the glass-painting of the Middle Ages, the flowers and suns of Louis XIV. style, and the fine dottings of Le Gascon. The excellence of Padeloup," says the author, "consists in the solidity of his bindings, in the choice of colours displayed in their ornamentation. He constantly inlaid patterns of lemon, red, or green morocco in bindings of morocco, or taffetas, with linings, and fly-leaves of gold paper." The design we give is the cover of the "Institutio Societatis Jesu," Rome, 1587, in the Bibliothèque Nationale Paris. It is sufficient to observe that during the 18th century the rage for collecting books and bindings was at its height, and it was the custom for authors to collect as well as write books.

Institutio Societatis Jesu. Rome, 1587. Example of Mosaic Work by Padeloup. (In the National Library, Paris.)

Numerous are the names mentioned by Mr. Cundall. The Duke de la Vallière was a great collector, M. Girardot was another, and Gaignat was a third. Besides Padeloup, Dubuisson and Le Monnier were noted designers in morocco. At the end of the work a chronological list of celebrated binders and patrons is appended, and the author alludes to the better taste recently introduced by English bookbinders, though we cannot, from an art point of view, join with him in the view that the binders of the present day, with a few notable exceptions, are eminent in artistic work. But we have no space to follow the author in his later chapters, and may take leave of the work with the hope that his labours will be rewarded, that the learning on this branch of literary production, which Mr. Cundall has brought into a portable compass, together with the beautiful examples of the art he has collected, will help towards a more correct taste, and that modern bookbinding will worthily take its place in the history of the art.

THE STUDY AND PRACTICE OF THE ART OF ARCHITECTURE.*

It is impossible for a professor who enters on his duties under such circumstances as have involved my appointment to this office, not to say at least a few words of somewhat personal character. Three of my brethren who, in succession, occupied this chair within my time, have all been taken away from us within a brief period. One of them was the master under whom I had studied, and to whose varied information, skill, and enthusiasm for his art I shall always feel myself a great debtor. But the last was one to whom many of you students who are here to-night are similarly indebted. Mr. Barry had, as many of you are aware, held the post of professor in this Academy for some six or seven years. His lectures were marked by the variety of the subjects which they embraced, and by the judicial impartiality which it was his aim to show in his appreciation of what was, in his eyes, good in all styles. The sad event which closed his career so suddenly interrupted last year's lectures when their delivery was but half completed. But they are shortly to be published, and will, I doubt not, be well worthy of your study and attention, as containing the advice, criticisms, and views upon our art of one who held a most distinguished place among his brethren. This is not the place or the time to say more on such a subject. But less than this I cannot say on an occasion when all of us would have been so glad that it should still have been his voice to which you listened, and his counsel that you had to accept. There is one difficulty which all professors must feel in the work which is to be done here. It is, as I think, our first duty to think of our students and their good. And in successive years it might be necessary, or, to say the least, advantageous, if the simple truths and precepts which are the foundation of all that is best in art were repeated time after time to the succeeding audiences of fresh students. And so, perhaps, it may matter little if sometimes I repeat what has been far better said before, in hopes that to some at least there may be freshness, instruction, and novelty in what I say. The real difficulty is that a professor who wishes to teach well must, of necessity, inculcate only what he himself believes to be true; and that in dealing with art, as soon as he leaves the domain of simple first principles, he comes upon ground where every view is contested, and each man's art is, to a great extent, independent of his neighbour's. And my hope is that in listening to me you will none of you forget that, after all, what I tell you is intended to be suggestive first of all. If I tell you of first principles which all acknowledge, and then give you advice which seems to sin against them, you may be sure I have not made myself understood, and in any case it is the first principle which must be held fast by. To-night, however, I shall have to confine myself very much to questions which much concern those of you more especially who are students in our Architectural School, but which may, I fear, be comparatively uninteresting to the rest of my audience. In subsequent lectures I hope I may find it possible to deal with questions of a different and pleasanter kind—less elementary, and such as all of us who wish to be artists are bound to interest ourselves in. It is a good rule of the Academy that compels you all—painters and sculptors, as well as architects—to listen to architectural teaching. But no teaching can be worth anything which tries to accommodate itself to the indifference of an audience, and it would be a mistake to assume for an instant that any of you wish to know only a little about any one of the arts, and care only to attend here because the Academy insists upon your doing so. The first test of an artist is that he should feel a real and absolute, if not an almost equal, interest in all the arts, and the painter who does not care to know something about architecture is sure, at least, never to be so good a painter as he might have been, whilst to you students of Sculpture, I would say that my art and yours are so intimately allied, neither in their highest developments being ever perfect without the aid of the other, that it is incumbent upon you, if you would excel, to know much more than merely a little about architecture. The three arts are indeed all dependent on each other. The most perfect building is that in which not only the architectural lines, proportions, and features are all good and beautiful in themselves, but one in which provision is thoughtfully and wisely made by the architect for the best display in harmony of the arts of painting and sculpture. The architect deals with outlines and masses, with light and shade, but for that deeper interest which touches one most, after these general effects have been produced, he depends, except in the vastest buildings, upon the other arts, and he must know and feel enough about them to make him competent to provide for their worthy and dignified treatment. And surely it is not less needful that the painter and the sculptor should be so well trained in architectural detail as to make it impossible for them to do or admire work in which ignorance of that art is exhibited—such ignorance being fatal in its effect wherever it exists or is conspicuous. Nor should it ever be forgotten that the study of the most permanent of all the arts has a real value if it leads all artists to consider in their work not only what is good for to-day and for the fashion of the time, but for ages to come, so that it may be looked at with love and respect by their descendants for many generations. So much only do I think it necessary to say by way of introduction to my subject for to-night, which I have selected as being one on which we ought first of all to understand each other, and on which one who is growing old may well speak decided words of counsel to you who are only on the threshold of your career. With what conception of art are you bound, then, to begin your work? The work of the architect is evidently complicated by conditions peculiar to itself. It must be useful first of all, beautiful afterwards. Unless it is useful, it is not really artistic. Usefulness may be exhibited in trifles as much as in the greatest affairs. You must realise that it is not only necessary to learn how to plan a building so as to make it most thoroughly fit for its purpose, but you must learn also how to design every detail so that it shall be the fittest for the place, and for the work it has to do. You must therefore begin by studying how to plan well, and how to build well. Good construction is the basis of good art; though even here a word of caution is required, for new modes of construction may be popular, but not good: and the only test that I know of good construction is the certainty of its being permanent. Unfortunately, you will find that this is the greatest temptation which will assail you from the first in your architectural career. You will be tempted to sacrifice solidity to some fancied necessity for ornament; but it is nevertheless the fact that many very noble buildings, of all ages, are almost absolutely devoid of mere ornament, and that no work which is not solid and well constructed and proportioned, however richly it may be adorned, is ever in the end lastingly ornamental. Consider for an instant in what way this rule affects you when in practice. The Egyptian and Greek remains—quite apart from any intrinsic beauty which they possess—affect everyone by the evidence of their

* Lectures on Architecture to Students of the Royal Academy. By George Edmund Street, R.A. No. 1: delivered Monday, Feb. 14, 1881.

admirably solid mode of construction. The somewhat unsightly masses of brickwork which are all that are at first seen of some great Roman works, such as, *e.g.*, the Baths of Caracalla, affect the senses in the same way. In Mediæval times, it is when you are traversing some passage formed in the thickness of a wall that the same feeling is excited, and in all these cases it is the respect for his work which the builder shows that reacts upon us. Nothing is ever entirely unworthy of notice that is done with this feeling, and as it would be wholly impossible to obtain, as it would also be absurd to demand, the same goodness of design in a mere temporary erection as in a permanent one, so the merit of an architectural work will almost always have some distinct relation to the solidity of its construction. The reason for putting this fact before all others which bear on the study and practice of an art is that if you have but a firm grip of it, all you have studied will bear more fruit, because it will give you in one vital point an infallible critical test for the examination of all architectural work. And if I do not attempt to teach you in my lecture much about the merely practical side of your work, you must never forget that this is in no degree whatever because I wish you to ignore what is absolutely essential, but only because it is seems to me that this Academy of the Fine Arts requires of its professors and of its students that their main devotion shall be to the artistic side of our art, with but such incidental references to its practical side as grow naturally out of or tend to illustrate and explain the other. Such references, even if only incidental, cannot be infrequent. At every turn we are met with the question whether what we have designed is the best thing possible under the circumstances, not whether it is the most beautiful—the best thing in architecture being always that which combines the most sagacious use of the materials available, the soundest construction, and the most convenient adaptation to the requirements, with thoroughly good artistic character and proportion in the mass and in all the details, and some evidence of imagination in the design. The architect has to work under limitations wholly unknown to the painter, sculptor, or musician, and yet his art requires for its perfection no less invention and imagination and loftiness of character. If we look carefully at painters' work, we are struck with the extraordinary extent to which the artist reveals himself in his work. On the canvas of a great painter you see not only the man who sat for his portrait, but almost equally the man who painted it. In a more subtle way the architect is revealed in his work. His refinement or his coarseness, his love of truth or indifference to it, are always evident. In the highest art it is the man rather than the society or the system that is seen; and as in ages when insecurity of life, tyranny of rulers, ruthlessness, or religious intolerance, were rife, their very existence involved that of men of the strongest and most heroic character, so in the same times the greatest buildings were erected. The individual man lived often a higher life, and had a higher conception of his work, than is usual in more easy and perhaps more polished and virtuous times. At the same time, though, the highest art is a reflex of the spirit of the man. The man is dominated to a great extent by the age, so that the spirit of the age is seen more or less in the architectural works of all times. Our own history will be read in ours possibly long after all other records of its work are lost, and it lies with us to secure that the record shall be that of the best features, not of the worst of our times. The lesson for you is obvious: you must cultivate in yourselves a high sense of the requirements of your art, and a persistent self-reliance and individuality. Without these you cannot be great architects. And it is more necessary to insist on this with you than with your brethren of the brush and the chisel, because your daily life may be, and too often I know is, spent in working under influences wholly hostile to this higher view. It is well to speak thus to you who are still young, and who, being so, are also generous, and I hope enthusiastic. You will soon cease to be young; but unless you maintain to the end the other qualities you will not be great artists. There may, of course, be enthusiasm of a certain sort for bad things. Many of us, I fear, fancy whilst we are doing commonplace, if not vulgar things, that our work is worthy to excite it, never really realising any of the necessary conditions. And it is worth while to ask, therefore, what is it which really does create our enthusiasm in ancient examples? Enthusiasm is not merely the highest kind of interest. This may be kindled by historical associations; but a bare field on which a battle has been fought has this. Extreme age gives interest, but it need not be lovely. Singularity of situation, of material, of adaptation to exceptional purposes, may all give interest. But none of them create real enthusiasm. And the only architectural work which does excite it is that in which you find evidence throughout, that the artist thought nothing of his own part in it, but only of the perfection of his work, of its solidity first, and then of its refinement. Try by this test such buildings as the the Parthenon, the Temple of Neptune at Pæstum, the Campanile at Florence, Amiens Cathedral, or the choir of Westminster Abbey, and you will find that all possess these qualities, and all of them kindle undying enthusiasm. Once learn to see that such qualities exist and produce their effect, and you have made one step at least towards possessing them yourselves. Nor is it necessary that you should have any hope of exhibiting your qualities on buildings of such importance as those just mentioned. Recollect that in Athens, in Italy, in France, and in England small works have been at least as interesting and perfect as large ones, and that no artist depends upon the largeness of the work given to him to do for the opportunity of showing his real worth. I recollect when I sat in your place hearing one of the greatest of my predecessors—the illustrious Cockerell—declare that the most perfect thing he had ever designed was a scraper; and, strange as the illustration is, he was serious, and justified in being serious in such a view. It may be argued that in ancient times there was an intuitive rather than a conscious recognition of the need for refinement which I assume to be necessary; but this I am inclined to doubt. What, for instance, is the story of the long and slow development of Doric architecture, but one of an attempt to secure more refinement by the gradual perfection of every detail?—the enthusiasm for what had gone before being the stimulus to greater perfection, and the refinement being the consequence of the enthusiasm. Or, again, in the whole history of art, is there a more interesting chapter than that of the gradual development, by repeated changes and modifications, of the circular Roman and Byzantine buildings, through the Romanesque apse into the intricate and beautiful complete Gothic chevet of the French churches?—a development which was gradual only in the sense that we can trace all the steps by which it proceeded, but which, as compared with the slow and patient development of Egyptian and Greek art, astonishes us by the rapidity of its proceedings, the fertility of imagination shown by those who conducted it, and the vast and complete change in all architectural forms which in a few years was achieved. Some among you may have no enthusiasm for your art, and may have no interest in such evidence of what the architects of old must have felt. You may have been told to be architects, not because you refused to be anything else, but because the profession seems to offer a fair mode of getting a living. This is to reduce your art to the level of the basest trade, to deprive yourselves of all chance of real success, and to condemn yourselves to a career of mediocrity which will benefit neither you nor your neighbours. If there are any such students here let me beseech them to take a new view of their duty, and to cultivate, by every means in their power, the frame of mind I have been describing. It does not lie in the power of everyone to become a great artist. But it is in the power of even the least gifted among you, by cultivating his reverence for the ways and work of great artists, to make it impossible that he should ever be guilty of anything wholly bad and contemptible. Consider what a glorious inheritance you have! In every part of the civilised world, the architect whose eyes are open finds, on all sides, works which speak more forcibly, the more he examines them, the great and eternal lessons of his art. He, above all men, has a delight in the past, because he can read better than others the most permanent and intelligible of its visible records. If he is wise he never ceases to learn, for the examples he has to study are of inexhaustible number and variety. Even if circumstances compel him to limit his studies to his own country, there is no cause for regret; for I suppose the man has not yet lived who has seen all that is worth seeing, even of English architecture; and as much may often be learnt by the patient study of small works as by more ambitious attempts to study, to group, and to analyse the origin, principles, and developments of the art all over the civilised world. When you have resolved to look at your work in this spirit, you must be reminded that there are some minor conditions of success which I do not think beneath notice here. Your first business is to become an accomplished draughtsman. As you will hear presently, good architects have existed, and may always exist, who do not draw well; but no one can safely say to himself that he will elect to be numbered among them. Architectural draughtsmanship is a good training for everyone, because its first essentials are clearness and accuracy; and the man has to depend very much for his knowledge of the effect his work will produce—must learn so to represent it on paper as to insure that his drawing is a fair representation of its effect. The habit of tinting and shading architectural elevations is a bad one, and not to be encouraged. It is a simple waste of time. In outlining geometrical drawings, as well as in sketching, never use a very hard pencil, and make up your mind in the latter to dispense almost, if not altogether, with indiarubber. The essence of good architectural drawing is not only that it should be clear and accurate, but that it should be done positively and once for all. Nothing is more fatal than a slovenly and tentative habit in architectural draughtsmanship, and if you indulge in it you will find it stand much in your way when you attempt to make original designs. When you draw these, the first thing that you must endeavour to accomplish is to acquire the habit of seeing in your mind what you want to draw before you draw it. To see some men draw one might almost suppose that the pencil was gifted with the miraculous power of making a design, so little does it seem to be certainly guided by the hand that holds it. The habit of picturing your design to yourself before you draw it would save a great deal of this confused sort of work. Knowing what your intention is, you have then only to put it on paper; but if you have not taken this preliminary trouble, you will never work with half the accuracy or speed which would otherwise be possible. Good draughtsmanship is a necessity in these days for a really accomplished architect. It is impossible in this respect to put ourselves exactly in the position of men who had not our facilities and our system of education. It is true we are not better artists than they were; but in one sense we can draw better, and are, therefore, bound to do so. I am not aware that any one knows how a Greek architect set out his design. And as to the Mediæval draughtsman, we know, by such books as that of Wilars de Honicourt, a 13th-century French architect, that an architect's drawings then were something like children's drawings now. And even at a later date the still extant original drawings for such works as the front of the church at Louvain, the Steeple of Ulm, and the Cathedral at Köln were strangely unlike the exact geometrical drawings which we are able to make. These drawings—published in Moller's "Denkmaler" and Hollar's drawing of the Steeple at Mechlin, engraved, no doubt, from an original drawing, affords interesting illustrations of this kind of elevation. You will find that though they are in elevation, they are frequently so far put into perspective as to exhibit at all points the plan or horizontal section of the work. Both the drawing of elevation and plan are, however, so slight, that it must have been impossible for any architect to have satisfied himself without further details, and these, there is some evidence to show, were set out by the architect himself at large on a floor specially provided for the purpose. Such a floor exists in the work-room over the passage to the Chapter-house at York, and at Limoges the original setting-out of the groining was found by M. Verneille in a similar position. Possibly also, models were more used than they are now. At Louvain is still preserved a most exquisite model, cut in stone, of the complete design for the west front of a church, which itself has never been completed. When compared with the design, which is also preserved, it is seen that the model represents mouldings and traceries with an exact accuracy

which is not attempted in the drawing. But the making of a model by an old architect, in place of a careful geometrical drawing, is no excuse to any one for making careless drawings in the first place now. They are sure to lead to careless details afterwards. Too many of you come here wholly ignorant of all works on your art. Many of them, to which it is always easy to gain access, will give you more evidence of the best kind of architectual drawing than any verbal hints can. But you will find that in these there are united clearness, accuracy, feeling for detail, delicacy, and conformity of line, and you will find no backlining to mark the supposed shaded side of projections, and none of those provoking splotches of black which are unhappily so much in favour with some young draughtsmen. A power of drawing in perspective is of the first importance on two grounds: first, that without this knowledge your enjoyment and success in sketching will be very small; and, secondly, because it will render it more easy to you to realise the effects of your building in perspective, without having the trouble of making a careful drawing or a model, to convince yourself of its real appearance. Without this power you will hardly be able to realise the real light and shade of a design; and without this ability it were better never to attempt to make a design at all! The delicacy of draughtsmanship on which I have insisted will lead to refinement in other ways. An essentially vulgar drawing may be made of a refined building; it should be your aim to let the drawing itself have that air of refinement also. You are, all of you, armed with mathematical instruments the like of which no age before our own has ever seen. Remember that these are useful servants and no more, and that whenever you can do so, you had far better use your hand in place of your instrument. You cannot practise this too much or too steadily. Draw accurately, firmly, and, as far as may be, with a single stroke, the outline of a Greek or Etruscan vase, the volute of a good Ionic capital, the sections of Greek mouldings, and equally of our own English mouldings of the 13th and 14th centuries. The hand trained in this way is, believe me, a much better servant than the bow pencil. The curves which can be drawn by a trained hand, under the guidance of a trained eye, are far more beautiful because more subtle in their variations and prolongations than those of any instrument; and I insist on this point because, unhappily, the bow pencil, and not the hand, is at the root of almost all the so-called ornament of the nineteenth century. Another habit which it is desirable to encourage is that of representing with a few lines the effect of several. In drawings to a very small scale the attempt to represent every line of moulding and detail is sure to be a failure as well as a waste of time; and the selection of those lines which are essential is always evidence of good draughtsmanship. This cannot be done without a real knowledge of the character of the details. And as no one can draw a building accurately without this knowledge, I need hardly say that it is very far from a waste of time for a painter to give some attention to architectural detail. Some of Turner's pencil-drawings are capital examples of his power of indicating so accurately the details of a building, that no one need be in doubt as to the style in which it is built. He could not have done this unless he had educated himself by the study of architectural detail, and his example ought to be followed by every painter-student who wishes to be able to introduce any architectural features into his pictures—as who does not? One word of caution is necessary here. The power of making good and attractive drawings is of immense value, and may make a vast difference in your prosperity and success in life. But it is a means only, and not the end. It has its dangerous side. It is possible to make a design look well on paper which will never pass muster in execution. Nothing is more suicidal than this; but, unfortunately, there is nothing against which it is more necessary to warn you. If you do devote yourselves to making attractive architectural drawings, do them always, I beg you, with a conscientious determination to represent your work absolutely as it will appear—the real object of working out architectural designs in perspective being the discovery of weak points in the design, so that they may be corrected in execution. When once you are able to draw fairly well, you are prepared for what is the best and widest field of study—the buildings which are the best illustrations of our art. And in these it is well, I need hardly say, to devote yourselves as far as possible only to the best examples. In sketching, it is best at first to err on the side of formality. Draw, above all, clearly and accurately, the ground-plan of every building you visit, for without this, no other sketches are complete, and with it, even slight sketches of the elevations or details are nevertheless intelligible. At the beginning, you can hardly take too many dimensions; your work must be sketched and measured on the spot with equal accuracy. At a later period you will be able to generalise more, and to dispense with this elaborate detail in your studies. In sketching, never make the common mistake of using the commonest paper. Treat yourselves, from the first, to luxury in this one respect. Make your measured sketches in a book, and take care to make your dimensions ample enough to insure the accuracy of the drawing you make from those sketches; but in the case of mouldings, of sculpture, of the filling in of panels or arches, let your sketch be as carefully drawn as possible, and do not depend at all upon your two-foot rules for the accuracy of your sketching. Pay special attention to such points in construction as the jointing of stonework, the design of mouldings meant to meet special wants, as—*e.g.*, the slopes of buttresses, and of other members intended to throw off water, the adaptation of architectural features to their situation, as, for example, the details used near the eye and far from it, and the modes adopted for making them both properly visible, and at the same time strong enough for their place and work. Finally, in whatever style it is that you are most interested, never fail to draw with the utmost care, and to store up in your mind the effect of all the best mouldings you see. There is no part of your studies more important than this. Never believe any one who speaks lightly of the science or art of moulding. (I call it by both terms, because it embraces both.) By no test can you separate good work from bad more surely than by the comparison of the mouldings. A good A good moulding grows out of the necessities of the occasion. It gives us the power of accentuating our lines or proportions in the most positive manner if we choose, or of softening them off so delicately as almost to conceal the transition from one feature to another. Without their aid there is a rudeness—a coarseness, one may almost say—which is offensive whilst with their aid that refinement of line which, as I have told you, it should be your great aim to achieve, is made more perfect, and carried to greater perfection than in any other way. In drawing mouldings, I advise you always to sketch them with as much accuracy as possible, and to a good size, and on no account to depend upon correcting your indifferent sketches by a multitude of dimensions. Your eye, your hand, and you memory will be misled. You will look again and again at your sketches, and will forget all about your dimensions, and so be led to a permanently false impression of their real contour. Remember always that sketches of mouldings alone, without equally accurate sketches of the features to which they belong or with which they are connected, are useless. A well-known book which would otherwise rank as one of the most accurate works on the subject is utterly valueless, owing to an omission of this kind. Arch mouldings are drawn without any plan of the capitals which they support, or of the jambs below the capitals. The relation of one of these to the other is of the very essence of the matter, and unless both are drawn it is really of little use to draw either. In the same way the relation of the mouldings of a window to its tracery, of a column to its capital and base, and of both to the entablature, ought always to be recorded in a sketch. From the drawing of mouldings you will go on to that of sculptured or carved members, and in these it is the effect which was intended to be produced of which you must be thinking. So, for this purpose, I attach but little importance, save as a test of mere draughtsmanship, to the work which you have to do in our schools from casts. All architectural features in which carving is introduced ought to be looked at and drawn in the very place for which they were intended. If a cap look perfectly well hung against a wall, on a level with the eye, it can hardly be suitable for its real position in the building some 50 ft. above the spectator, and a great difference in treatment ought to exist between a piece of carving which is made to appear to do hard service, and another which evidently has no such serious work to do, and is rather the evidence of the artist's pleasure in his work.

(*To be continued.*)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the eighth ordinary meeting of the session, held on Monday evening, the 14th February, John Whichcord, F.S.A., President, in the chair.

The Secretary having read By-law LXXVI., the PRESIDENT announced that, in pursuance of the said by-law, the Council proposed to submit to her Majesty the Queen the name of George Godwin, F.R.S., F.S.A., Past Vice-President, as the Royal gold medallist for the current year.

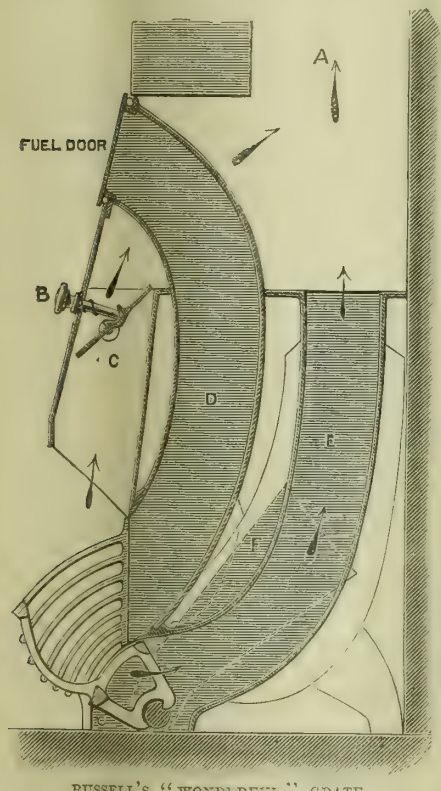
SANITARY SCIENCE IN ITS RELATION TO CIVIL ARCHITECTURE.—WARMING AND VENTILATION.

The discussion, adjourned from the 17th January, of the paper by Mr. Edward C. Robins, F.S.A., was preceded by a description of a system adopted at the City Guilds Technical College, to be erected in Tabernacle-row, E.C., and which resulted from a conference between Mr. E. N. Clifton, Mr. J. L. Bacon, the Professors, and Mr. Robins.

Mr. HENRY DAWSON, having referred to the drainage of buildings, continued the discussion on the subjects of warming and ventilation. He concluded by saying:—I have been particularly struck with the system adopted at the Long Room at the Custom House by Mr. Boyle. I must give my testimony that his air-pump ventilators are really so constructed as to act like air-pumps. They do exhaust the air in the top, and my impression is that they are most useful things, and may be made very valuable for the extraction of foul air from large buildings. To say, however, as is the custom, that there is never any down-draught is saying too much, and when I went up there to examine the system, I found that the outlet-tubes, instead of being as described—carried up straight from the ceiling right up through the roof—have a bend in them, and in that almost horizontal bend is placed a contrivance for the purpose of checking any little down-draught, and there is also a little receptacle for soot. As to the admission of fresh air by vertical tubes, it is made available in large halls, where high enough, no doubt with success. I believe Mr. Robins states that he considers it particularly suited to a room with an open fireplace, and from that opinion I must entirely dissent. I think there can scarcely be anything worse than a room with an open fireplace, into which cold air is admitted by a tube of that sort. I think so for this reason: that my own conviction, scientifically, has been quite confirmed by experience in two instances. At the particular request of clients (against my advice) the system was tried, and in both cases it most ignominiously failed. It failed, as I said it would, from the fact that the cold air—unless the room is at least 20 feet in height—has a rapid upward direction to the ceiling, and is sure to descend again on the heads of the persons in the room, more especially if there is a large open fireplace. When this system of Tobin's was loudly praised, and referred to in the rooms of the Society of Arts, I went there within a few days after, and saw that the system was being tried there by means of open windows. Poor Mr. Le Neve Foster was then there, and I said to him, "What do you say about this new means of ventilating your room? What do you think of the ventilators"? "Oh"! he said, "Confound them all. Ever since these things have been put in, I have had nothing but rheumatism and sciatica." He told me he had moved from one side of the room to the other to escape the current; but it was, he said, impossible to do so. The instances where, by request, I have put it in force, have been attended with the same complaint. Does it not seem palpable that to go and thrust columns of cold air up to the ceiling (of course with the view of purifying the atmosphere of the room) is a course that is unscientific and altogether bad, especially when you reflect that this air is brought down to the level of the lungs, to be breathed by persons who have already expired it. Therefore, I look upon it as a most imperfect system

anywhere. In very large halls, and even in churches, sometimes it may be introduced with impunity or no great harm; but I do submit that the more natural system of bringing in the fresh air at the bottom and carrying it over such a heating medium as hot-water pipes is a far more scientific, natural, and healthy plan. With regard to the Custom House, I found that the tubes (about 6ft. from the floor) were covered over with ledgers. I asked them why this was. "Because we feel a draught," was the reply.

Mr. J. P. SEDDON said that architects could not but rejoice at the sanitary crusade now in progress, trusting that some good might result from it to the community. He welcomed the interest recently shown in the matter by the members of the medical profession, as the public would listen to them, though long deaf to architects, who had piped much longer in the same strain. He wondered whether such learned gentlemen would be surprised to hear that a discussion upon the practical ventilation of buildings was held in this room of the Institute of Architects in the year 1863. A glance at the remarks then made would show that architects were even then alive to the grave importance of



RUSSELL'S "WONDERFUL" GRATE.

A, common flue to up and down-draught.
B, valve to shut off up-draught.
C, up-draught.
D, fuel chamber.
E, smoke-flue for down-draught.
F, counter-balance weight to front bars.

the subject. The speaker, having referred briefly to questions of drainage, afterwards quoted some remarks he had made during that same discussion, which took place several years previous to Mr. Tobin's alleged discovery. Mr. Seddon concluded by referring in laudatory terms to "The Wonderful Grate," the very existence of which, he said, had been doubted by his friend, Mr. William Burges, A.R.A.; and he begged leave to show a model of it lent to him for the purpose by its inventor, Mr. Samuel Russell.

Mr. SAMUEL RUSSELL, having been called on by the President, enumerated the special properties of his grate to be, that it burnt throughout the day and night without attention; that the quantity of fire might be regulated at pleasure; that the intensity of fire might be regulated at pleasure; that when set to any desired quantity and intensity it would continue to burn with but slight variation; that it consumed nearly all its smoke; that the fire was always bright and clear, no black coal being seen; that it was very clean when in use and required no fire-irons; that it gave a large supply of pure warm air; that it burnt anthracite coal, coke, or cinders, or any combination of these; that the chimney-flue did not require sweeping oftener than once in four or five years; that the cost of fuel for it was one penny for six hours; that no coal-box was required in the room. Mr. Russell continued as follows:—For the accomplishment of these purposes the grate is provided with two flues, one passing upwards in the ordinary way from above the fire, the other commencing below the fire and passing up behind it, the two communicating at any convenient point above the fire. At the junction of these two flues a valve is formed capable of being regulated so as to divert the draught in either direction. When the valve is open, leaving a free upper draught, the fire is very mild, and in proportion as it is closed the fire increases in intensity, and produces almost a white heat when quite closed. Thus any fire desired may be obtained by simply turning the knob which regulates the valve. Another portion of this invention consists of a vertical tube or chamber for containing the fuel, the lower end of which opens into the back of the grate. It is charged from the upper end, which is then closed air-tight. The fuel by the action of its own gravity continues to supply the consumption of the fire. The double flue and valve, as already stated, regulate the intensity of the fire. To regulate the quantity the front bars are made to draw forward with a counterbalance weight always tending to draw them back, with a catch to fix them in any desired position. When the catch is removed, the backward pressure stops the fall of fuel, the fire becomes gradually less, and is finally extinguished. By this arrangement a small quantity of fire may be kept burning throughout the night, the bars in the morning being drawn forward, and a scuttle of coal supplied starts it afresh for the next four and twenty hours. As the fuel enters at the back the smoke is evolved from it before reaching the fire, and whether the up or down-draught, or both, are in force, it is consumed, the only escape for it being through the fire. The recess in which the grate stands forms a hot-air chamber through which the external air, or where this is not practicable, the air of the room, passes.*

Professor Ayrton, Mr. Wm. White, F.S.A., and Mr. E. Spencer Rolfe having spoken, Mr. E. C. ROBINS, F.S.A., replied on the whole discussion, and a vote of thanks was awarded to him for his paper.

THE CONSUMPTIVE HOSPITAL, HAMPSTEAD.

THE second Saturday afternoon "visit" for the present session of the Architectural Association took place on the 12th inst., when a large number of members met at the North London Hospital for consumptive patients, at Mount Vernon, Hampstead. The building occupies a triangular site on a hill-top, with roads on two sides, the chief frontage being towards Branch-hill-road. The entire scheme will provide accommodation for 100 patients, but at present only the first third of the hospital has been erected, and this section is almost finished structurally. The architect is Mr. T. Roger Smith, F.R.I.B.A., whose design was selected in open competition three years since, and was illustrated by two elevations and two key-plans in the BUILDING NEWS, December 19, 1879. Mr. Smith met the visitors at the hospital and explained the working drawings, giving full explanations as to the principles and details of construction. The style of the building is Early French Renaissance, of a chateau type, with a high-pitched pyramidal roof, pedimented dormers, square-headed windows, and circular angle turrets; on the garden front of the principal floors is a covered verandah carried on cantilevers. The facing materials are red brick and stone dressings, with red roofing tiles. On plan, the hospital is an isolated parallelogram with projecting angle turrets, the long sides of hospital ranging north and south. It consists of four principal stories and an attic. On each floor is a wide central corridor running from end to end, and placed slightly to the north of medial line, so as to give the larger rooms the southern front. The basement is utilised as out-patients' departments, household stores, and similar purposes. The ground floor is devoted to administration, a board-room, committee-room, and day-room, resident medical officer's and physicians' rooms. The first and second floors are identical, the former being for female, and the latter for male patients. In each is a large day-room, and a series of wards for six, four, and two beds, the present accommodation being for between 40 and 50 patients. On the south side all the windows open with French casements into the arcade or verandah already alluded to; and the south-west angle turret forms a circular nook, 8ft. 6in. in clear, added to that ward. The north-west angle turret is occupied by the water-closets, practically shut off from the main building by a cross-current from windows at inner angles of turret. The kitchen and its dependencies, the servants' bedrooms, and those of some of the nurses, are placed in the attic, following the modern hotel practice, so that the smell of cooking cannot penetrate into the wards. At the eastern or unfinished end of the section already built is a well-stair, and also a manual lift; the grand staircase, principal entrance, boardroom, &c., are to be provided at a future day in the central block. The corridor which forms the main feature on each floor, is lighted and ventilated from the lantern over well of stairs and also by borrowed light from the wards; it is built fireproof in brick arches, carried on iron joists, and Mr. Roger Smith remarked that he had found this cheaper in execution than any of the estimates procured from patentees of special floors. The external walls, where exposed to wind, have been built hollow. An effort has been made to render thoroughly secure the steep-pitched roof; the main braces are carried from corner to corner, so that the principal rafters are hips; collars are thrown across above the ceiling, and an iron is carried over to act as a tie-beam; and in addition to these measures, all walls have been built up into the roof. In the basement some of the rooms are divided only by iron columns, with wooden partitions between, so that, if needed, a large board or meeting-room could be provided. Some trouble was experienced with the foundation, which is on loam, but a greater difficulty was, that, owing to the high elevation, the pressure of water only reached to the second floor; here, therefore, the chief cisterns are situated, a hand-pump and small cistern being fixed for supply of kitchen. The stories are each 14ft. 6in. high, and the cubic space per bed varies from 1,000ft. to 1,200ft. The lower part of windows are filled with large sheets of plate-glass between the mullions, and the upper portions with squares of moderate size. The corridor and staircase are warmed by hot-water apparatus, but each room is warmed by its own open fireplace. In front of the terra-cotta flue an air-space has been left opening into the room near the ceiling, so as to provide additional ventilation when the fire is lit, and vertical tubes are introduced in each room. The flues are made as straight as possible; circular, in terra-cotta, with rough surface, and openings are provided in the basement, so that they can be swept without disturbing the patients. The fireplaces are lined with Minton's tiles, and have basket grates set in shallow semioctagonal recesses; the chimney-pieces are of a green marble, recently introduced by Messrs. Blackmore and Nixson, of Stonehouse, Dent, Yorks, and have an effective appearance; the mantels are very narrow, and of deal, painted. The dado of walls, and the walls of corridor and staircase, are finished in Martin's cement, and the corridor has been laid on each floor with an ornamental border of encaustic tiles by Messrs. Craven, Dunnill and Co., of Jackfield, Salop. The closet fittings have been supplied by Messrs. Doulton, of Lambeth, and the soil-pipes are carried up open into the roof, well above the dormer openings. The future extension of the building has been kept in sight throughout, so as to reduce the amount of reconstruction of existing work to the lowest point. The contractors for the portion now in hand are Messrs. Higgs and Hill, of Crown Works, Lambeth, and their foreman on the works is Mr. H. Unicume; the amount of contract is about £10,000.

* Messrs. Archibald, Smith, and Stevens, of 48, Leicester-square, have since sent us the following note with regard to the stove.—ED. B. N. "Saturday, Feb. 12. Fuel chamber filled at 6.30 a.m. Office closed at 1.30 p.m., opened again Monday, Feb 14, at 6.30 a.m., when fuel chamber was found empty, but fire still burning in grate."

The town-council of Godmanchester, last week, elected Mr. William Baxter of that town as borough surveyor. For the appointment, the salary attached to which is only £52 per annum, there were, as usual, a large number of applicants.

FITZJOHN TOWER, HAMPSTEAD. — ST. MARY ABBOTTS CHURCH, KENSINGTON.—ROYAL ACADEMY COMPETITION.—DESIGN FOR A COLLEGE FOR FORTY STUDENTS.—ANGLE FIREPLACE AT RAWDON, HERTS.

OUR LITHOGRAPHIC ILLUSTRATIONS.

FITZJOHN TOWER, HAMPSTEAD.

THIS house is now being completed, from the designs of Mr. John Th mas Wimperis, of 25, Sackville-street, Piccadilly, for Mr. Herbert F. Baxter. A Domestic Mediæval style has been adopted, admitting of much variety of treatment, and is executed in red brick, with black pointing, Portland stone dressing, Broseley tile roofs, ornamental crestings and terminals, with wrought-iron finals to tower, partly gilded. The builder is Mr. William Brass, of Old-street, St. Luke's.

ST. MARY ABBOTTS CHURCH, KENSINGTON.

THIS church has only within the last few months been completed by the erection of the tower and spire but the main portion of the building was commenced about ten years ago. It is one of the largest churches built by Sir Gilbert Scott, and is certainly the most conspicuous as well as satisfactory church from his designs erected in London. A set of working drawings of so important an example of ecclesiastical architecture cannot fail to be of interest, and we have therefore arranged to illustrate the building rather fully, more especially the tower and spire, which were among the last designs prepared by Sir Gilbert Scott before his death. To-day we publish the south elevation and plan, with a detailed elevation of the west front. Other illustrations will follow, when we may be enabled to furnish further particulars of the church. The erection of the tower and spire was carried out under the supervision of Mr. John Oldrid Scott, F.R.I.B.A.

ROYAL ACADEMY COMPETITION—A COLLEGE FOR FORTY STUDENTS.

LAST week we illustrated the selected design in the Competition for the Royal Academy Travelling Studentship, the subject being a college for forty students, and its author was Mr. W. J. N. Millard. To-day we publish the perspective view of the design reckoned second in merit in the same competition. Mr. A. H. Tiltman is the author.

ANGLE FIREPLACE IN OAK ROOM, RAWDEN HOUSE, HERTS. DATE 1622.

THE original of this drawing was exhibited at last year's Exhibition of the Royal Academy; it was finished in sepia, with washes of the same colour. The work is thoroughly characteristic of the period, and of considerable interest, though its quaint symbolism is rather obscure. The figures in the frieze, however, clearly represent the Continents of Europe, Asia, Africa, and America, with the animals, &c., peculiar to each. The stonework is white in colour, and has a charming effect in conjunction with the dark hue of the oak panelling round the room; the framing of the latter, as may be noted, is of very irregular widths.

OXIDATION OF BUILDING MATERIALS.

NEARLY all our building materials suffer largely from the effects of oxidation, the chief causes of this destructive action being moisture accelerated by acids and contact. In the case of metals, it has been pointed out that humidity in the air and in running water act by the formation of the hydrous oxide in proportion to the purity of the metal, and hence wrought iron is more rapidly affected than steel, and steel than cast iron. It is well-known that cast iron has an outer skin, which is much less subject to rust, and, on this account, it is best suited for all exposed constructions, though, even in these situations, the metal should be protected or coated. Cast iron, cast in sand, is more readily oxidised than when it is cast in loam, especially when exposed to galvanic action, and this has been accounted for by the greater smoothness of surface of loam castings. When iron has to be galvanised, the loam casting is decidedly preferable. It is needless to dwell on the importance of protecting wrought iron, and thin plates of it should never be exposed to the atmosphere without protection. Recent experiments have not yet furnished us with any ready and permanent preservative coating for iron, and coatings of zinc or asphalte appear to be the only resources which can be relied upon to arrest decay in iron exposed to moisture or sea water. Crystalline wrought iron is more subject to chemical action than the fibrous and amorphous kind of texture, and according to Mr. G. R. Burnell "the old Swedish iron and the charcoal iron, formerly used for iron railings in the metropolis, has yielded to the effects of the galvanic action of the atmosphere in a manner very different from the wrought iron made at present; which latter, being made from coal, is much more fibrous in texture."

It may be unnecessary to review the numerous patents and preservative processes that have been brought out and tried, and have been given up as inadequate to cope with the destructive action of the atmosphere upon ironwork. Good coatings of boiled oil are recommended for all malleable iron whilst it is hot, and for castings after they have been cleansed. Paints of oxides of lead and iron serve their purpose; but it would be dangerous to trust to their protection for any length of time, and in the case of paints prepared from lead bases, a chemical action is set up between the surfaces; and we should rather be inclined to prefer the application of a coating of gas-tar or asphalte, known as Dr. Angus Smith's patent. Iron coated with this application is found to stand the atmosphere for a number of years longer than any other coating, and the mineral bitumen resists the action of acids and all iron exposed to fumes. Coating the iron with a preparation of pulverised glass with bronze, or copper, also of lead, have been tried with more or less success; but the difficulty is to apply such processes to large standing structures like bridges. Few of our readers have not heard the more recent treatment of iron on the Barff system, by which the articles are subjected to superheated steam at a very high temperature. We often wonder how long some of our iron railway bridges will stand the gradual deterioration and loss of substance they are being yearly subjected to. The steam from locomotive engines upon the iron roofs of many of our railway stations is another instance of rapid deterioration going on, and it may be worth the attention of our engineers to consider the expenditure necessary to keep such roofs in efficient order. The contact of lead and iron is well known to set up a chemical action destructive to iron-work embedded in stone, and the acid in oak is found to act injuriously on iron, as illustrated by the decay caused by iron nails in wooden ships. Much structural injury is due to the combination of iron and stone. The rusting of wrought iron cramps is a common instance due to certain salts of lime, but old cramps and ties closely embedded in mortar, which excluded the air, have been found in a perfect state of preservation. We may recommend Portland cement, as the most judicious fixing for iron in stonework.

The effects of oxidation on stonework are no less apparent in what is known as weathering, and there are but a very few stones—such as the very compact sandstones, and the crystalline magnesian limestones—which are capable of resisting moisture. Of course, stones containing a large proportion of carbonate of lime must quickly suffer from oxidation, especially when exposed to alternate rains and frosts, to damp atmosphere and driving winds, and when their textures are more or less absorbent..

SMOKY CHIMNEYS.

AT this season many are the complaints that reach us of incurable smoke-nuisance in houses, the remedy for which is often within the reach of the tenant or occupier. The usual idea is to place a chimney cowl or some curiously-shaped pot on the top, which may, or may not, effect a cure. Bricklayers are appealed to for a remedy, and they generally suggest the latter as an expeditious mode of getting over the difficulty; the chimney is again tried and the smoke goes up, the occupier rejoicing in the thought that the nuisance is at last abated. But another day comes when the wind may be in a different quarter: the same evil is experienced, and what was thought to be a cure turns out to be at best an expedient that will only answer under certain states of the atmosphere. A speedy remedy involving less cost and trouble will generally be found available. In nine cases out of ten the fault is in the lower part of the flue, the "throat," as it is technically called, this part being so large that the cold air interferes with the passage of the warm smoke. All that is needed is to contract the throat just above the fireplace, which may be done easily by introducing a sloped slate, or forming with tiles and cement a kind of projecting corbel on one side or the back. If this is performed carefully the happy medium is produced, and the smoke, having no cold current to impede its passage upwards, escapes. In building houses, the throat of a flue ought always to be reduced at a certain angle, neither too slowly or too quickly, to the required area of the flue above, and if this point be attended to, the chimney will draw without the inconvenience of having to open doors and windows. A valve to open or close above the fire-grate, provided in some stoves, will generally be found to answer if fitted to fire-places with large throats, but of course this entails the expense of a new grate. It is possible, however, to have a regulating valve to all fire-flues, so that it may be opened or closed at pleasure. Not only might the grievance of smoke be abated by this simple means, but the draught could be regulated to a nicety, and the consequent consumption of fuel, and the discharge of Stygian smoke into our atmosphere be greatly lessened. We venture to think if the Smoke Abatement Committee would turn their attention to the evil of large, gaping chimney mouths, and pass a regulation limiting the size of the throats of our domestic fireplaces, they would be dealing practically with the grievances they are trying to remove.

PARLIAMENTARY NOTES.

NEW COURTS OF JUSTICE.—In answer to Mr. Firth and Mr. McLaren, Mr. S. Lefevre said on Tuesday: I have every reason to believe that the new Courts of Justice will be ready for the occupation of the Judges in Easter, 1882. The clock will be placed in the tower in the course of the present year, and I hope it will be seen both day and night.

MUSEUM OF NATURAL HISTORY.—Mr. S. Lefevre, in reply to Sir C. Reed, said on Tuesday: The Botanical and Mineralogical Collections have already been removed from the British Museum to the Museum of Natural History at South Kensington, which, I believe, will be open to the public on the next Bank Holiday—namely, on Easter Monday.

Mr. J. Whittaker, architect and surveyor, was killed on Monday week by an accidental fall from a train near Hindley-station on the Lancashire and Yorkshire Railway. At the inquest it was proved that deceased had been to Wigan on business and went to sleep in the train. Waking up suddenly, he opened the carriage-door on the off-side and fell out, and was mutilated by a passing train. A verdict of accidental death was returned.

Messrs. Chubb and Son, lock and safe makers to the Queen and to the Bank of England, have just issued a new illustrated priced catalogue. It has been compiled by one of the firm. It consists of 28 pages; contains nearly 150 illustrations; the prices of 700 different articles; and no less than 1,100 dimensions of locks, safes, &c. It is stated that nearly *one million* of the patent detector locks have been made and sold.

THE PRESENT CONDITION OF THE ART OF WOOD-CARVING IN ENGLAND.*

(*Concluded from page* 163.)

LET us turn to a later fashion, that so popular now under the name of Queen Anne. Numerous examples of the woodwork designed by the architects and carvers of the 17th and 18th centuries remain in public buildings, churches, and dwelling-houses. They had fewer decorative resources than their contemporaries in Italy and France. One great name, however, belongs to the profession of wood sculptors of the century, that of Grinling Gibbons. His foliage, flowers, birds, and other details have the sweep and delicacy of Nature, so far as an approach to Nature can be carried in decorative carving. All the carving of the 17th and 18th centuries may be called architectonic. It was put to the service of interior decoration. Houses were no longer built with the great halls already noticed. Churches, however, and large public halls, such as those of Greenwich Hospital, Kilmainham Hospital, in Dublin, and other places, were often screened off from the doors. Such screens are regular and orderly façades, with arched entrances, surmounted by a pediment. The walls of these structures, and of rooms generally, were divided by columns or pilasters, fluted, and with carved Corinthian capitals. The panelling is no longer of the old sizes, but in very large divisions; one of dado height, with tall panels above. They stand well out, and are enclosed within bold roll mouldings, projecting beyond the surface of the panels. Where these panels are of great size, the mouldings were carved. Wreaths of leaf-work stand out in relief on the architraves, that finish the wall panelling; and that surmount the openings of fireplaces and doorways. These doorways, even inside the rooms, are generally covered by a pediment. The picture frames, that form the upper portion of the chimney fronts, are also surmounted by a pediment. Garlands of leaves or flowers, with bold side brackets, in the form of volutes, over which the foliage falls, or from the eyes of which another scroll of leaf-work springs, form the side decoration of the chimney fronts of the more correct Wren period. There are some special features, out of which the woodfitters and joiners of the last century may be said to have made their decorative work, and these are the very elements we want our woodcutters to have at command to-day. First, figure sculpture. In this country, our wood-carvers have never been strong in this essential matter. Even in Wren's time, and that of his successors, beyond an occasional artist, there does not seem to have been any possibility of commanding the services of carvers educated to this extent. We find heads—of cherubs, women, &c.—occasionally well-modelled and finished. But the contemporary Italian and French wood-cutters could beat us out of the field in this respect. Of foliage, the English carvers were masters. That of Gibbons, was of all kinds—abundant, and yet delicate. Generally, he used lime-wood; and his work naturally found its place as an addition to actual architectural details, and was applied to friezes, or placed under pediments, or on the architrave fronts of chimney pieces. In architectural carving of this period generally, the acanthus leaf and the vine are the only ones employed. There is, also, the honeysuckle ornament, and anthemion, or leaf arrangements similarly composed. In later work—Adam's, for instance—the olive, or a leaf of similar shape, was added. Speaking generally, however, the leaf used is the acanthus. It is cut on capitals and under brackets. Portions are composed over the surfaces of mouldings, in a hundred varieties, and with endless inventiveness. Yet it is always recognisable, and helps to preserve the unity of the general design of the decoration. On the furniture of Queen Anne's time you see the acanthus leaf on the bulging legs of chairs and tables; and broken pieces of it on the tops of bed testers, on chimney pieces, and round looking-glass frames. The finer, more wiry work of Adam, and the Chippendale furniture, is decorated with sprigs, or portions of this leafage. And some small Adam mouldings are entirely worked in tiny acanthus, even when the width scarcely reaches three-eighths of an inch. The decoration of wood edges or mouldings takes so large a place in the arrangement of panelling, of picture-frames, of fire-place openings, doorways, and so on, that it forms the most noticeable decorative feature at the command of the carver. It is worth observing how few the mouldings of these periods are. They are derived from classic Rome. There is the egg and tongue; leaf mouldings, billet mouldings, made up of small square dies separated by hollows; bead mouldings; ribbon mouldings (guilloches); square key frets; the Vitruvian scroll; little else. Yet few as these are, the shades of variety to which they lend themselves are endless; partly by the size, partly by the shape of the egg and the anchor, or by carving the egg surfaces, or by various treatment of the acanthus leaf-work, where it covers the surface of the moulding lines. The carvers of the last century cut these in soft pine, over long lengths of moulding; often in beautiful curves and turns of the leaf. A slip of the chisel would have destroyed the side of the doorway. There are examples in the Kensington Museum, taken from old London houses, quite complete, and of masterly execution. Could we be sure of getting such sharp, free-handed work done now? Then as to furniture. Chambers introduced Chinese fret-work, and the Chippendale; cut those delicate pierced cabinet tops, and china shelves, and table edges, which are so highly prized now. The carving of looking-glass frames took the form of little Chinese gardens, with rocks, grottoes, argus pheasants, and other curiosities down the edges. As far as architectural carving was concerned, how very few and simple are the elements of this old work. It is of a kind which all carvers could learn; which will always return full and redundant measure of effect and agreeableness for the modest skill it requires. Some London firms well understand this kind of carving; but only two or three establishments. Putty, or papiermaché, or other moulded imitation, are generally provided by the builder. Look at our picture frames, and the feeble meanderings of putty over their surfaces, and compare them with the simple, honest mouldings of the Vandyck frames. I do not forget the admirable objects we have seen at various International Exhibitions. But these are the results of special and extraordinary exertion of artists, and are monumental—not works that can be placed within the reach of ordinary buyers, or made without excessive cost of time and labour.

In conclusion, we are brought to one or two observations of importance. First, all decorative carving in wood, Mediæval and Renaissance, has been intimately connected with architecture; and, further, has been architectonic in design and details. The tabernacles, pinnacles, and spires of Mediæval stall-work, triptychs, and so on, are designed on the lines of external architecture. So with door pediments—really small roofs—pillars, capitals, architraves, and so on. How is it that wood, so different a material from stone, and being used indoors under such different conditions from those that govern exteriors, should fall under the rules and lines of actual architecture? Ought not all woodwork to be governed by some distinct principle of decoration? Most designers have asked themselves this question, and battered their brains for an answer. The honest endeavours of many architects and cabinet-makers show that an answer has been sought, and the general results show how rarely it has been found. Sooner or later we must all come round to the principle which has prevailed so generally, if not so universally, in the past. Good art maintains its unity. Architecture is the master art. Sculpture and painting find their true places under its shadow. This architectonic character is one of analogy. Wood carving should be suggestive, not imitative, of architecture. It is on a lighter and a broader scale of proportions, in accordance with the continuity of fibre and tenacity of grain of wood as contrasted with stone. Another observation I make is on the extreme simplicity of the elements out of which such endless varities, both before and since the Renaissance, having been produced in carving—one or two kinds of foliage, half a dozen types of moulded edges. Some of these are convex in sections, some concave, some undulating. One of the most dangerous stumbling-blocks to modern carvers, men who have not well read or thought the subject out, is the vast variety of fragmentary examples in museums. They belong to various periods, and represent many phases of change. The student aims at producing something new. In art, novelty—actual novelty—is rarely to be had. The traditions of art, descending through the long ages of the past, reveal to us the unity of principle which they maintain, not less than the simplicity of the instruments, by means of which successes so many and so various have been achieved. All the great Mediæval and Renaissance architects were students of nature as keen and true as ourselves, but they sought variety rather than novelty, in perpetual freshness of application, of few but inexhaustible principles. What they did, sculptors and carvers, decorative carvers, can do in their degree in our days. If to narrow our field is in reality to increase our insight and inventive powers, it follows that modesty, self-restraint, and simplicity of aim should govern our designs of ornamental carving. Look at the decorative carved work, such as one sees, for instance, on sideboards. Some of these compositions are skilfully carried out; but the impression they produce is that of redundance, crowding, want of discrimination, absence of effect, good work often wasted. To compose really well, to know exactly where to stop, and how to make a simple piece of foliage or figure set off the space it fills—to possess what we mean by a correct taste, is partly a gift, partly the fruits of thought and observation. To pick and choose, and mingle together in the search of novelty and variety, is the least likely way to acquire it. If the desire to put too many ornaments is the danger of composition in carving, so to try to follow nature too far is the danger in execution. No leaf, or flower, or other object followed up to realisation, really decorates the freize or the wood-work on which it is carved; it is better to carve it complete, and lay it on a table, or in a cabinet. When we decorate a frieze, or a cabinet, the ornaments are to be portions of the thing decorated, and worked out, some more, some less, according to the size, shape, amount of plain surface, and so on. Leaves die into the surface, or are only indicated over many places, on the bell of a capital, the tympanum of a pediment. Points in the leaf are here and there fully developed. Figures in bas-relief are often of extreme flatness, or partly flat and partly brought fully out and undercut. Much foliage that would be excellent if indicated only, one sees absolutely spoilt by attempts to elaborate petals, leaves, tendrils, and so on. Even natural proportions have frequently to be modified. Opportunities of careful rendering of nature are never wanting to the carver, and his finer skill and deeper knowledge produce their true effect, when he knows how to keep other portions of his work subdued, or but partially defined, and strictly subordinate to architectural requirements.

* A paper read by J. Hungerford Pollen, before the Society of Arts, on Wednesday, Feb. 9th.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—An ordinary meeting was held on Tuesday evening, the 1st inst., at the Rooms, Queen's College, under the presidency of Mr. R. B. Morgan, chairman of the Association. A vote of thanks was accorded to Mr. J. A. Cossins for his kindness in conducting the party on the occasion of the recent visit to the New Science College in Edmund-street. A paper entitled "Some Ideas on the Practical Ventilation of Public and Private Buildings," of which we published an abstract last week, was read by Mr. William Henman. A discussion followed the reading of the paper, after which a hearty vote of thanks was passed to Mr. Henman for his contribution. An ordinary meeting was held on Tuesday evening last (the 15th) at the rooms of the Association, Queen's College. The President, Mr. George Ingall, was in the chair. After the business a paper entitled "Art Workmen—Past and Present," was read by Mr. John Roddis. The paper, which by the courtesy of the author we shall reproduce in a future number, was exceedingly interesting, and at its close, a hearty vote of thanks was accorded to Mr. Roddis.

British Archæological Association.—The fifth meeting of the session was held on the 2nd inst., Mr. Thos. Morgan, F.S.A., in the chair. The discovery of a portion of a Roman sepulchral slab at South Shields was reported by Mr. R. Blair. It represents a mounted pediment, with heads in high relief, and is similar in workmanship to the celebrated slab with the Palmyrene inscription found in the same locality, the site of the cemetery of the Roman

station. Mr. de Gray Birch, F.R.S.L., read a description by Admiral Wood of another tomb at Yllora, Spain, on the estate of the Duke of Wellington, and of a massive gold ring, with a dolphin cut on a blue stone, found in a large coffin at the same place. Miss Brocklehurst and Miss Booth sent for exhibition a series of drawings of the New Grange tumulus, showing the peculiar incised patterns on the internal stones forming the chamber and its approaches. Mr. G. R. Wright, F.S.A., described a memorial stone, supposed to be of a chieftain of the Arthurian period. The slab was found at Yarrow, and a cast of it is in the museum of the Society of Antiquaries, of Scotland. Miss Russel, of Ashistiel, sent a photograph of this curious memorial. Mr. Loftus Brock, F.S.A., communicated the discovery of Roman architectural work, on the site of a bastion of London Wall recently met with in Houndsditch. These consist of a well-wrought base of a column, and part of the shaft of a diapered column of blue stone. Mr. Watkins produced elaborate drawings of the Roman City Wall, Houndsditch, recently discovered and removed for a length of about 70ft. The walling, which was 8ft. thick, was faced with squared stone, with bands of red tiles and a chamfered plinth of dark ironstone, and of great strength and regularity. Mr. Grover, F.S.A., described a recent and remarkable find of Roman remains on the premises of Messrs. Tyler, Warwick-square, Newgate-street. These consist of three large cylinders of lead, each containing an elegantly shaped glass vessel. Coins of Claudius and Nero were also found, and indicated the early date of the remains. The first paper was by Mr. Butcher, of Devizes—description of the progress of the exploration of the Roman villa at Bromham, made by Dr. Cunnington and himself. The second paper was by Dr. Phené, F.S.A., on some recent excavations made in the Mounds of the Troad. The results were reported by the lecturer in detail.

COMPETITIONS.

BURTON-ON-TRENT MARKET HALL.—The premiums for the above have been awarded as under, viz.:—1st, of 60 guineas to Messrs. Dixon, of Moxon, Barnsley; 2nd, 25 guineas to Messrs. Roper and Browning, Manchester. Mr. Evans (Evans and Jolly), Nottingham, was called in by the council to report and adjudicate on the plans.

CRIEFF NEW CHURCH.—A correspondence has appeared in the Dundee journals as to this competition. In 1878 the Kirk Session of Crieff advertised for designs for a new parish-church, and ultimately awarded the premium to one of the designs submitted by Mr. James M. McLaren, of King William-street, Strand, London, who subsequently produced estimates, showing that it could be carried out for the stipulated sum. The work has not been carried out, and Mr. McLaren asserts that this delay has arisen because a certain influential member whom he names has striven to get his brother-in-law, Mr. George Ewing, a local architect, appointed. To this letter Mr. Ewing has replied, stating that Mr. McLaren gained the premium by submitting a set of old plans, originally prepared in competition for a church at Arbroath, and that he had, therefore, been well paid for his trouble in receiving the first premium at Crieff. Mr. McLaren, in a further letter, admits that he sent in plans designed for a site at Arbroath, but says these were alternative only to a set specially prepared for the Crieff competition, and again complains of the obstructions raised by Mr. Ewing's relative.

ROCHDALE NEW BOARD-SCHOOL.—The competition for the proposed new board-school in Rochdale, on the Harelands estate, fronting Derby-street, was concluded last week. The School Board offered premiums for the best designs, for schools to accommodate 500 children at a cost not exceeding £10 per scholar. There were 38 competitive designs sent in, and from these the Board have selected two. The design which has secured the first premium, and which is to be adopted for the school, is that marked "Utility," and is by Messrs. Maugnall and Littlewood, of Manchester. The plan which has secured the second premium of £10 is by Messrs Holtom and Connon, of Dewsbury.

WOODFORD, ESSEX.—In a limited competition for a new church to be erected at Woodford, the design of Mr. James Fowler, F.R.I.B.A., and Mayor of Louth, has been selected. Mr. Ewan Christian was the referee who made the award.

Building Intelligence.

BRENTWOOD.—The memorial-stone of the parish-church of St. Thomas the Martyr was laid on Monday. The church is from the designs of Mr. E. C. Lee, F.R.I.B.A., President of the Architectural Association, and which were illustrated by a perspective in the BUILDING NEWS for July 25, 1879. It will replace, on the same site, a mean and inadequate brick edifice built in 1835; but the present chancel, which was rebuilt more recently from the designs of Mr. Joseph Clarke, F.S.A., will be retained. The new nave will be 19ft. wide, with north and south aisles, each 17ft. wide, and all 100ft. in length, and there is proposed to be a west tower, 19ft. square, finished with a spire. The nave will be 42ft. high, and will be divided into seven bays; 1,000 sittings will be provided. The design is Early English throughout. The west front will be treated in an unusual fashion, with an external gallery connecting twin staircases, and with angle turrets to north and south. The cost of the entire scheme is estimated at upwards of £8,000, but at present a contract has only been made for the first section of the work, the erection of new nave and its aisles; this contract has been taken at £4,000 by Mr. J. Brown, of Chelmsford. The works were commenced four months since.

HONITON.—The chancel of the parish-church of Honiton has been restored under the direction of Mr. Edward Ashworth, of Exeter, by Mr. Harry Hems, of the same town. The contract embraced much new work, and a careful overhauling of the triple roofs of the chancel and its aisles, a new east window, the restoration of stone arcades, the laying of encaustic tiles in the sanctuary and various avenues, the provision of carved oak stalls and other chancel fittings—but more particularly the restoration of the almost unrivalled old rood-screen and its two accompanying parcloses. In a line with the parcloses, and continuing it to the sanctuary, and right up to the eastern wall, are new screens in English oak. The floor-line of the chancel rises one step above the nave at its entrance, and another at the sanctuary. This latter is a broad one of Keinton stone, and upon it rests the altar rail, which is of moulded oak, raised upon wrought-iron standards, supplied by Messrs. Thomas, Brawn, and Co., of Birminghan. The floors of all the approaches of the whole space within the altar-rails are laid with encaustic tiles. Into these and with them are introduced, with capital effect, some of the old diagonal black and white marble flooring, and some interesting grave-stones of ancient date are also incorporated into the floors. During the progress of the works, Mr. Hems came across—concealed in the wall—the original doorway communicating from the north wall, just eastward of the screen, by a flight of steps up to the broad rood-loft above. This, under the superintendence of the architect, he opened out. The old moulded jambs are now shown, and a ledge door of seasoned oak, ornamented with wrought-iron work, has been put up.

IPSWICH.—The new church of St. Michael, Upper Orwell-street, Ipswich, was consecrated a fortnight since. The building, which will accommodate about 400, is Early English in style and built of red brick, with Portland stone dressings externally and with Bath stone-work internally. The western gable end faces Orwell-street, and is broken by a porch, the main entrance to the church, and by a west window, with tracery of late Early English character. The gable is surmounted by a double bell turret, with two bells, and is finished with a stone cross 64ft. above the pavement. The roof is covered with thin Broseley tiles, with terra cotta ridge. The dormers on each side are finished with cut barge boards and tiled terminals at the apex of the gables. At present the nave consists of five bays only, but the site will afford room for the extension of the church eastward, by adding two more bays to the nave, and a chancel. The church now consists of nave and north and south aisles, the nave being 26ft. 3in. clear between columns, 58ft. 6in. in length, and 43ft. high to apex of roof. The arches, which are of rubbed and gauged brickwork, with mouldings at the angles, spring from massive circular stone piers, with carved capitals semi-Norman in character. The walls are entirely of red brick, with a dado of chocolate-coloured tiles, above which runs a white stone band; and above the arches, and at the level of the spring of the arches, run bands of darker bricks; a moulded stone band is also carried round the church beneath the clerestory windows. The roof of the nave is specially constructed to reduce to a minimum the lateral thrust upon walls. It consists of T iron principals, and ribs bolted together and cased up with Memel timber. It is boarded with stout fir boarding, the whole being stained a light oak colour. It is broken up by two dormers on each side, in each of which are three lancets. The aisle roofs are lean-to, with moulded principals and plain rafters, and ceiled between the rafters. The windows of the aisles are lancets in pairs. The church is seated with benches of pitch-pine and white deal. The pulpit is oak in two colours, and stands upon a plain stone base. The communion-railing is of walnut with light oak standards; the space within it being paved with marble mosaic, laid by Italian workmen, the initials S.M. being worked in. The building is warmed by hot-water pipes. Mr. E. F. Bishopp, of Ipswich, was the architect, and Mr. R. Girling the contractor. The hot-water apparatus was fixed by Mr. Felgate. Mr. Ebner, of London, did the mosaic work, and Mr. Harpham, Ipswich, the stonework, the carving of the capitals of the piers, &c., being the work of Mr. Kinnell. The cost has been £3,000.

SOUTHWARK.—A new church in Pepper-street, Southwark-bridge-road, which has been in hand nearly two years, is completed as far as the first portion—the chancel—is concerned. Mr. G. G. Scott is the architect. The style is Early Pointed, and the materials red Chelmsford brick, with Bath stone dressings. The internal walls, where not of stone, are stuccoed and left a natural colour. The work has been carried out by separate contracts. Mr. Harry Hems, of Exeter, has executed the whole of the stonework; Mr. S. J. Scott, of Bell Alley, London-wall, E.C., has done the carpenter's work. The brickwork was carried out by workmen put on by Mr. Edward Deacon, of 4, Reddin's-road, Peckham, the clerk of works, and that gentleman, under Mr. G. Gilbert Scott's own immediate supervision, has superintended the whole works. The church is heated with Mr. Grundy's apparatus. The cost of the works up to the present time exceeds £10,000.

CHIPS.

At a meeting held at Lechlade, last week, it was resolved to restore the parish church in accordance with plans prepared by Mr. Waller, diocesan surveyor for Gloucester, and at an estimated cost of £1,800. The first section of the work will be the removal of the present high pews, and their replacement by open seats.

A reading-desk of oak on stone base was, last week, placed in Soham church, Cambs. It has been made by Mr. Tooley, of Bury St. Edmunds, from designs by Mr. J. Piers St. Aubyn, of London.

The chapel of H.M. Prison at Stafford has recently been fitted with some handsome brass standards and altar-rails. The work is that of Messrs. Jones and Willis, Temple-road, Birmingham.

The Local Government Board have granted powers to the Eastbourne Local Board to borrow £3,850 for the purpose of adapting Mr. Isaac Shone's pneumatic sewage system at Eastbourne.

In the forthcoming building exhibition at Islington over 35,000ft. of space has been already allotted.

A new church is about to be built at Redruth on a site given by Lord Clinton. It will have a school-room beneath it, and will be built in sections, of local stone. Mr. J. P. Seddon, of Queen Anne's-gate, Westminster, is the architect.

At the meeting of the Gateshead School Board, held on Wednesday week, the contract for the erection of the schools, to be commenced immediately, on a site adjoining Durham-road, was let to Mr. Alexander Thompson, for £3,728. The architects are Messrs. Oliver and Leeson, of Newcastle.

The relighting of the parish-church, Edengate, Tamworth, has recently been effected by means of the new patent Hesperus lamp, manufactured by Jones and Willis, Birmingham and London.

More than Fifty Thousand Replies and Letters on subjects of Universal Interest have appeared during the last ten years in the ENGLISH MECHANIC AND WORLD OF SCIENCE, most of them from the pens of the leading Scientific and Technical Authorities of the day. Thousands of original articles and scientific papers, and countless receipts and wrinkles embracing almost every subject on which it is possible to desire information have also appeared during the same period The earliest and most accurate information respecting all new scientific discoveries and mechanical inventions is to be found in its pages, and its large circulation render its the best medium for all advertisers who wish their announcements to be brought under the notice of manufacturers, mechanics, scientific workers, and amateurs. Price Twopence, of all booksellers and newsvendors. Post free 2½d. Office: 31, Tavistock street, Covent-garden W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. R. M. TUTTLE, of 13 and 15, Laight-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Cases for binding the half-yearly volumes, 2s. each.

NOW READY,

Handsomely bound in cloth, Vol. XXXIX. of the BUILDING NEWS. Price Twelve Shillings. Order at once, as only a limited number are bound up.

N.B.—Cases and vols. must be ordered through a bookseller or newsagent, as the regulations of the Post-office prevent them from being sent by post.

RECEIVED.—M. Bros and Co.—S. B.—T. C.—T. H. C.—G. B. J.—F. K.—W. P.—T. and R. B.—E. C.—T. S.—D. and Co.—B. of H.

PERSPECTIVE. (There is no good book. A few lessons from a good man are what you want. Doubtless some of the artists who advertise in these columns would give them for a fair consideration.)—G. G. NEWMAN. (Your letter seems to us to deal with private matters beyond the cognisance of our readers, and if published would involve us in a succession of rejoinders and sur-rejoinders, for which we could not possibly spare space.)

"BUILDING NEWS" DESIGNING CLUB.

NIL DESPERANDUM No. 2. (For day-rooms, 20ft. floor space is a minimum, but for sick-wards 60ft. is not too much.)—REX. (We intended to have 8 beds in all. One accident-ward will be ample.)—A COMPETITOR. (The infectious ward should be isolated as much as possible from the other part. It would be certainly better as a separate room, or provision might be made for it as a temporary erection.)

Correspondence.

THE MANAGERS OF METROPOLITAN BUILDING.

To the Editor of the BUILDING NEWS.

SIR,—Mr. Walker, perhaps from not having at hand the article of which he writes in your last number, has in some cases mistaken its meaning; and in other cases brings forward as arguments against it what really appear to be no arguments at all.

1. It is not a fair account of the article in question merely to say that it "speaks disparagingly of the narrow capacity, culture, and ability of district surveyors." A more correct statement would be that it speaks so of *some* district surveyors. Its meaning, stated more precisely, is something like this: That if we could suppose a hundred of the highest and a hundred of the lowest names to be picked out by general consent from the roll of London architects, we might perhaps find half-a-dozen of each class among the district surveyors. Of course I am not supposing that the *status* of an architect is to be settled like that of a grocer, by the amount of his income.

2. The article does not insinuate that district surveyors in general "wink at the practices of speculative builders"; it only states that the system under which they work tends to make them do so. It, moreover, states expressly that this is not put forward as the usual result of the system. If I saw Mr. Walker standing on a flimsy scaffold, I might say, "That scaffold has a tendency to fall"; but this would be a very different thing from spreading a report that he had come to the ground and (*absit omen!*) seriously hurt himself. None the less for this, the fewer rotten scaffolds and the fewer rotten systems we have to do with, the better for us all.

I will next refer to some of Mr. Walker's arguments against reform.

1. As every surveyor has to make a monthly return of his fees to the Board of Works, and as these fees are on a fixed scale, Mr. Walker fails to see how malpractices about fees can arise. This is not at all surprising; but some out of the half dozen gentlemen at the bottom of the list perhaps could, if they would, enlighten him. What I, on the contrary, fail to see, is how these monthly returns and fixed scale can prove an effectual check to any man who really wants checking. Do the Board of Works examine every building with the minuteness which alone could detect ingenious peculations? If they do, that work alone is enough to keep them busy; if they do not, what real check is there? None, except a check against clumsiness and want of contrivance; none, except a check against doing the thing so stupidly that there shall be no defence if it chances to be found out. Suppose, for instance, a building, the principal story of which exceeds by a foot or two the height allowed for a certain thickness of wall. Suppose the surveyor objects to it, as he should, and demands the addition and piers. Suppose him at the same time to tell the builder, "This main building and these offices ought, in my opinion, to be looked on as three separate buildings, and my fees should be calculated accordingly"; and suppose that the builder, who knows well enough that the last claim could not be sustained for a moment if he contested it, should "split the difference," and give up the second point with the understanding that he should not be troubled about the first. Who is to find all this out? Do the Board of Works send round and measure the height of every wall to a foot? What invisible power, again, compels the surveyor to return the true amount of fees paid him in such a case? Or what is there on the face of the matter to show he has done wrong if he does return the true amount? The case is no imaginary one. I could take Mr. Walker to a building where the district surveyor objected for the reason named; mysteriously withdrew his objection, and withdrew it, the builder informed me next day, for the consideration assigned. The builder, no doubt, was as bad as the surveyor, but he had no motive for misleading me in the matter. I am not writing a "Manual of Building Acts Evasion," or I could give plenty of other contrivances which are found to work admirably in practice with the few surveyors who will stoop to them.

2. Mr. Walker says it is impossible to pay district surveyors by salary; that it would be unfair to tax the public for the purpose, and contrary to reason and all legal precedent. Why should it be more unfair to tax the public in order to insure the safety of public buildings than of public roads? The lives of the public are at stake in both cases. How, again, is it contrary to legal precedent? Inspectors of nuisances, I believe, are paid by a salary, and not by the number of nuisances they inspect. Why not inspectors of buildings also? No one, of course, wishes to do anything but what is absolutely just to the present occupants of district surveyorships. Let them, by all means, be put in as good a position as their present one, and if fees are retained, let builders pay them to the Board of Works direct, while the Board pays the surveyors a fixed and liberal stipend.

3. "It is absolutely false," Mr. Walker tells us, "that district surveyors try to make their districts preserves for private practice." Why so? "Because they are compelled by law to report every case where they are themselves so employed, and to get some other surveyor appointed to overlook them." A little milder denial, or a little stronger proof that the denial is correct, would, I think, have been an improvement here. What object could one district surveyor have in dealing out to another the same treatment which either of them might be tempted to deal out to an intruder? Daws do not peck out daws' eyes. There is a matter, too, which the non-professional world can judge of by experience, and every day people about to build will tell you, "I shall employ Mr. ———, the district surveyor; we all know it saves a lot of time and money."

4. The article I am defending, seeking only to deal with systems and practices, expressly guarded itself against criticism of recognisable individuals, either at the Board of Works or elsewhere. But it was not written without many years' experience of applications, appeals, correspondence, and no-respondence. The last may, for ought I know, be an institution peculiar to Spring-gardens, and hardly introduced yet into public offices; but its effect is to compel the inquirer to that personal attendance which unimportant people, like the present writer, generally feel it due to their self-respect to avoid. On the question of appeals, we have only to remember that district surveyors are the persons appealed against, and that Mr. Walker is himself a district surveyor, in order to draw valuable inferences from his satisfaction with the existing mode of conducting them.—I am, &c.,

THE WRITER OF THE ARTICLE.

MODERN DOMESTIC ARCHITECTURE.

SIR,—In your issue of last week, Mr. Phipson asks "where has 'Delta' been looking if he cannot see that, for the last three hundred years, and until quite lately, we and other European nations, have been doing little else than 'endeavouring to revive Greek art'"? Since I have not seen as Mr. Phipson has, I shall be obliged if he will mention any building in Great Britain three hundred years old, and in which there appears this endeavouring. I should like much to see it, because "the outcome of this three hundred years' effort is the eternally reiterated Corinthian capitals and Classic mouldings which line miles of streets in Belgravia, Kensington, and compose the whole of such wearisomely ugly cities—even if only for their very monotony—as Glasgow and Berlin"; an outcome that, after after no less than three centuries of endeavour, is certainly somewhat surprising. Wheresoever I may not have been looking, I am so intimately acquainted with at least Glasgow, that I can say if it be "ugly" and "monotonous," it is certainly not *because* of its examples of Greek architecture. On the contrary, much of its Greek architecture is of the greatest excellence, the "outcome" of rare creative genius and the highest culture—an architecture that I suspect might relieve the "monotony" which likely enough characterises the "Greek" (?) of Belgravia and Kensington.

It is thus that Mr. Phipson himself characterises the Greek:—"As a matter of fact, the Greek style is one of the most rudimentary and unscientific—its beauty, arising merely from the good taste shown in the working out of its simple construction." I would like to ask him "where," or *how*, "has he been looking," if he can see nothing but the "rudimentary" in its unrivalled proportion and symmetry; in its exquisite detail; in its tender shade, and deep, yet soft shadow; in the entasis of the column; in (in some instances) the inclination of the axis; or in the curvature of the great base-steps of the Parthenon; if he can see no other beauty than that arising merely from the good taste shown in the working out, in the composition of the High School, Edinburgh, or in the detail of the finial of Burns' monument at Alloway?

I do not ask anyone "to throw away all the æsthetic experience we have gained from the last 2,000 years," although it has no more given to this century a greater sculptor than Phidias, or a greater epic poet than Homer, than have 300 years of "endeavouring to revive," given as their "outcome" *Greek* art. There are some things which "age shall not wither, nor shall custom stale," which "the world will not willingly let die."—I am, &c., DELTA.

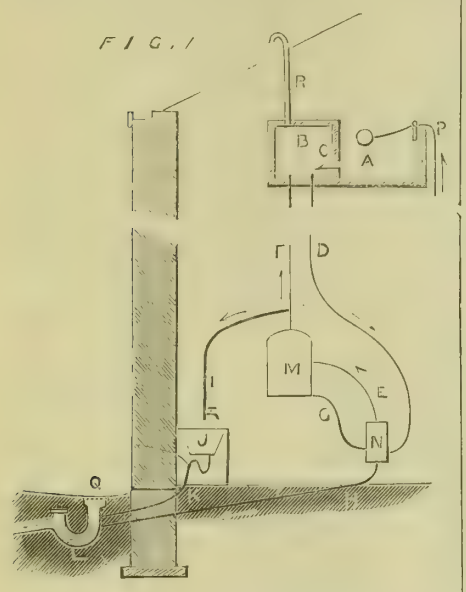
FROZEN WATER-SUPPLY PIPES AND KITCHEN-BOILER EXPLOSIONS.

SIR,—In many cases a little extra attention, thought, and expense, *while the fittings are being put in*, would often prevent annoyance from pipes, &c., freezing and bursting, and so save considerable expense afterwards. In one house I have in my mind no provision was made to empty the kitchen boiler. The house has been shut up all the winter until a few days ago,

when, upon letting the water on, it was found that the hot-water cylinder and the boiler, lately supplied, were both frozen up and had burst. Mending this will cost about twenty times as much as the putting in of a scour-cock and pipe at the proper time. The plumber's advice in the summer time, to provide against frost, is often scouted as a mere attempt to get extra work.

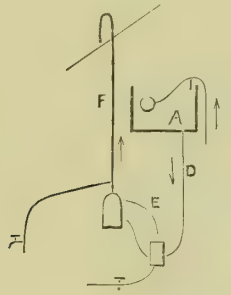
In the following drawing, Fig. 1, an *extra-*

FIG. 1



safety plan of fitting in the hot-water pipes is shown which, especially with a little attention, will not only help to give greater safety against the kitchen-boiler exploding, but will also help to prevent the cold-water supply-pipe from freezing. The improvement here (in addition to wrapping the pipes with felt) is to supply the kitchen-boiler from the small hot-water cistern B, in place of from the cold cistern A, as shown

FIG. 2.



in Fig. 2, and which is generally done. M is the hot-water cylinder, with expansion-pipe F leading up into the hot cistern, and which may have a hinged valve upon its top. All draw-off cocks are to be taken from this expansion-pipe, so that the cylinder M may not be able to be emptied by any of them. It is a bad plan to branch any crane off either of the circulating-pipes, E or G. I is the hot-water supply to the sink J, and K the waste-pipe of the sink. L is a disconnecting or grease trap outside of the house and joined to the drain. H is the scour-pipe of the kitchen-boiler N, with a stop-cock upon it. Now, in the time of frost, if the hot-water crane at the sink at J is left constantly trickling a little, it will keep up a movement of the water in the supply-pipe P, and prevent it freezing up so readily, while all the pipes, D, E, F, G, and I being warm, they cannot freeze. The waste-pipe of sink K being under the ground will hardly freeze either in this case, especially if the grating at Q be covered over while the frost lasts. In this case case, too, it may easily be seen if the pipes D and F are all clear by either blowing into or pouring water down the pipe D, and seeing the effect produced at the top of the pipe F. C is the pipe connecting the two halves of the cistern with a hinged valve at the hot end. With this Fig. 1 plan the fire in kitchen may be kept on without danger, even when the water-supply by the pipe P is temporarily stopped, so being that water is poured by hand into the cistern B, and not drawn off; so long as the cylinder M is full of water, and the expansion-pipe F clear, the fittings are safe, and especially if water poured into the top of the pipe D rises up through the pipe F. As an extra precaution, a safety-valve might be put on upon the cylinder M. It would be useless, however, if the fire had been off and the pipes E and G frozen. In this case the valve would be safer were it fixed to the boiler, but this is easier done with exposed boilers than with close ones.

In closing, I may recall a precaution regarding supply and outlet pipes of boiler and tank M, mentioned at page 208 of this journal for February 21st, 1873, inattention to which is possibly the cause of some of the late boiler explosions, viz., that there should be no "bagging" in any part of course, but—and especially in the expansion-pipe—a rise upwards in every part of the route.—I am, &c.

W. P. Buchan, S.E.

EXTERNAL-SOIL PIPES.

Sir,—I am sorry to find that Mr. Buchan's reply does not afford a sufficient explanation of the special objection which he makes to soil-pipes fixed inside the house, that "they generate and give out into the air more bad gas than those fixed externally."

The probability of leakage into the house is not under discussion, and I do not pretend to express an opinion as to whether, upon the whole, such pipes are better fixed inside or outside. There is at present a very great diversity of opinion upon the subject, and I have only professed to give certain facts which have come under my own notice as to what I myself and others have done.

But Mr. Buchan's illustration of the privy is nothing to the point. A properly ventilated soil-pipe cannot be in any way compared with a stagnant cesspool; it is simply misleading so to invite the comparison and, if I find, as I do in fact, a free constant upward current through my soil-pipe, I may safely conclude that any decomposition of the accretions on its inside will be reduced to a minimum.

Surely some further explanation is needed to account for his startling fact that an increased rapidity of air-current through a soil-pipe favours decomposition rather than oxidation. I did not assume, nor could I suppose, that there would be in a stoneware, or even a metal pipe, fixed inside the house, any such heat as to favour decomposition, but only that amount of difference between the temperature within the pipe and that of the outside air, which would create a current otherwise neutralised by the chilling of the pipe if subjected to exposure.

Mr. Buchan is usually so correct in his views and accurate in his explanations, that I can only suppose him to be under some misapprehension as to what it was I endeavoured to point out.—I am, &c., William White, F.S.A.

Sir,—In reply to "A. C. G.," I would inform him that I have found the open grid-traps, such as Stiff's, Stridder's, &c., &c., may be kept from freezing up by the old-fashioned remedy of pouring down a little strong salt-and-water from time to time.

I dare say the same might be tried with a lead soil-pipe, but I have not had occasion for it. My experience of outside soil-pipes does not show me that they are liable to freeze up; they are not supposed to be ever *filled* with water, like a supply-pipe.

While with my pen in hand, may I ask some sanitary reformer kindly to point out for our benefit, what are the real structural defects of the *Bell-trap* and D trap, and in what precise point they are in fault? I never find that anyone has ought to say further than that they are *obsolete*; but there must surely be a more satisfactory way of defining the matter.

Some twenty-six years ago I was taken over premises in Liverpool by one of the sanitary inspectors, and shown the amendments just carried out, viz., three bell-traps in sinks, and one large gulley outside bell-trap; and these were indicated to me as illustrating a valuable sanitary lesson, that I was then too young to call in question, although I did not see it at the time. I have lived to see such things denounced, like many other so-called sanitary contrivances; but surely the laws of science are unvarying and not subject to changes of fashion.—I am, &c., B.

BURTON-ON-TRENT MARKET-HALL COMPETITION.

Sir,—Referring to the notice in last week's Building News as to the alteration in the award of premiums in this competition, I shall be obliged if you will allow me to state what the proof, which I submitted to the Council, consisted of; in order that the profession and the public may judge whether I have been treated fairly or unfairly in this matter.

When first asked to show that the building could be erected for the stipulated amount, I made calculations such as are usual, and informed the Markets and Fairs Committee that I was satisfied that the hall could be built within the sum named. This not being considered satisfactory by the committee, I took out detailed quantities for the work, forwarded a copy of the bill of quantities to the committee, and with it inclosed a tender from one of the largest contractors in Birmingham, offering to execute and complete the whole of the work in accordance with my plans, for the sum of £8,250.

This the committee, acting I am informed (though it is difficult to believe), on professional advice, deem "insufficient and unsatisfactory" and decline to inform me what further proof they require, or could possibly have.—I am, &c.,

The Owner of Plan No. 8.

Birmingham, Feb. 16.

FIGURES IN GLOUCESTER CATHEDRAL.

Sir,—A correspondent kindly draws attention to a clerical error I fell into in a recent issue, by referring to the late talented sculptor of the above as Mr. W. Redfearn, instead of Mr. J. H. Redfern. But the most remarkable thing seems to be that any ordinarily informed person should have doubted the existence of Mr. Redfern's renowned sculpture in the Gloucester Cathedral reredos at all! There does appear, however, reason for some little uncertainty as to what particular stone the sculptor selected for his work. Mr. John Hunt, the courteous sub-sacrist of that cathedral, was my authority for quoting it as from the Cooper's Hill quarries. The other day, Mrs. Esther Tuffley, of Nailsworth, expressed to me her strong belief that the stone in question was from *her* quarry at Ballsgreen, near Nailsworth. Again, on turning to a contemporary (*Builder*, Feb. 22, 1873), I find it therein stated that Redfern's groups and figures are wrought in stone from Mr. Wingate's quarry on Crickley Hill.

These various statements go to show that it is not altogether clear what particular sort of Painswick stone was used. There is no uncertainty, however, about the power and the ability that every line of Mr. Redfern's sculpture displays. His early death is the more to be lamented, when we realise to the full—now that he has gone—how few men are left behind him worthy to take his place.—I am, &c., Harry Hems.

SHEFFIELD PARISH-CHURCH FONT.

Sir,—With regard to Mr. Drury's letter in your last issue, I deem it necessary, as I was the cause of this correspondence, that I should give some explanation of my dissatisfaction.

As I stated in my first letter, my drawings were returned, carriage paid, but no "letter of thanks with the names of the successful competitors" accompanied them. This it would seem was simply an oversight; but as no announcement of any kind appeared in the professional journals, I naturally expected that if all competitors were treated in the same manner there would be general dissatisfaction. To extract information on the subject was therefore the cause of my procedure; but as Mr. Drury has now intimated the names of the successful competitors, and given a satisfactory statement, there remains nothing more to be said.—I am, &c., A Last Resource.

SEWER VENTILATION.

Sir,—I see the question of inside or outside soil-pipes is being discussed in your paper. I am certainly in favour of inside pipes, taken up through the roof and ventilated there, for several important reasons.

Firstly. The warmth of the house facilitates the action of the ventilating pipe.

Secondly. The pipe is protected from frost, but it should always be so placed as to render easy inspection at any time.

Thirdly. You avoid the necessity and risk of passing your closet junctions through the outer-wall to connect them.

Beyond this, I think my report* will explain itself, as I have endeavoured to make it as clear as possible to non-professional readers—such as are usually met with in town councils.—I am, &c.,

R. Read,

Assoc. Memb. Inst. C.E., City Surveyor.

* Epitomised on p. 193, under the title of "The Ventilation of Sewers."

"THE CAPABILITIES OF RENAISSANCE."

SIR,—I see that in his paper on this subject read in Edinburgh, Mr. Dewar—it may be from some escape of memory—has unfortunately confounded the works of two great architects. He is speaking of the architecture of Glasgow, and after paying a tribute to the genius of "Greek" Thomson, no less happily expressed than it is deserved, he instances "that masterpiece, St. George's church and spire," as one of his chief works. St. George's spire, a composition of singular originality and beauty, is in every respect a masterpiece, but it is the work, not of J. Thomson, but, as are several other great works in Glasgow, of Mr. Stark, of Edinburgh. The church to which Mr. Dewar refers, when he says that in it "'Greek Thomson' has erected what a man of genius only could have accomplished, a building fitted to rank beside the greatest works of ancient Greece," is, in all probability, the United Presbyterian Church in St. Vincent-street, a building of great grandeur of composition and unrivalled beauty of detail.

If I mistake not, there was not long ago, by another critic than Mr. Dewar, another work in Glasgow ascribed to Mr. Thomson which was not his. Thomson's work is not only so unique, but by careful observers is so unlikely to be confounded with that of his imitators, that it seems surprising such mistakes could possibly be made.—I am, &c.,

T. G.

DOMESTIC BUILDINGS ON PIERS AND ARCHES.

SIR,—It has on many occasions suggested itself to me, especially so after the heavy fall of snow, why the architects of the present day should not have advocated the erection of domestic buildings on piers and arches, so that the underside of the usual living-floor would be some two or three feet above the level of the ground line, so that a free current of pure air would entirely surround the building.

Why we should cling to the Ancient British idea of burying ourselves some few feet below mother-earth I cannot understand, and by so doing lay ourselves open to sundry diseases and serious consequences; but were the idea carried out, there would be no need of the many patent damp-courses; neither should we experience rotten floors and woodwork. Besides, the whole of the pipes which underlie the building would be at once accessible should there be an escape or leakage, and the unpleasant disturbance of floors from such a cause would be done away with.

Taking this idea on the first principle, that of health, it must be obvious to all that it needs consideration, and the additional height in the buildings would not be a very heavy item to the cost.

I believe Dr. Richardson's "City of Health" was to be built on this principle, but in a far more expensive manner. I hope some day to see this idea embodied in local by-laws where it is practicable in buildings.—I am, &c.

FREDK. W. HYDE.

LIVERPOOL SCHOOL OF ART.

SIR,—I read with much pleasure the two letters in last week's BUILDING NEWS, and endorse every statement therein. Mere writing, however, by individual competitors will avail us nothing, whilst, by unity of action, we might teach the gentlemen concerned such a lesson as would impress itself upon them and the public generally in such a way as to prevent the recurrence of such barefaced scandals.

What I suggest is, that each of the 80 competitors subscribe towards a common fund for the purpose of bringing the case before a jury of disinterested men, so as to see whether any committee can advertise for plans on specific terms, and set same at naught after putting architects to considerable loss of time and money. I shall be glad to subscribe £5 to such a fund, and should be glad if my brother competitors would communicate to you their names and subscriptions, when the necessary arrangements can be made for an early trial.—I am, &c.,

A COMPETITOR.

[We have received several other letters having reference to this competition, for which we cannot spare space. "Another Competitor" offers half a guinea towards the fund.—ED. B. N.]

The town-council of Birmingham on Tuesday instructed Messrs. Martin and Chamberlain to prepare plans for public baths in Monument-road, estimated to cost in execution £22,000.

The new church of St. Paul, Bournemouth, was consecrated on Tuesday by the Bishop of Winchester. It is Early English in character, and has been built from the plans and designs of Mr. A. H. Parken.

A stained-glass window is about to be placed in the north transept of Holy Trinity Church, Twickenham; it is supplied by the Gateshead Stained Glass Company, Newcastle-on-Tyne.

Intercommunication.

QUESTIONS.

[6395.]—**Oak Paling.**—Will some reader kindly say what is the best means of preserving a Riga oak paling, all wrought and exposed to the weather and smoke of a town? I should prefer to retain the grain of the wood.—X.

[6396.]—**Bell-Turret.**—I am at present engaged in designing a bell-turret, supported on four turned oak standards, and I should be obliged if any of your readers would kindly assist me to find the smallest section of the said standards at any point. The turret is a square pyramid, 10ft. high from eaves to finial, and 3ft. square at base, and the supporting standards 5ft. high. Do not take the weight of turret into consideration, but only regard wind-pressure and scantling of oak standards.—BELL-COTE.

[6397.]—**Area Walls.**—Under an ordinary lease of a dwelling-house landlord has to keep main walls and timbers in repair, and, amongst other obligations, tenant has to keep the boundary walls in repair (there being a considerable extent of garden and yard). Recent frosts have seriously damaged the area walls round house. These areas are wide and open, thus the wall is a kind of retaining one to keep up the soil behind it. Whose duty is it to repair these walls, involving in part their being rebuilt? Landlord denies his responsibility, alleging they are boundary walls.—ENQUIRER.

[6398.]—**Workhouse Plans.**—The guardians of the —— Union advertised the following in our local paper:—"To Architects and Contractors. —— Union. New School-House. The Guardians of the above Union invite plans, specifications, and estimate of a proposed new school-house and tramp-wards at the workhouse on or before the 31st day of January. For further particulars apply to Clerk of the Guardians." In answer to the above, three plans, &c., were sent in. The guardians chose one of them, which was sent to the Local Government Board for approval, but was returned to be altered. In fact, they were so altered that they were nothing like the original, and the tramp-wards were altered that they are now almost identical with the plans sent in by me, and not according to the original plan sent in by the successful architect. Will you or any of your correspondents tell me whether I have any claim on the guardians for my plans, &c., taking into consideration the wording of the advertisement, and, if any, what would be a fair charge?—FAIRPLAY.

[6399.]—**Filtration.**—I should like to know the best work on filtration of potable water.—ENQUIRER.

[6400.]—**Staining Pitch-Pine Green.**—Will some kind correspondent inform me the ingredients, and how to apply them, in order to tint pitch-pine a clear pale green?—B. J. M.

[6401.]—**Modulus of Rupture.**—I read in Rankine "the modulus of rupture is 18 times the load that will break a bar 1in. square, supported at two points 12in. apart." Will somebody be kind enough to explain this for me? I want to know why it is taken as 18 times the breaking weight?—M. I.

[6402.]—**Quantity of Stone in Spire.**—In taking off quantities, which is the customary method of obtaining the cubical contents of stone in a spire—to get the net quantity only or take for each stone the smallest rectangular block out of which it can be cut? I presume the latter, so as to allow for the waste, which would be consirable, but I should like the opinion of someone with more experience than—NOVICE.

[6403.]—**Builders' Accounts**—In billing extras and deductions, is it better to subtract the smaller from the larger items of the same description in the abstract? For instance, 70 superficial yards of plastering as intended from 90 as executed, in consequence of alterations, simply carrying the difference of the two amounts or 20 yards to the bill of extras, or show 90 yards in the column of extras and 70 yards in that of deductions.—X.

[6404.]—**Sanitary Engineering.**—In Baldwin Latham's work, page 45, it is stated that in the case of a 2ft. barrel sewer running 3in. deep, with a fall of 1 in 550, or a velocity of 1·6ft. per second, it will require a drop in the invert of 6·29ft. for the water to pass over an opening 1ft. wide. With a velocity of 2·25ft. per second the drop should be 3·25ft., and with a velocity of 3ft. per second the drop should be 1·7ft. Will some of your readers kindly explain how the "drop" is arrived at?—A. N.

REPLIES.

[6371.]—**Stone Work.**—You cannot legally demand payment for the extra quantity of stone used, unless an order was given for the same by the architect after the contract was taken, in which case you could show evidence of the extra quantity used. Extra work or material to be paid for ought to be granted only under the order of the architect in writing. "Yorkshire" had better make arrangements to have his work measured if the architect is willing to adopt this mode of adjustment.—G. H. G.

[6372]—**Architects' Charges.**—"Juvenile" can charge on the total cost of building, including extras ordered, over the £500.—G. H. G.

[6373.]—**School Plans.**—Each class-room is, doubtless, intended for 40 boys. It is recommended that the number in class-rooms and the school-room should be equal. An area of 13ft. 6in. to each pupil is sufficient. The principal school-room should be large enough to allow 80ft. (cubic) space per child, and this is the allowance made by the School Board for London.—G. H. G.

[6390.]—**Whatman's Paper.**—Owing, doubtless, to damp. Six years is too long to keep drawing-paper. It may possibly have been badly sized at first. Sponge well with alum water when straining the paper, though this will not always answer if the spotting has gone too far.—B.

[6392.]—**Pipe-Jointing.**—I am of opinion the external cement jointing is better avoided on clay, as the former shrinks or cracks and makes the joint useless. Concrete is a good material for jointing, and when there is any risk of settlement the pipes are best laid in concrete. A great deal depends on bedding the joints of pipes evenly, for the slightest settlement disturbs the joint. The sockets especially should be free from pressure. I should prefer for wet subsoils an asphalte-joint, the trench being lined with clay puddle.—G. H. G.

[6394.]—**Entasis of Greek Column.**—Information on this subject will be found in Tarn's "Practical Geometry" (Lockwood and Co.), pp. 82, 95, and 101.—ARCHITECT.

WATER SUPPLY AND SANITARY MATTERS.

THE VENTILATION OF SEWERS.—The Corporation of Gloucester have received a report on the ventilation of sewers from the city surveyor, Mr. R. Read, A.M.I.C.E. It seems that in 1875-7, the outlying districts of the City were resewered, from the plans of Mr. Mansergh, C.E, who provided street ventilators throughout at about 60 yards interval. The smells from these ventilators soon occasioned complaint, and, contrary to Mr. Mansergh's advice and that of the Local Government Board inspectors, charcoal buckets were placed on the ventilators, but as their effect was simply to block the openings, they were removed after nine months' trial. Mr. Read says he has since opened ventilators in all the old city sewers, and though the smell at first was rather intense in the summer-time, it has gradually diminished, and the deaths from miasmatic diseases have decreased from 149 in 1877 to 120 in 1878, and 60 in 1879, an improvement which he attributes partly to the free ventilation and partly to the extension of the city water supply. Experience has shown that there are still a large number of old unventilated sewers in the outlying districts recently added to the city; and, as ventilation would be difficult, costly, and likely to lead to opposition from private owners, and withal ineffective unless supplemented by flushing from the street mains, Mr. Read recommends the corporation to do away with all old sewers at the backs of the houses, and to connect every house with the new system in the street front. This process has been gradually going on since the new sewers were laid, but it needs acceleration, and this can be done in either of two ways under the Public Health Act of 1875: 1st, by compelling each owner to connect his house with the new sewers at his own expense; or 2nd, by raising money on loan for the corporation to carry out the work themselves. If these old sewers are abandoned and disconnected, Mr. Read believes that the Gloucester sewers will be as perfect as any now in existence, and very little, if any, smell will arise from the ventilators that cannot be got rid of by flushing; at the same time he observes that the principle of the ventilation of sewers has never yet been carried to its logical conclusion, or applied in such a manner as to effect its undoubted purpose, viz., that of producing and ensuring a continuous draught of air of such a strength as to render it practically independent of the atmospheric changes, to which the feeble respiratory action of the present system of ventilation is so extremely susceptible. This can only be done by treating the house-drains in combination with the public sewers as one complete system, and the attempts hitherto made to separate them are, he asserts, based upon a fundamental error, the result of unreasoning panic amongst householders, divided authority, and independent action amongst sanitary engineers, architects, builders, and medical men.

THE DISPOSAL OF REFUSE.—A report on the disposal of house and street refuse has been presented to the vestry of St. Pancras by a special dusting and slopping committee. The members state that they visited Manchester, Salford, Rochdale, Bury, Warrington, and Leeds, all towns in which the contents of privies or middens have to be disposed of, and in all cases they found adopted some mode of destruction by fire in furnaces. The sorting was generally done by machinery, and the primary object of the operation was to find fuel for the working of machinery for manure making. The Manchester dust depot is described as a general municipal manufactory, where many descriptions of skilled labour and mechanical contrivances are in operation, which seem to have brought the Manchester corporation into competition with the ratepayers, by carrying on the trades of machinists, carpenters, builders, wheelwrights, tinmen, brushmakers, &c. This development the committee deem a very questionable policy for a public authority to adopt, and admirable as the system undoubtedly is for Manchester, where the pail-closet system is in operation, it does not appear to the committee suitable for London. At Leeds and Warrington, all the ordinary house refuse is consumed except the human excreta, which is sold without any mixture, to farmers. While there was some doubt as to the best form of furnace and mode of burning, the committee considered that destruction by burning was, both from sanitary and

economical points of view, the system most applicable to London. The disposal of residuum might be left for future consideration. Having shown the undesirability of attempting to establish one central depot for the whole district, and urged that the efficient collection of dust is of scarcely secondary importance to the disposal of refuse, the committee concluded by recommending :—

1st. The vestry should decide whether the collection of dust should be in the hands of the vestry, or the contractors, and your committee are of opinion that the collection should be in the hands of the vestry.

2nd. Whether this is decided in the affirmative or the negative, your committee should be authorised to prepare draft regulations for collection for the consideration of the vestry.

3rd. That if the contract system is to be continued, your committee should report on the modifications which are required in the present form of contract.

4th. That whether the vestry decide upon doing their own work as dust collectors or not, the refuse be partly or wholly burned, and, therefore, your committee should be instructed to seek for a site, for works, and that the vestry should offer a premium of £50 for the best scheme of disposing of refuse by fire, accompanied by plans and other details.

LEGAL INTELLIGENCE.

ARCHITECTS' CRITICISM ON ARCHITECTS.—The adjourned inquest on Timothy O'Leary, a labourer, who was killed by the fall of a rubble wall at the new Public Hall, Devonport, was resumed on Tuesday. In our previous report, in our issue for January 28 (page 114), it was mentioned that Mr. Hine, architect, of Plymouth, expressed the opinion that there was an error of judgment in the erection in rubb e-work of so thick an unbuttressed wall as that which fell, and that insufficient time was allowed for consolidation ; Mr. Samuel Knight, of Cornhill, London, E.C., the architect of the building, asked for an adjournment to produce professional evidence as to the design. At the adjourned inquest, Mr. E. A. Gruning, F.R.I.B.A., of Gresham-house, E.C., deposed that he was appointed assessor on the competition designed for the public hall, and as such selected for adoption the plans of Mr. Knight, who was then a stranger to him. He had examined the contract-drawings, and found the thicknesses of walls greater than would be required by the Metropolitan Building Act. He had seen the wall which had fallen, and considered the work very well executed, the mortar being equal to cement. He believed the wall, if built again under more favourable circumstances, would stand. The work was carried up too rapidly in wet weather, and he thought the wall fell forward because of a combination of damp mortar, the face of the wall being heavier than the backing, and the depth of indentations in the face of the piers below the cornice. In his opinion, there was no error in judgment in the design of the wall, or of conduct in the superintendence of the building. Mr. Hine called attention to clause 6 in part 2 of the first schedule in the Metropolitan Building Act, which provided that where the thickness of a wall was less than one-fourteenth of its height, the thickness should be increased in that proportion. Witness said he had given attention to the clause, but he denied that it was intended for this class of work, or that the work put into the wall in question required it. Mr. John Watson, architect, of Torquay, had had extensive practice in rubble masonry construction, and could see no error in the design of the public hall, and no inherent weakness. The wall ought not to have been carried to so great a height in wet weather without a cessation to allow the mortar time to dry. Mr. Arthur Cates, of London, Crown Surveyor of H.M. Woods and Forests, reported that the walls were, in his opinion, sufficient for the purpose, and that if slowly built and protected from soakage they would be stable. Mr. T. Roger Smith, district surveyor of Southwark and part of Lambeth, reported, "Had these plans been brought before me officially, as those of a rubble building to be erected in my district, I should have considered the thickness of the walls and the general distribution of piers and openings as satisfying the requirements." Mr. G. B. Williams, also a district surveyor under the Metropolitan Build ng Act, said: "The contract drawings are properly and carefully designed, and if carried out with care and without undue haste the work would have stood properly." The Coroner expressed the opinion that the fall of the wall was a pure accident, over which none of the parties interested had any control. It seemed that the accident was to be attributed to the indentations, combined with the excessive wet weather, which prevented the motar from setting. The clerk of the works might have been a little too sanguine and a little over-anxious to get on with the work, and proceeded with the work perhaps a little fast in the wet weather. But the accident was attributable not merely to one cause, but to a combination of causes. The jury returned a verdict of accidental death, and exonerated all concerned from blame.

Our Office Table.

THE Metropolitan Board of Works and the Corporation of London are at issue as to the much-debated Bill projected by the Great Eastern Railway Company with respect to Epping Forest. The latter have given the Company their support; the former, on the other hand, decided last Friday by 20 to 11 to petition Parliament against the Bill for making a railway from Chingford to High Beech, and against taking any part of the Forest for the proposed extension. The Corporation has been at fault. It saved a beautiful spot which was fast being nibbled away, and now its Council as the Conservators of the Forest have already forgotten their duty, and require to be taught it by the Metropolitan Board of Works.

THE Chief Commissioner of Works and the authorities of the City of London have, we hear, been unable to bring about an arrangement for the removal of Temple Bar obstruction. Unless some satisfactory arrangement can be come to, it is understood that provisions will be made to abolish the exceptional powers at present possessed by the City authorities, enabling them to erect such memorials in public thoroughfares, independent of supervision, and to place the area under their jurisdiction in exactly the same position as other parts of the metropolis, in which the consent of the First Commissioner of Works requires to be obtained before any statue or memorial can be erected.

A SCHOLARSHIP, or rather travelling studentship, for the exclusive object of furthering the study of purely decorative painting has thus far been wanting, and it is no doubt singular that this should have been the case while so many studentships in connection with painting and architectural art have from time to time been founded. The "Painters' Company" have, however, now offered the "Mence Smith Travelling Studentship" of forty pounds, to be increased under certain conditions to fifty pounds, for competition among the students of the West London School of Art, and the particulars of the scholarship were announced to the students on Monday evening last, at a meeting held for the purpose, by Mr. John S. Rawle, the head master. The conditions, which we need not here enumerate, are of the most desirable kind, and the competition cannot fail to attract many able competitors. The first competition will take place in February, 1882. The successful competitor will be required to spend at least two months abroad, and will be required to make sketches and notes of works of coloured decoration, which will be submitted to the committee on his return. Should the student elect to visit Paris, or such parts of the Continent on this side the Alps as may be arranged, £40 will be the entire payment, but £50 will be given if Italy be visited. We commend the studentship to those for whom it is intended.

THERE are serious objections to be urged against many of the new schemes for tramways in various parts of London. One of the greatest is the stoppage of and interference with traffic in narrow roadways, to the great annoyance of passengers and to the injury of the trade of those who have shops along the route. A more lasting disadvantage is occasioned by the tram-lines taking up the best part of the roadway, and causing greater wear by the cutting up of the surface. It is no wonder that strong opposition to projects of this kind has come from many of the vestries of late by the attempt to lay tramways in very narrow thoroughfares, thereby subjecting shopkeepers to inconvenience, and the margins of the roadways to constant repair and repaving. We happen to known of one part in the route of one of the South London Tramway lines, where the residents have been subjected to a repetition of this grievance, amounting in each case to an obstruction of all traffic, vehicular and pedestrian. If tramways are public conveniences, and we are inclined to think they are, the companies would be serving their objects better by contenting themselves with the wider thoroughfares.

IN consequence of the strictures recently passed in the Dublin newspapers on the decaying condition into which St. Patrick's Cathedral in that city has been allowed to fall (see p. 167 of our last issue), a special meeting of the cathedral board was held on Monday, under the presidency of the Dean, "to consider the ravages which ground-damp has made in the fabric of the cathedral." Mr. Boyle, C.E., reported that he had had the levels of the River Poddle specially taken that morning, and found it to be only 2ft. 7in. below the level of the floor of the cathedral. He was, therefore, certain that there was a large lodgment of water under the cathedral floor, which could not be drained into the Poddle at its present level. A letter was read from Mr. J. J. Fuller, architect to the cathedral, in which he strongly recommended that the most urgent thing to be done was the cleansing and deepening of the watercourse of the Poddle, a river which had often flooded the cathedral, and that accomplished, the floor should be re-set in waterproof concrete, and the decayed stone in the bases of the pillars cut out and replaced. It was resolved to form a special committee, and to inaugurate a fund for the purpose of carrying out the recommendations.

Throat Irritation.—Soreness and dryness, tickling and irritation, inducing cough and affecting the voice. For these symptoms use Epps's Glycerine Jujubes. Glycerine, in these agreeable confections, being in proximity to the glands at the moment they are excited by the act of sucking, becomes actively healing. Sold only in boxes, 7½d. and 1s. 1½d., labelled "JAMES EPPS and Co., Homœopathic Chemists, London." A letter received: "Gentlemen,—It may, perhaps, interest you to know that, after an extended trial, I have found your glycerine Jujubes of considerable benefit (with or without medical treatment) in almost all forms of throat disease. They soften and clear the voice. In no case can they do any harm.—Yours faithfully, GORDON HOLMES, L.R.C.P.E., Senior Physician to the Mu Throatclip eat and Ear Infirmary."

CHIPS.

Plans prepared by Mr. Arthur Baker for the enlargement and improvement of the Rhyl town hall were approved and adopted by the improvement commissioners of that watering-place last week.

The Manager of the Glamorganshire Banking Company of Swansea, whose new premises we illustrated on December 17 last, wishes to state the company is an unlimited one, and not limited, as was stated in our illustration.

The tower of the parish-church of Springfield, next Chelmsford, a structure built early in the 12th century, having shown symptoms of failure, is about to be restored from the plans and designs of Mr. Joseph Clarke, F.S.A., the diocesan architect for St. Alban's.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill. *Ure no substitute.*—[ADVT.]

Holloway's Ointment is not only fitted for healing sores, wounds, and relieving external ailments, but rubbed upon the abdomen it acts as a derivative, and thus displays the utmost salutary influence over stomachic disorders, derangements of the liver, irregularities of the bowels, and other intestine inconveniences which mar man's comfort.—[ADVT.]

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—London Institution. "Art Among the Ancient Greeks." By J. E. Hodgson, R.A. 5 p.m.
Royal Academy. Lectures on Architecture by Professor G. E. Street, R.A. No. III. "The Development of Styles." 8 p.m.
Institution of Surveyors. "Ecclesiastical Dilapidations." By G. R. Crickmay, of Weymouth. 8 p.m.

TUESDAY.—Institution of Civil Engineers. "The Weight and the Limiting Dimensions of Girder Bridges." By Max am Ende, A.M.I.C.E. 8 p.m.

THURSDAY.—London Institution. "One Aspect of Colours." By Captain W. de W. Abney, F.R.S. 7 p.m.
Royal Academy. Lectures on Architecture by Professor Street, R.A. No. IV. "Thirteenth Century Architecture—Italy." 8 p.m.
Society for the Fine Arts. "Book Decoration." By J. W. Bradley. 8 p.m.

WANTED.

TO ARCHITECTS.—An Architect's Assistant requires a SITUATION; can be well recommended by present employer; terms moderate.—Address, F. LONG, Town Hall Chambers, Bradford-on-Avon.

WANTED, a SITUATION as Assistant in an Architect's Office; passed the R.I.B.A. Preliminary Examination, 1880; also Science and Art Examinations in Advanced Architecture, Advanced Building Construction, and holds full Drawing Certificate; first-class references.—E. H. D., Manor place, Hale, Farnham, Surrey.

PARTNERSHIP. — WANTED, Partner, active or otherwise, in an established Masonry and Contractor's Business in Manchester, with a first-class connection; capital required, from £2,000 to £2,500; references given and expected.—Address, Mr. RIDEAL, Solicitor, 12, Brazennose-street, Manchester.

TO ARCHITECTS.—First-class Royal Academy Student desires RE-ENGAGEMENT as Assistant in a London Office.—G. H. C., 44, Finsbury-pavement, E.C.

ARCHITECTURAL DRAUGHTSMAN (first-class), requires immediate RE-ENGAGEMENT in London. Perspectives, coloured and etched (good style) well up in competition and all other drawings; good experience; specimens.—H., 82, Lamb's Conduit-street.

BUILDER'S CLERK requires a SITUATION, age 35, married, thoroughly well up in making out day-work, accounts, keeping prime cost, and the general routine of a London Office; 8½ years with present employers.—H., Mr. Browns, 195, Strand.

WANTED, a FOREMAN, with a general knowledge of the Building Trade, to take charge of the Plastering and Decorating Branches of an Old-established Business.—Address, with full particulars and references, LEWIS and SONS, Regent-street, Clifton.

ASSISTANT (Architect's), 30; thoroughly reliable; details, specifications, and superintendence; 12 years' reference; terms moderate.—B., 10, Cambridge-place, Norfolk-square, W.

MANAGER.—A Gentleman, capable of taking a leading position in an architect and surveyor's office, will shortly be at liberty; excellent testimonials and London references.—Address, "L.," 4, Cavendish-road, Leicester.

ASSISTANT (Architect and Surveyor's) desires a RE-ENGAGEMENT. Thoroughly experienced in design, details, quantities, surveying, levelling, and superintendence of works. Good draughtsman.—Address, R., Mr. Emery, 146, Belgrave-gate, Leicester.

ASSISTANT (Architect and Surveyor's General) desires RE-ENGAGEMENT at once; Working Drawings, Details, Quantities, Superintendence, Measuring up, &c., or would not object to act as Clerk of Works.—ARCHITECT, 39, Market-place, Leicester.

ASSISTANT (Architect and Surveyor's), neat and expeditious, requires ENGAGEMENT; 5 years' experience, Surveying, Levelling, Working, and Detail Drawings, Perspective, fair knowledge of Quantities; salary, 25s. per week; present situation permanency, £2 per week; good references.—H., care of Mr. Franklin, Guildhall-road, Northampton.

BUILDER'S CLERK, good Bookkeeper, Measuring up Work, Quantities, Estimating, the Preparation of Plans, &c.; age 29; 13 years' good references. A seaside town in one of the Home Counties preferred.—H. J. P., 20, Queen's-road, Watford, Herts.

TO ARCHITECTS—Mr. J. O. SCOTT, F.R.I.B.A., desires to recommend a GENTLEMAN of very large experience and practical knowledge as a leading Assistant, or as a Partner, he was for many years with the late Sir Gilbert Scott, and had the management of several of his principal works.—Address, 31, Spring gardens, London, S.W.

A GRADUATE of OXFORD, who has served articles with a firm of Architects and Surveyors, wishes to join a gentleman with good provincial practice.—Address, S. S. BROWN, M.A., Devonshire Club, Eastbourne.

LINCOLN'S INN FIELDS. — For SALE, by Private Treaty, an exceedingly Valuable FREEHOLD PROPERTY, covering a large and important area, with vacant possession.—Apply to MESSRS. BRIDGES, SAWTELL, HEYWOOD and CO., Solicitors, 23, Red Lion-square, W.C., or to Messrs. EDWIN FOX and BOUSFIELD, 99, Gresham-street, Bank, E.C.

FOR SALE, by PRIVATE CONTRACT, FREEHOLD COTTAGE PROPERTY, with arable land attached, paying good interest, well situated, and increasing annually in value; no agents need apply.—For particulars, address X., care of Housekeeper, 9, Gracechurch-street, E.C.

TO BRICKMAKERS.—To be LET, with immediate possession, a small BRICKFIELD, situated a short distance from London, near a Railway Station. It is expected that building operations will be commenced on other portions of the Estate during the present year.—For particulars apply to Mr. D. W. ASTON, Surveyor, 1, Addison-road, Kensington, W.

SHEPHERD'S BUSH.—TO MANUFACTURERS, BUILDERS, and others requiring capacious Business Premises.—To be LET on a REPAIRING and BUILDING LEASE for 80 years, direct from the Freeholder, the 2 DWELLING HOUSES, with Stabling and large Gardens, No. 1 and 2, Brunswick Villas, Uxbridge-road. The property is situate in the midst of a populous and business neighbourhood, midway between the Shepherd's Bush and Acton Railway Stations, with tram car and omnibus accommodation. The frontage to the Uxbridge-road (suitable for high-class shops) is 77 feet, the rear frontage 111 feet, and the average depth is nearly 200 feet. A plan of the Estate can be seen at the office of Mr. GEORGE LOW, Architect, 10, Basinghall-street, E.C., to whom proposals are to be sent.

MAGNIFICENT BUILDING PLOTS to be LET on the Site of the Surrey Chapel, Blackfriars-road, suitable for warehouses or manufacturing purposes, on account of its close proximity to the City; splendid lighting; extensive frontage; or the Chapel and Buildings would be let together or separately as they stand if satisfactory terms were arranged.—For further particulars apply to W. HEWSON LEES, Architect and Surveyor, 27, Doughty-street, Mecklenburgh-square, W.C.

EASTCHEAP and PHILPOT-LANE, City.—BUILDING SITE to be LET by TENDER by the Drapers' Company, on BUILDING LEASE for 80 years from Lady-day, 1881, a Corner PLOT OF LAND, with a frontage of about 75ft. to Eastcheap, and about 80ft to Philpot-lane, and containing a superficial area of about 7,500ft. The Land now forms the site of 11, 12, 13, and 14 Philpot-lane, and 42, 43, 43a, and 44 Eastcheap, the last being a fully licensed public house, known as the "King's Head." The land is situate in a most important position, on the north side of Eastcheap, and is not within the limits of deviation allowed by the Metropolitan and Metropolitan District Railways (City Lines and Extensions) Act, 1879, nor included in the Bill recently introduced by the Companies.

Tenders will be opened at a Court of Assistants of the Drapers' Company to be held at Drapers' Hall on WEDNESDAY, the 9th day of March, 1881. Forms of Tender may be obtained on application to Mr. CHARLES REILLY, 23, St. Swithin's-lane, and at the Clerk's Office, Drapers' Hall, Throgmorton-street, E.C., where a plan of the property may be seen, and any further information required may be obtained.

WEST COMBE PARK ESTATE, Blackheath (roads and sewers made, 20 minutes from Cannon-street).—100 acres of FREEHOLD LAND to be LET or SOLD, in large or small plots, according to situation. Railway Station on the property. Advances made.—For plans and particulars apply to Messrs. J. and J. S. EDMESTON, 12, Great Winchester-street, E.C.; Messrs. ISAACS and FLORENCE, 3, Verulam-buildings, Gray's Inn, W.C.; Messrs. BRISTOW, Solicitors, Greenwich; or to Mr. Z. PARKES, at the Estate Office, West Combe Park Station.

FOR IMMEDIATE DISPOSAL.—The Extensive and Complete FREEHOLD PREMISES, consisting of Residence; with large Walled in Garden, Joiner's and other Shops, Stores, Steam Saw Mills, Yards, &c., many years used for a Builder's and Contractor's business by the late R. Futcher; also the Machinery, Plant, and remaining Portions of usual Builder's Stock in-Trade.—Apply to the Executors, Fisherton Works, Salisbury.

BUILDING LAND to be LET (almost adjoining the Queen's-road station of the South London Railway).—About 50 PLOTS, either as a whole or in portions.—Apply to Mr. H. A. ALEXANDER, 72, Cannon-street, E.C.

BUILDING SITES.—ILFRACOMBE. LAND to be LET or SOLD in Torrs Park, Wilder Park, Highfield-road, Hillsborough, Langleigh, Braunton-road, Barnstaple-road, Church-road, and High-street.

MORTHOE.—Several Valuable Sites to LET facing the sea, near Barricane Beach, and close to Woolacombe.

LEE.—Good Lodging-House or Villa Sites, near the sea and in the valley.

For Marine Residences and first-class Lodging-houses; some of the above mentioned sites are unrivalled.

The salubrity of the North Devon coast, and the splendid views obtainable from many of the sites, render them of considerable value to those seeking a seaside resort.

Particulars and terms will be supplied on application to W. MORGAN ROBBINS, Architect.

Building Estates Offices, Ilfracombe.

SITES for STABLES. Portobello-road, Notting-hill.—Coach-houses, with rooms over, to LET. Good roads, pavement, and sewers. No agents.—Address: A. G., 33, Lady Somerset-road, Highgate-road, N.W.

BUILDING LAND TO BE LET, adapted for the erection of 12 Villas in the best part of Southfields, Wandsworth.—Apply to Messrs. BEAL and SON, 20, Regent-street, Waterloo-road, S.W.

EVENING LECTURES to WORKING MEN.
ROYAL SCHOOL OF MINES.

The Third Course of the Session, consisting of Six Lectures on APPLIED MECHANICS, will be delivered at the Science Schools, South Kensington, by PROFESSOR GOODEVE, M.A., commencing on MONDAY, the 28th inst., at 8 o'clock. Tickets may be obtained at the Museum of Practical Geology, Jermyn-street, by working men only, on Monday next, the 21st inst., from 7 p.m. on payment of 6d. for the course. Each applicant must bring his name, address, and occupation written on paper for which the ticket will be exchanged.

F. W. RUDLER, Registrar.

ASPHALTE.—THE SEYSSEL AND METALLIC LAVA ASPHALTE CO. (Mr. H. Glenn) Office, 38, Poultry, E.C. The best and cheapest materials for damp courses, railway arches warehouse floors, flat roofs, stables, cowsheds, and milk-rooms, granaries, tun-rooms, terraces.

UNDER THE PATRONAGE OF H.M. THE QUEEN.

LONDON PARQUETRY WORKS, Founded in 1841 for the exclusive production of HIGH-CLASS PARQUETRY. Orders received through Messrs. WRIGHT and MANSFIELD; MORANT and Co.; JOHNSTONE, JEANES, and Co., SUTHERLAND, Manchester; and by C. STEINITZ, 18, Old Quebec-street, W.; 45, Grove-lane, Camberwell; and Stratford, E. N.B.—Competitions respectfully declined.

TO ARCHITECTS.—COMPETITION and ARCHITECTURAL DRAWINGS of every description. Coloured in the first style by GEO. CHILDS, Artist, 21, Offord-road, Caledonian-road, Islington, N. Perspectives outlined by Competent Draughtsmen. Pupils required.

MESSRS. HAZELL and GOLDRING, Surveyors, 32, Theobald's road, Bedford-row, W.C., are prepared to FINANCE BUILDERS upon houses in course of erection up to £5,000 on moderate terms. Early application should be made.

THE BUILDING NEWS.

LONDON, FRIDAY, FEBRUARY 25, 1881.

DISLOCATION IN DESIGN.

ONE of the many points dwelt upon by Professor Street in his opening lecture at the Royal Academy, reported in full in our last issue and again to day, was the importance of relation in the design and sketching of features. Coming from so able an exponent of the Gothic School, the advice seems to possess more weight than if an authority on the opposite side had inculcated the same doctrine, and we think, on this account, it deserves the attention of all, particularly those who are ready and willing to learn.

In a recent article we had ourselves remarked upon the absolute duty of the architect to make the parts and features of his building bear some sort of relation to the spectator, more especially with reference to the height and scale of mouldings and carved ornament, light and shade. In competition designs one is accustomed to see a most flagrant disregard of this kind of architectural adaptation; but when one comes to see actual buildings carried out upon a system of hetercogeneous patchwork with big and little, coarse and refined features, mixed together without scale and with no pretence to method, we might almost imagine architecture to have sunk into hopeless degeneracy. With some architects this laxity of method seems habitual; they seem to have imbibed their architectural knowledge from the scrapbook, and to have looked upon the parts of great buildings somewhat in the light of a disjointed puzzle. It is all "bits" with them: there is no idea of design as a work of synthesis, certainly none of connection or coherence. No conception or central idea runs through their compositions, except when they boldly copy some other building. We believe this weakness to be largely due to the manner in which students make sketches of old buildings, and Professor Street has happily pointed to it in speaking of sketching. "Remember always," he says, "that sketches of mouldings alone, without equally accurate sketches of the features to which they belong or with which they are connected, are useless." The same remark may, with equal force, be applied to every separate or isolated feature of a building. With respect to mouldings, there is a common idea that anything will answer the purpose of one if it is made to project, and is divided into parts. Its height above the eye, its vertical dimension, and its projection, are all important; but the size, number, and contour of the members are paramount considerations to the designer who has any desire to make people respect the work as the evidence of design. In nature, plan and purpose are visible throughout every object, and the argument from design has been pressed into service by philosophers and theologians; in architecture the argument, we fear, would rather confound and perplex any future architectural anti-Darwinite who used it. The want of relation and connection between mouldings and their positions, is not the only or even the most palpable form of the disjunction or dislocation of features. More than once lately we have drawn attention to the sculptured decoration of new buildings, and have protested against the meaningless procedure of sticking copies of Renaissance artists' work in positions the originals were never intended to occupy. Professor Street, referring to this point, attributes the fault to its right origin. He attaches little importance to drawings of ornament or sculpture made from casts in schools. The pupil sketches them as objects close to the eye, and, losing sight of their original connection in the edifice, is wont to introduce them as ornament in various parts of buildings, regardless of position. No better advice can be given than that "all architectural features in which carving is introduced ought to be looked at and drawn in the very place for which they are intended." Instances occur to us of bosses and string-courses carved by the Mediæval sculptor for the aisle of a church, which we have seen made to do service in a clerestory considerably above the eye, where one would only look for the indication of a bold leaf or some vigorously expressed features. How useless and wasteful of skill and labour it is to put the same amount of detail and elaboration in a piece of carved work which will never be seen, and another piece fixed close to the eye, it is needless to prove by argument; yet architects are constantly doing it, and the carvers are not always conscientious or skilled enough as artists to use their discretion. The habit of seeing things in one's mind as they will be seen *in situ*, though so important a matter, is singularly lost sight of. With one class of artists, neatness is a magnified virtue everywhere, and equal care is bestowed in the carving of the bands or finial of a spire as in that of a font or pulpit. Excellent as a quality, these artists are led into a rather mistaken belief of the omnipresent power of fine carving, without the reflection that the same amount of labour may be profitable in one place and thrown away in another.

Many of the most conspicuous failures in architectural design are owing to the neglect of realising in the artist's own mind the effect of a building when erected, and the value of perspective is mainly its use in enabling us to detect any fault or blemish in the conception, either in its composition or light and shade. For this reason we are glad Professor Street enjoined upon the students of the Academy the importance of the power of perspective sketching, and in picturing in their minds the result of any design. It is necessary, however, to point out that there is the art of "tricking up perspectives"—a practice largely resorted to by experts who are paid for making perspective drawings as attractive as they can, and that this art of making a design captivating is a very different art to the perspective sketching which the lecturer advocated, and which rather exposes the defects and want of proportion of a design, enabling its author to remedy them before too late. Perspective, to be of use, must be a truthfully correct representation of facts, not an artfully prepared picture; it should be rather the tentative means to an end, not the imaginary end—a drawing put forward to misrepresent the reality. But the truth is the competition architect uses the art in quite another way; he does not often trouble about making a perspective himself, to satisfy and solve any doubts in his own mind; but he gets an artist to make one for him, and this is done to conceal defects, and not till after the actual designs, and all the drawings have been prepared. Let young architects learn this art for its own sake, and the power it gives them to design artistically and comprehensively; and let them resolutely eschew the practice of making drawing a false vehicle of design, and they will soon begin to appreciate the power of coherent compositions and the importance of conceiving everything by scale and from a true standpoint.

THE WATER QUESTION.—III.

WEIRS in rivers serve three useful purposes: they create a head of water for the working of mills, they facilitate the navigation, and they hold up the water in dry seasons within the reach of the roots of plants, and promote vegetation in the adjoining lands. They are so numerous and useful for these purposes that they cannot, with any regard to commercial and agricultural economy, be done away with; but many of them are of extremely rude and uneconomical construction, and as long as they remain so they offer a standing subject of dispute amongst the varied interests in a river basin. Some of these badly-constructed and inefficient fixed weirs might be advantageously replaced by movable weirs. These consist of doors hinged horizontally under water, and can be lowered so as to lie flat on the bottom of the river, and allow flood waters to pass over them, being raised again on the subsidence of a flood by chains and machinery to keep up the head of water in ordinary times; and in rivers of shallow water they afford a means of navigation. But the passage of floods can be sufficiently well provided for by means of fixed weirs provided with sluices, to be lifted vertically by rack and pinion, or by a crab travelling overhead along the line of sluice-gates, whereby a part of the water is passed off underneath.

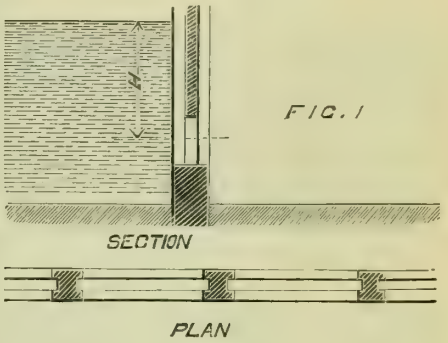

FIG. 1

The quantity of water which can be passed off in this way, and the height to which any given volume of water will rise against the sluice-gates, with any given opening, may be found approximately thus:—

Let Q be the quantity in cubic feet per second;
L the aggregate length in feet of all the openings;
H the height in feet to which the water will rise above the centre of the openings—supposing all the gates to be drawn to the same height, and that their sills are all on the same level;
and h the height to which the gates are drawn;

Then, $Q = Lh \times 5\sqrt{H}$,

and $H = \left(\frac{Q}{5Lh}\right)^2$.

In this case the form of the sluice-openings is taken to be of the ordinary abrupt

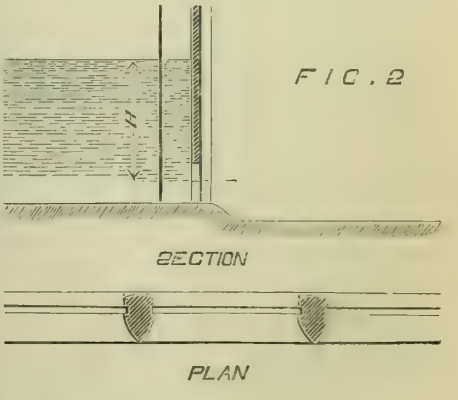

FIG. 2

construction shown in Fig. 2, where 5 would be the constant multiplier proper to that form. If the openings of the gates be 20ft., the sill 6ft. below the head of water, and the gates be drawn 2ft., the head H will be 5ft., and the quantity of water passing through in cubic feet per second will be approximately $Q = 20 \times 2 \times 5\sqrt{5} = 447$.

But by making a floor, extending upstream 8ft. or 10ft. from the sill upon which the gates shut down, and on the same level as the sill, and by forming the sides of the openings in curves approaching the form of the "contracted vein," the proper constant becomes 7 or thereabouts, and the quantity will be approximately as follows:—

FIG 3

SECTION

The openings of a sluice thus formed are 20ft. wide, at the end of a weir 100ft. long. When the gates are drawn 2ft. the water stands level with the crest of the weir, 6ft. above the sill of the sluice, and the water in the pool below stands nearly up to the level of the sill. The quantity of water which may be expected to pass through the sluice in cubic feet per second is—

$$L h \times 7\sqrt{H}$$
$$= 20 \times 2 \times 7\sqrt{5} = 626.$$

If the level of the water below the sluice is not wholly below the opening, as it was in the latter case, the head H is to be reckoned as being the difference of level between the surfaces of the water above and below the weir. When there is a depth of 15in. going over the weir, the water in the pool below is, *e.g.*, found to stand in a sheltered place 3·75ft. below the crest of the weir, and the sill of the sluice is 6ft. below it. The gates remain drawn 2ft. as before.

Under these circumstances the approximate quantities of water which may be expected to pass through the sluice and over the weir respectively, are as follow, in cubic feet per second, the depth (d) being 1·25ft., measured from the crest of the weir to the surface where the water is comparatively still:—

Through the sluice $Lh \times 7\sqrt{H}$ $= 20 \times 2 \times 7\sqrt{5} = 626$	1,091
Over the weir $3\frac{1}{3}\sqrt{d^3} \times l$ $= 3\frac{1}{3}\sqrt{1{\cdot}953} \times 100 = 465$	

Although the circumstances of the passage through the sluice now are different to those of the former case, yet the quantity (626) appears the same, because the head is the same, viz., 5ft., in both cases, although the opening is in one case covered and in the other not so. With regard to the constant multiplier $3\frac{1}{3}$, it is derived from the coefficient ·625, which is taken to be the proper coefficient found by many experiments on the flow of water over weirs, and, from amongst the numerous coefficients so found, to be the most suitable to the circumstances of this weir. It indicates as the practical quantity $\frac{5}{8}$ths of that which would be due to the abstract law of gravity, or the theoretical quantity which would be represented by $\frac{2}{3}$rds of 8—neglecting a decimal of from ·02 to ·04, 8 being the square root of twice the force of gravity, or twice the velocity which a falling body has acquired at the end of the first second of its time of descent, and which, applied to water as to other falling bodies, is the fundamental law of all hydraulics; and the velocity of falling water varies as the square root of the height from which it falls, and the height from which the lowermost particles of the sheet of water going over a weir fall is the height from the surface of the water above the weir, where it is comparatively still, down to the crest of the weir, and as the velocity of the particles at every point in the height decreases upwards as the square root of the depth below the surface, the mean velocity of all the particles of the sheet of water is two-thirds of that due to the lowermost. If the sheet of water falling over a weir be 1·25ft., or any other depth, the velocity due to the lowermost particles is $8\sqrt{d}$, neglecting a small decimal of from ·02 to ·04; but the mean velocity of all its particles from bottom to top is only two-thirds of this, or $5\frac{1}{3}\sqrt{d}$, by the abstract law; and practically only about $\frac{5}{8}$ths of the quantity of water which this would represent passes over a weir of the form of that which has been referred to; and over no weir whatever does it much exceed $\frac{5}{8}$ths: in many weirs it is less. The constant $3\frac{1}{3}$ then, is thus derived, being $\frac{5}{8}$ths of $5\frac{1}{3}$, and applies to measurements in feet, and to the duration of one second of time.

Feet measurements, taken in hundredths, are better than inches, but not always convenient; and when the depth of water going over a weir is measured in inches, the constant $3\frac{1}{3}$ should be divided by the square root of the cube of 12, = 41·56; but then, when depths are not great, it becomes better to estimate the quantity in cubic feet per minute instead of per second, and in this case $3\frac{1}{3} \times 60 = 200$, and $\frac{200}{41{\cdot}56} = 4{\cdot}81$, the constant multiplier for these measurements: it is less than is sometimes adopted, and presupposes the water above the weir to have no velocity of approach, but to be still or nearly so; it is, therefore, subject to be increased where the water has a current in approaching the weir; the constant 5 or 5·1 is frequently applicable; and, indeed, for accuracy, every weir requires a careful study of its circumstances, and an equally careful examination of the results of experiments made under similar circumstances.

It may frequently be seen on rivers that weirs are aslant of the stream, as in Figs. 4 and 5.

FIG. 4

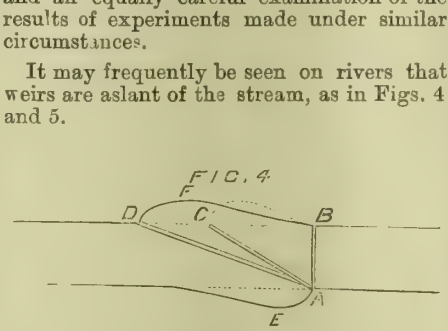

FIG. 5

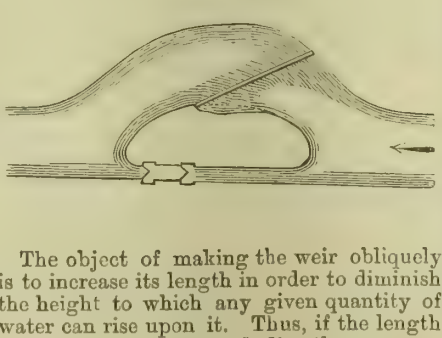

The object of making the weir obliquely is to increase its length in order to diminish the height to which any given quantity of water can rise upon it. Thus, if the length (l) of a weir constructed directly across a river, as from A to B, Fig. 4, be 100ft., and the quantity of water coming down the river be such that it rises to a height (h) of 4ft. above the crest of the weir, the proportional number representing the quantity passing over would be 800, being $100 \times 4 \times \sqrt{4}$, or $100\sqrt{4^3} = 800$. If the length be made 200ft., as from A to C, the height would be $\sqrt[3]{\left(\frac{800}{200}\right)^2} = 2{\cdot}52$ft., and if the weir were made 300ft. long, as from A to D, the height would be $\sqrt[3]{\left(\frac{800}{300}\right)^2} = 1{\cdot}92$ft., and therefore, for the same elevation of the weir's crest, the height to which the water would rise above it in this latter case would be $4 - 1{\cdot}92 = 2{\cdot}08$ft. less than if the weir were placed directly across the stream. But there is a practical point to be attended to in these oblique weirs, which does not arise in the other case.

In approaching the weir the particles of water take a curved direction, tending to meet the line of weir at right angles, and the effect of this is that the bank below the weir at its upper end is worn away unless it is protected, and the proper form of construction is a curve as at E; and, further, when a weir is thus placed obliquely, the water has a tendency to run along the foot of the weir on its upper side and to wear it away; and to prevent this the bank should be curved out on the upper side at the lower end of the weir, as at F.

EDIS ON DECORATION AND FURNITURE.*

THERE are two ways in which different people will be likely to judge of the present work: by considering the principles advocated in it, and by looking at the examples which are given to illustrate those principles. To take the examples first, and those examples chiefly which show various modes of architectural decoration for houses, we cannot help noticing the strong light which they throw on the better and worse sides of the revived Semi-Classic. Never before, perhaps, have modern architects worked in a style which so frankly admitted itself to be a mere fashion, like the fashions by which dressmakers and milliners lead women captive at their will. Never before, perhaps, have they so cynically abandoned all pretence to reason, truth, or beauty as "motives" for detail, and relied so unblushingly on the mere novelty and popularity of the forms they adopt. On the other hand, they have never before attempted so fully to deal with the difficulties of domestic architecture, and to treat furniture, house-decoration, and secular art-work of all sorts in a characteristic manner, and not in one which is a mere echo of the great monumental styles. In Mr. Edis's book we can see numberless instances both of the good and the bad of the treatment in question. Such a book will long remain a valuable and suggestive contribution to the literature of house-design; but we fear it will not be long before the permanent in it will be somewhat hidden, to ordinary readers, by the decay of the temporary. The more pronounced a fashion is the more ridiculous it looks when it has ceased to be the fashion; and it is conceivable that a time may come when the style of architecture which Mr. Edis affects may seem as ill-chosen for the purpose of enhancing the beauty of his ideas, as the style of dress which the Queen Anne ladies affected was ill-chosen for the purpose of setting off the beauty of their faces. So much it is right to say to the shortsighted people, if there are any, who mistake the starting-point for the goal, and who think that the revived Semi-Classic, as it stands, is a perfect style, instead of being a mere rubbish-heap out of which some valuable elements of a style may by degrees be picked. That Mr. Edis

* Decoration and Furniture of Town-houses: a series of Cantor Lectures delivered before the Society of Arts, 1880; amplified and enlarged by Robert W. Edis, F.S.A., F.R.I.B.A., architect. With 29 full page illustrations and numerous sketches. London: C. Kegan Paul and Co., 1, Paternoster-square. 1881.

is not of this number it is needless to say; he clearly looks at the present style-fashion as something to transform and perfect, not to rest in. We ought to state, too, that only a minority of the illustrations represent designs of his own, though the greater part of them are in one phase or another of the style which we have referred to.

The most interesting part of Mr. Edis's work to architects in general is perhaps that on floor, wall, and ceiling decoration. Much of this relates to what may be done by way of improvement to existing houses. Mr. Edis first discusses the cutting away of old stone floors in halls and passages for the purpose of laying above them marble or tile pavements. This, as being troublesome and costly, not to say dangerous, he does not advocate. Neither does he recommend the use of those very inartistic materials, oil-cloth and linoleum; but suggests several modes of treatment which would be fairly good. Thus the stonework may be kept white and used as a border for warm Persian or Indian rugs; better still, its margin may be painted a soft brown, or other suitable colour, to keep away damp and dirt; or, again, it may have a border of incised lines filled with coloured cement. In addition to this border the stone may have a large square or diagonal pattern of incised lines all over it, with small red or black tiles at the junction of the lines, or more expensively, it may have borders and patterns of inlaid marble slips. The paving, again, or marble mosaic may be laid over the stonework, and the additional height gradually champered off towards the doorways. Mr. Edis, we are glad to see, advocates a large proportion of quite plain tiling, instead of the wearisome decoration of every square inch of flooring which the manufacturers' pattern-books always show us. The same principle he insists on here, might with equal wisdom be applied to wall-surfaces, and even when we have found the best wall-papers that can be bought for money, it would be a wonderful relief, in most cases, to use them sparingly, and as a mere contrast to prevailing patternless spaces. This, however, is an advance which remains for the future, for most people at present do not think their principal rooms half finished as long as there remains a yard of patternless space to give a momentary repose to their eyes and brains. Mr. Edis, after discussing the floors of halls and staircases, proceeds to those of rooms, and goes into the relative merits of borders painted, stained, and parqueted. Next follow several pages on external coloured decoration, by way of brightening up our dreary stuccoed streets. The great difficulty architects have to contend with here, and everywhere else in the simpler class of coloured ornamentation, is that of getting their ideas carried out. Experience leads one to think that from some mysterious reason every man who has a colour-blind son, hastens to apprentice him to a house-painter: and no amount of practice ever enables the apprentice, in after-life, to execute an architect's design within a dozen shades of what it ought to be. No architect can afford to stand over a house-painter all day long; and very few such painters can be trusted to go on rightly any longer than an architect is touching them, supposing, that is, that the colours they are using are in the smallest degree uncommon; so that, as the final result, architects are afraid to use anything that can be termed colour at all.

Mr. Edis afterwards takes up the question of internal-wall decoration, mentioning in succession the Burmantofts *faïence*, tapestry, flock, and other wall-papers, including those stamped after the manner of leather; the so-called "Muralis," various kinds of painted tiles, and wood veneering. Friezes with figure-subjects, and also with birds and flowers, of course, come in for prominent notice. The latter, with the naturalistic treatment proposed for them, strike us as being out of harmony with the highly-conventional forms of the "Queen Anne" and Jacobean styles. "Naturalism," however, which in practice means copying the skin-deep forms of nature, and missing its all-pervading life, is having its day; and those who are heartily sick of it need only rejoice when it is so used that others are likely to be sickened of it also. In the matter of ceilings, Mr. Edis gives some very good advice; discourages figure-subjects, even apart from their expense; points out the danger, in existing houses, of using colour so as to make the bad plaster details even more offensive than they are, and seems to prefer delicate tints with some use of stencilling, and a slight picking-out of mouldings.

Having given, in outline, a brief abstract of one chapter, we can only indicate the subjects of the rest. They deal, in greater detail and minuteness, with the various portions and apartments of the house, such as the entrance-hall, the staircase, the dining-room, drawing-room, library, and boudoir, and the bedrooms, nurseries and offices. On all of these subjects there are a multitude of valuable suggestions, and a very complete account of the various materials and systems amongst which an architect may choose. There is a useful chapter on furniture, and another on such things as pottery, porcelain, glass, metal-work, locks, door-plates, and window-blinds. Of all these items there are illustrations; the examples are good of their kind, and as the makers' names are in all cases given, even those purchasers who know least of art workmanship can ascertain where their money may be safely expended.

TEN YEARS' EXPERIENCE IN INTERMITTENT DOWNWARD FILTRATION.*

MR. J. BAILEY DENTON, C.E., has just published the results of his experience in works of "Intermittent Downward Filtration," and a perusal of the facts brought forward will, we believe, remove many of the objections which opponents to that system of utilisation entertain. Mr. Denton fairly takes these objections to task, and, as far as we can find, shows that they are founded on imperfect views of the conditions required for a successful application. One of the most indispensable of these is that intermittency of application is necessary, even in "suitably constituted soils," and another, that under-drainage be adopted. The most desirable soils are obviously those partaking of the character of a sandy loam, and, therefore, to apply the system to dense clays, improperly prepared, is an unfair test of the capabilities of filtration. There is no doubt, also, that intermittent filtration has been unjustly tested by the ordinary rules applied to surface irrigation, the principles of which are based upon a very different treatment. The author in his introduction, classifies the towns and villages according to the nature of their outfalls, and while he shows that sea-board towns may, after some cleansing process, reasonably discharge their sewage direct into the sea, towns situated on estuaries and tidal rivers, and inland towns generally, can only effectually get rid of their sewage, having regard at the same time to the standard of purity suggested by the Rivers Pollution Commissioners, by having recourse to surface irrigation, or intermittent filtration. No doubt it will be said that towns so located cannot always command the area of land suitable for this treatment, and that some mode of chemical precipitation is necessary. Yet it may be affirmed from experience, chemical processes have neither been remunerative, nor altogether successful as a purifying means. Respecting drainage, we need only mention the case cited by Mr. Denton, of the unfortunate site selected at East Moulsey for the Lower Thames Valley sewage, the disadvantages of which are pointed out.

Replying to the objections urged by some to intermittent filtration, such as the clogging of the soil, and its consequent loss of absorbing capacity, the nuisance arising from a limited area being so treated, and the cost of preparing land for the process, Mr. Denton instances the case of Merthyr Tydvil, which was the first experiment made to show that these objections are not valid. Instead of taking one acre of suitable soil, drained 6ft. deep, to cleanse the sewage of 3,300 persons, as suggested by the Rivers Pollution Commissioners, three acres were taken to do the same duty, and the sewage was distributed by furrows; so that the doubts entertained by the commissioners were met. Later experience seems to have shown that the anticipations formed by Dr. Frankland and others were well founded, and that as regards the quantity of land required to insure economical results, it was a simple matter of the quality of the soil, its capability of absorbing the sewage at stated intervals, and of retaining its oxidising power. It has been found, indeed, that free porous soils cannot be overcharged with liquid. Mr. Denton says "If we avoid the denser clays as altogether unsuitable (unless they are so altered by mixing, burning, &c., as to lose their natural character), and regulate the application of the sewage to other soils, within the limits of 1,000 persons to the acre of those most suitably constituted, and 250 persons to the acre to those least suitably constituted; all other descriptions of cultivatable land may be made capable of filtration, and the advantage of being able permanently to cleanse the sewage of a district where any land, more or less suitable, is to be purchased or leased in sufficient quantity to meet these limits, cannot be overestimated."

Passing over a few useful sections dealing with the amount and value of sewage, solid matters, and sludge, temperature of sewage, storm overflows, and suitable soils, we come to numerous instances of application. The Merthyr Tydvil works, and the results, are described in some detail, and the author quotes figures and facts to prove that much that has been said about that noted case does not bear investigation. At Kendal, in Westmoreland, the author has applied the same system successfully, though, instead of limiting the sewage of 1,000 persons to an acre, the Council used only one-third the land recommended, which, of course, has unfairly tried the process. At Forfar, in Scotland, the process has been applied in combination with surface irrigation, and the receipts of the farm produce speak for themselves. At Great Malvern, surface irrigation and intermittent filtration have also been successfully combined. Halstead, Essex; Barnsley, Yorkshire; Hitchin, Oakham, and the Convalescent Hospital, Walton, Surrey, are among the other instances cited, and they afford convincing proofs that, even under unfavourable circumstances, intermittent filtration can be used with decided advantages, and that clogging of the soil has not been proved. The plans and estimates of the farms given, and the experiences and notes recorded at the end of Mr. Denton's book are valuable, and deserve study.

* Ten Years' Experience in Works of Intermittent Downward Filtration, separately, and in combination with Surface Irrigation. By J. Bailey Denton. E. and F. N. Spon, Charing-cross, London.

ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of the Association was held on Friday evening, the President, Mr. E. C. Lee, in the chair. Messrs. H. B. Thorpe, J. L. Kingham, G. Maides, J. Holdgate, W. J. Hilton, J. U. Quick, T. W. Abbott, R. Donaldson Hawes, and F.

Slaiter were admitted as members. Mr. Eales proposed a vote of thanks to Mr. T. Roger Smith for meeting the members at the Consumptive Hospital, Hampstead, and explaining its details of construction, and announced that the next visit would take place on Saturday, the 26th inst. (to-morrow), when the members would assemble at 3 p.m. in the new board schools on the Queen's-park Estate, Harrow-road.

THE ASSOCIATION'S EXCURSION TO LOMBARDY.

Mr. E. J. Tarver read a paper descriptive of the excursion to Lombardy, conducted last autumn by Mr. Hugh Stannus. The lecture was cast in diary form, and was avowedly of a general and gossipping character, the author suggesting that details could be filled in by other members of the party. A number of drawings, including plans, elevations and measured details of the principal churches, rubbings from monuments, and full-sized details were hung round the rooms. These illustrations represented the joint work of the members, executed under the supervision of Mr. Stannus, and subsequently arranged and pieced together by him; they were supplemented by drawings lent by Mr. Hilton Nash and others, and by photographs, the whole forming a very interesting exhibition of Italian Renaissance architecture. The party, Mr. Tarver mentioned, consisted of twelve members, and the route taken was viâ Calais, Paris, and the Mont Cenis Tunnel to Turin, that city being reached on Saturday, the 18th September last. The low pitch of the roofs and the overhanging eaves, together with the intensity of colours, and the clearness of the shadows, at once reminded the party that they were on the southern side of the Alps. It was commonly asserted that the alterations of roof pitch as one went south was a question of turning off rain; but as there were driving rains in Italy, he thought the reason was rather that with a flat pitch it was easier and more economical to obtain the large projection of eaves which alone made street-life, in the heat of the day, endurable, and this accounted for the covered arcades in the principal streets. A visit was paid to the new Jewish Synagogue, with its enormous coved and truncated roof, square on plan, and its numerous superposed orders of columns; the effect was rather "spindly." In the afternoon they went on to Milan. A grand central feature of the town was the Gallerie Vittorio Emmanuele, a gigantic promenade roofed with glass at a height of about 80ft., and containing the fashionable shops and restaurants; its architect, Mengone, like our Bassevi, met his death by a fall from the roof. The lecturer suggested that our Trafalgar-square might with advantage be covered in and treated in similar fashion. The Palazzo Municipale was, according to Mr. Stannus, correct in its proportions and details, and its cornice exhibited a feature peculiar to Milanese work; but Mr. Tarver thought it monotonous. If anything could have given Milan Cathedral a chance of looking well it should be moonlight; but although they selected that for a first view, it seemed to the visitors frivolous and wedding-cake-like externally; inside, as seen next day, the huge pillars in a long cross-row gave an Egyptian effect. In the church of Santa Maria presso San Celso, they first saw some of Bramante's work. It has an apsidal east end with ambulatory, the planning being as irregular as any Northern Gothic work, but the result classically quiet and steady. As seen during the excursion, Bramante seemed to have treated Renaissance architecture with just the proper amount of playful freedom and no more, and to have always worked within his power. Alberti's work appeared, in comparison, quite "stodgy," and that of later men, with their twists and curves, both in elevation and plan, quite licentious. In Italian domes, the great feature was the management of the piers. A dome of large size could not stand comfortably on square piers; on the other hand, an octagon of equal piers and voids produced a very tame result, and it was interesting to observe the stages between these extremes. In our own St. Paul's Cathedral, he thought the effect was marred by the segmental arches alternating with the four great semicircular arches. In the gorgeous church of San Alessandro, Milan, he roughly noted the plan, which was at once powerful and interesting, but had apparently never been published. Its principle seemed to be that, having settled the diameter of the great dome, the faces of piers were drawn from the points where diagonal lines touched this diameter. Two large columns—one circular, the next square—gave extra stiffness to the piers, and carried the four great semicircular arches; but all the rest of the church followed either the diameter of great dome, or the width between these diagonal points. These piers gave just the right amount of support, and the pendentives came together comfortably at the springing line. The great dome was raised on a drum, and was further helped by a second impost on springing mouldings above the main cornice, which would otherwise have concealed too much of the arches as seen from below. The interval of rest given by the barrel-vaults, the subordination of the flat dome over the choir, and the still further subordination of small side domes, and their surrounding barrel-vaults, produced an ever-varying and picturesque composition. The terra-cotta treatment of the Ospedal Maggoire had been often illustrated. No Northern architect would have designed the windows with head and jambs surrounded by an unbroken border of ornament; he would, perhaps rightly, have emphasised the spring of the arch with a capital or other break. The plan of this hospital was a central courtyard, with four smaller courtyards on each side, the enormous wards forming the division between the nine courts. On the following day, Mr. Stannus piped all hands to measure the cleverly-planned church of San Satiro, the drawings being subsequently put together under his direction. At mid-day they took train for the well-known Certosa, a monastery of the Carthusians, now under the charge of the Italian Government. In the buildings space had been economised in a complete manner, but without producing a sense of cramping. The church was partly under repair, so that they were unable to examine some portion. The whole was so rich as to baffle description. As an architectural composition, the nave front was shocking; but one could revel in examination of its every detail. The best features of the choir were the backs of the stalls, ornamented with wood inlay, said to have been designed by Borgognone. At Pavia, the next town visited, the party found themselves amongst Mediæval arcaded streets and market-places, and close to their hotel, an enormous octagonal building was in course of erection; it was to be a covered promenade, but would make a respectable domed church. The unfinished cathedral of Pavia, designed by Bramante, was most instructive. A wooden model of the completed church and engravings showed what a stupendous effort it was; but he thought the treatment of alternate arches of the dome, carried up a stage higher than usual, would produce a weak effect. The top stage of the tower exhibited Bramante's restraint. The Church of S. Theodore contained some fine frescoes on the north and south walls of the transept. The former was divided into twelve squares, containing representations of the patron saint's life, and at the bottom, one long panel with a row of figures under a continuous canopy and figures at a table in the centre—an arrangement binding the whole series well together. Those on the south side represented the life of St. Agnes, and were far finer, the only fault being that the drawing was a little too formal. The church of San Michele was an unusually rich example of the Lombardic style. At the water-girt and ague-haunted town of Mantua they visited first the large church of San Andrea, one of Alberti's designs, and rigidly clean-cut and proper in its lines. The desecrated church of San Sebastian has an external staircase with a double arcade of exquisitely refined character. The Ducal Palace Thé consisted of a series of rooms designed and painted by Giulio Romano; one had full-sized figures of horses on the walls, and marvellously foreshortened figures on the ceiling, tier above tier; a third had walls and ceiling in one continuous unbroken surface, painted with the Fall of the Giants. The next day was one of hard work at Verona, a route having been strictly arranged by Mr. Stannus, embracing all the important buildings. They began with the outlying 12th-century church of S. Zenone, one to which the mind gratefully reverted through the daze of all the Renaissance work seen during the trip. At San Bernardino there was a circular baptistery, the Capella Pellegrini, by San Micheli; but it was very inferior to Bramante's baptistery at San Satiro, Milan. The cathedral was also a Mediæval church of the 12th or 14th centuries. The church of San Giorgia, on the other side of the river, was an oppressively grand design; it contained a large altar-piece by Paul Veronese, representing the martyrdom of St. George. At Sta. Maria in Organo was much inlaid woodwork in the choir, but although ingenious, it represented only inanimate objects, and was not to be compared with that at the Certosa. They obtained leave to visit also a very early chapel, excavated in a hillside, and decorated with contemporary frescoes; another church, S. Fermo Maggiore, was interesting for its single-span roof and its pulpit. He was disappointed with the Scaliger tombs, and were it not for the Gothic mania no one would have been excited by them. Last of all they visited the Roman arena, which transported the members into quite another world from Verona. Friday, Sept. 24th, was the last day, and on it they were to fulfil at Brescia one of the chief purposes of the excursion—to secure a monograph of the Church of Sta. Maria de Miracoli. Before attempting this the members visited the two cathedrals, new and old, standing side by side, and connected by a passage. The new one is on an enormous and costly scale. The old cathedral was a circular church of the 12th century, on a 9th-century crypt. The Palazzo Municipale was an unfinished building, and was designed by Bramante, begun by Fomentone, the second story carried out by Sansovino, and added to by Palladio, there still being an opening for a modern architect in the completion of the octagonal top story. The afternoon was well spent in the measuring up and drawing the Miracoli, and in the evening the party broke up, some going to Venice, and others returning by the St. Simplon and Gothard routes for Paris—all that he could answer for being his own return to England at the time laid down in the prospectus, and within the expense that Mr. Stannus had named.

Mr. G. Crickmay, jun., of Weymouth, read a supplemental paper, describing the trip to Venice undertaken by a few of the party, in which he dwelt upon the peculiar character of Venetian Gothic and Renaissance, and upon the beauty of their colour decorations, and suggested that the Association should arrange for a special excursion to this most interesting city.

The President, in inviting discussion, remarked upon the value to young architects of excursions into Italy for purposes of study and comparison of actual buildings.

Mr. Longden, one of the members of the party, said he was struck with the free and bold use of colour in external decoration, but thought it was only permissible in the brilliant sunlight of Italy. The ironwork was differently applied to that which we were accustomed, but was excellent in its details; in Lombardy flat strips of iron were largely used for ornament, in combination with square pieces and bars. A typical example was that surrounding the tombs of the Scaligers. In several churches, as at the Certosa and S. Maria del Organo, they saw wood used as an inlay. He passed high encomiums on Mr. Stannus for the excellent manner in which he arranged and carried out the excursion.

Mr. Gill also referred to the varied use of colour decoration seen in Lombardy, as in the frescoes at Brescia; the blue, red, and yellow used there appeared grey in the shade and at a short distance. Much of the Rococo decoration added to earlier churches, as at San Michele, Brescia, was very bad. In Bramante's unfinished Cathedral at Pavia they saw that the nave triforium had been continued in monochrome over the flat wall surfaces of the unfinished transepts.

Mr. Stannus explained that his object in planning the excursion was to show the students the beauties of Renaissance work as carried out in Italy, and that Gothic was not the only available style, and he thought it had not been an unsuccessful effort. He described the mode in which the measured drawings and plans were executed by a combination, and added that it had not yet been decided whether the results, with some additional notes, should be published in a separate form or in one of the architectural journals. He threw out the suggestion to the members that in future the Association excursion, instead of being confined to our own country, should be in alternate years extended to the Continent, the intervening year being devoted as now to an outing in England.

Mr. R. P. Spiers seconded the vote of thanks to the readers of the papers, which had been proposed by the last speaker, and added to it the name of Mr. Stannus for having inaugurated and organised the excursion, and thus amplified, the motion was carried by acclamation.

THE STUDY AND PRACTICE OF THE ART OF ARCHITECTURE.*

(*Concluded from page* 174.)

THERE is no subject for study more important than the relation of carved ornament to architecture. You know how in all times it has formed a leading feature. The repetition of definite ornaments at regular intervals is one of the easiest modes of securing due attention to the member on which it occurs. The moulding adorned with carving is always more noticed than any other, and the lines which require special emphasis are those to which such work ought to be confined. You will soon find that these carvings, as well as the mouldings, are modified to suit their positions, near or at a distance from the eye. You will notice also certain contrasts between the ornament in good and bad work. In the former it is never aggressive or too prominent; in the latter it is almost always so. In the former it is used with due deference to the common sense of construction; in the latter it disregards the construction entirely. I cannot give you a better example of this than is afforded by the division of such an enrichment as the so-called dog-tooth flower. In good work this is always divided to suit the joints of the stonework; in bad work it is set out with absolute uniformity all round an arch without any reference to the joints, which thus, instead of coming always between the flowers, occur in the worst possible places. I mention these points because, if you once notice them for yourselves, you will see how important they are, and how certainly they indicate the quality of the work in which they are found. As there is no sort of training for an architect equal to that of the study of buildings, so it is absolutely impossible for you to learn your art only from the lessons which are able to teach you here, or which you learn in the routine of architects' practice. At all costs, then, you must spend a certain proportion of every year in travelling and examining buildings for yourselves, and the only special advice I can give you now is, not to try to cover too much ground at first. It is wiser to study a few good works well, and to make yourselves thoroughly masters of them. Having done this for some time you will find your power of seizing the best points in the buildings you visit increase rapidly, and you may then make your journeys more rapid and less exhaustive and particular. These very general suggestions may seem almost unnecessary; but unfortunately I know from experience how few of us spend enough time in sketching and measuring existing works; and how few manage to make clean, clear, decided sketches of what they see. Observe that it is generally impossible to improve a sketch after it is once made; whatever it is, pray leave it with all its first freshness about it. There is a virtue in that which will never be increased by after-work. If you have any feeling of the artist in your composition it will be impossible for you to go on for long drawing the good work of other men or other times without gradually finding yourselves distinguishing clearly between good, inferior, and bad work. In this country it so happens that you all have, within reach, examples of a national architecture perhaps as noble, and certainly as universal in its developments, as that of any other land. Some of you, as you pass through our schools, give painful evidence of the fact that you wholly ignore this great,—indeed, untold,—advantage. Compare your own chances of education with that of the student whose fate has ordained that he shall learn all that he knows in new countries, where not a fragment remains of an older art than that of his own time, and you will see how immense your advantages are compared to his, and how far in advance of him you ought to be in real taste and culture. But I am told, sometimes, that you have no time, no opportunity, no means to avail yourselves of your advantages; and when I ask one who excuses himself in this way whether he has drawn much of Westminster Abbey, or of the cathedral nearest to the town from which he comes, I find that he has deferred this duty to some future day, or that he thinks the advice too impossible to be practicable. Others among you, too, may believe what you are often told, that what you should aim at is an original style, and that the constant study of already executed work is not likely to assist you in this. Well, this is too long a question for this evening; but if the nineteenth century is to distinguish itself by not caring for all that has gone before, I can only say that it will distinguish itself in a quite unique fashion. I shall have to speak to you more at length on this point in my third lecture, and need, therefore, only say here that we know of no period in our art in which architects were not studying the work of men who had gone before. They studied them wisely, so that they might improve them. The variations which they made were sometimes so slight and so slowly made as hardly to amount to variation at all, and if there ever was a people more prone to such a course than another it was that Greek nation to whose art we all look up as among the most inspired results of the highest training. I would never have you draw and sketch existing examples with a view to copying or reproducing them. That is wholly contrary to right principles. What I wish is that you should draw so much of them as to find yourselves penetrated with the feeling for architectural form and perfection which as the results of centuries of development have been discovered to be the best. This study is, in truth, analogous to that of the sculptor, as illustrated by the exquisite work of that great man (Flaxman) which just now you have an opportunity of studying within these walls. You see him drawing from the life until he has mastered all the motions and attitudes, outlines and muscles of the human form. Then possessed to the full of this knowledge, he lavishes his poetical spirit on combinations of figures, which illustrate at every turn his power, his knowledge, and the perfection of his sentiment. The commonest subject in his hands becomes endued with a beauty and a grace which are so natural as to seem inherent. What the human form was to him, the complete study of the accumulated experience of ages in existing buildings is to you. And you are to use them not that you may steal from them, but that you may be able to deal with the problems that come before you with the same spirit and power that they show, whilst you avoid with care the failures and mistakes which you can discover in them. You may well ask me here how far such a due study of ancient examples as I have been advising must be carried in the direction of purely archæological inquiries; and I think some advice on this point will not be thrown away. It is quite true that archæology is not architecture; but one-half at least of the studies of any architect who cares for anything beyond the work of his own hands has its antiquarian side; and what is important is, that this alternative side to your studies, far from diminishing your interest in them, is sure to enhance them. In the history of the development of styles, you have matter for endless interest. The buildings you admire and examine are the work of men of whom you know nothing, and who lived ages ago, perhaps. Unless you can put them in their proper places in relation to each other, in their proper sequence, you will never be able to understand their gradual developments; and accurate knowledge on such a point is, beyond everything, useful to men who have any hope of making any further developments in their art. There is a fruitful sort of antiquarianism, and a dry and fruitless sort; and it is with the former only that I care to advise you to interest yourselves. You may well leave the rest to the men who are antiquaries and nothing else, and with whom art counts for no more than antiquity. But you cannot leave to them those analyses of the progress of art in each man's work, from one man and one age to another, or from one country to another, without most serious loss to yourselves. I know nothing more useful than such studies and such acomplishments as these. They will prevent your being drawn into the downward current which sets strongly in the direction of business as against art; for the man who has once devoted himself to them will never lose that interest in the higher developments of his art which it ought to be, above all, your ambition to have and maintain. There is much more to be said as to the direction your studies should take; but before I touch on this I must get you, if I can, to realise that you must devote some at least of your time to the sister arts of painting and sculpture; and this not with any idea of excelling in the practice of all the arts,—that is a happiness reserved for a few heaven-born and greatly-gifted mortals! But rather with the thought that unless you know enough about other arts to be convinced of their highest developments in connection with architecture, you will be like so many of your predecessors, unable or unwilling to recognise that in the harmonious combination of all the arts is the greatest future for each of them separately; and it is from among the ranks of you who are now growing up that we hope the men will come who will have the happiness of seeing what will really be a resurrection of art in this land. The practical divorce of the arts has ended in the gravest loss to all. The architect has become too much of a mere builder; the painter lives to make pictures to be lived with and loved by a few, instead of the many; and the sculptor's life is too often spent on work for which he cannot care much, because it is of no general interest, men having too often forgotten that his work is beyond all other that which completes and beautifies and ennobles the work of the architect. On some other occasion I shall hope to be able to speak to some of you at length on this point, for I am persuaded that there is nothing by which both arts will gain so much as by the more frequent combination of the two. For your own share in such a consummation in the future, you will not find so much opportunity for study in England as elsewhere, but you should lose no opportunity of familiarising yourselves with examples of mural decoration, whether by sculpture or painting, in books, of which, as you know, we have access to a goodly store in the library of this Academy; and for acquainting yourselves with sculpture, there is nothing more to be desired than that you should give up some of your time to drawing and modelling from ancient examples, a very large proportion of the finest works of all times being the sculptured decorations of buildings of the Classical, and Mediæval, and the Early Renaissance schools. No small advantage will those gain who devote some of their time to learning to model. In my opinion, all the decorative sculpture or carving in a building ought to be modelled in the first instance by the architect. This is the only way in which that harmony throughout the work can be secured which is essential to good effect. It is impossible to direct another man properly merely by giving drawings for such work, and you must learn to give your instructions in the round. The day, I hope, may not be far distant when all sculptors will agree with me—if, indeed, they do not so already—in thinking that the best of their work would be even better than before if it showed a thorough appreciation of, and fitness for, the requirements of the building in which it is placed. I know nothing more fascinating than the evidence in most ancient work of the same feeling as to detail being common to the architect and the sculptor. You do not see where the work of one ends and of the other begins. The sculptor seems to know all about architecture and the architect to be quite conversant with sculpture; and I much wish that in the architectural school here we occasionally, or even, I may say, regularly, found some students of sculpture laying aside their modelling tools and their chisels, and coming to us for some instruction in the art, a good knowledge of which is essential to their own complete success. In future lectures in this course I shall have repeatedly to refer to the works of sculptors and architects, in which it is difficult to say which of the two arts can most rightly claim the artist. But if this is again to be the case, the young sculptor must understand that he has to master something more than the rudiments of architectural styles, and that, when he condescends to think of work which is half architectural and half sculptural, it must be with a complete sense of the equality of the two arts, if his work is to live with that of the great masters of all old and true schools. If the sculptor ought to learn so much of architecture, how far ought the architect to go in the study of the human figure? It is a question surrounded with difficulty. A great building may be built which shall not include any representation of the human figure. Either by accident or by robbery of their sculpture, some buildings which once had figure sculpture have none now, and yet are hardly less evidently beautiful in their effect. The practical difficulty about drawing

* Lectures on Architecture to Students of the Royal Academy. By George Edmund Street, R.A. No. 1: delivered Monday, Feb. 14, 1881.

from the life is that if it is carried a very little way it is of no service, whilst if it is persevered in very far it is almost certain to be at the expense of other accomplishments which are even more essential, and there is a risk that the student may end by being both a bad figure-painter and a worse architect than he would otherwise have been. It is only, therefore, in those very rare cases in which an architectural student feels a complete conviction that he has the unusual and rarely-given power of combining the two arts that he should venture to avail himself to any great extent of the privilege which is conceded to him in this Academy, though he should never lose any opportunity of studying the history of the combination of painting with architecture, and of making himself fairly learned in the theory of such work. This he may do, whether he can draw the human figure or not, and unless he has done it he will never be able to associate himself with a painter in counsels as to the completion of his own work. In addition to improving your skill as artists, on which I have been saying so much, you are bound to spend a great deal of time on other studies, without which you can hardly hope to rise to real eminence. There is, first of all, a long course of practical study, which will show its results in your work with certainty. All the visitors of our Architectural School feel, I am sure, as I do, that there is much to be improved in this respect in the work of the majority of the students. You ought never to make serious mistakes about simple matters of construction, or simple details of arrangement. Many of them are the result simply of a want of a little common sense, than which there is no quality that an artist of any sort ought more sedulously to cultivate, and the architect most of all. And as, perhaps, it is when you make a ground-plan that this failure is most evident, a few words on this, which is the foundation of all good architectural work, will not be out of place. In making a plan there are two things to consider; first, the convenience of the building for its purpose; and next, its suitability for its position. All good artists welcome with pleasure what is called a difficult site. In truth, there is no site so easy to deal with. It is when the site has no marked features of its own that the architect must make those of his own work predominant. The Acropolis of Athens and the Forum Romanum of Rome are, in one sense, difficult sites. That is, they are so picturesque, so irregular in their levels, that everything has to grow out of the necessities of its situation. There are no lessons more useful than those which you may learn from such examples as these. The Greek added one building to another in an almost picturesque confusion, and in a mode in which, if we believed some of our teachers of a few years back, it is impossible for any but the most erratic Gothic architect to take any pleasure. The Roman made a winding and irregular descent from the Capitol, with buildings of wholly dissimilar style on either hand, as he descended, and then when he had passed through the arch of Septimus Severus, and found himself in face of a straight road for a short distance, he took care that it should be occupied by a succession of irregularly-placed and designed columns, monumental pedestals, and buildings, whose beauty was that which came from the individual character of each, as well as from the gradual growth of the whole, and the evidence it afforded of the historical continuity of the community and its arts. Nor when the Forum was left behind, and but a short distance separated the Romans from the Colisseum, was there any care to secure a straight road from one to the other. The paved roadway meandered on under the arch of Titus, suiting itself to whatever conditions existed in the easiest fashion possible, and without any thought whatever of those necessities for formal setting out of cities which are only reasonable when, as in many Transatlantic examples, there is no history whatever to be recorded, and a whole town is laid out at one time, and completed almost as soon as laid out. There are cases in which, however, the wise architect endeavours not only to build to suit his site, but to make the peculiarities of his site suit some sumptuous and scenic laying out of his whole building. Time will not admit, however, to give more than a passing reference to a subject, which in itself affords materials for many a lecture. Nor is it at the outset of your life that you are likely to have such opportunities as would enable you to realise the advantages of the study. I have told you that you must study convenience of plan. This you may do, not to the exclusion of architectural effect and character, but always with a strict eye to it. In designing the plan of a house, for instance, it does not do to make the external design first and then to make the interior fit it somehow or other. It is necessary to keep both in your mind, but it is the interior that ought to be supreme. The best exterior in the world would not atone for a faulty internal plan. And observe that a good interior is not simply one planned upon some everyday scheme, and one in which life does not simply go on smoothly and without hindrance, but one which has so much suggestiveness and special adaptation as to make it in every way an interesting one to live in or to use. To accomplish this you must realise how every part is to be used, and so contrive as to give every one pleasure in using it. It is this harmonious and reasonable variation of plan that gives the greatest value and charm not only to the interior, but, as a natural consequence, to the exterior also. The same rule applies to all other buildings. If they are well contrived for their special use, depend upon it you will be just as well able to make their elevations good as if they are carelessly contrived. A church requires by custom, by law, or by sentiment, a generally similar arrangement of the plan. At least, it requires the same component parts—a nave, a chancel, a porch, a steeple, a vestry. How differently may not these be grouped and designed! The variations in the provision for the given wants in this case are, as you know, innumerable. And how much more various may not the plans for a house be? If you realise that the real value of architecture, as of all the arts, is its human and personal interest, you will see how impossible it is that any art can be worth anything in which this is wholly ignored. The only justification of endless rows and groups of houses, all arranged on the same lines down to the pattern of the scraper and the design of the area-railings, or of the balconies, is that the people who are to inhabit them are so identical in all their wants, wishes, and modes of life, that one pattern of house will do for all. Fortunately this is no more true of this age than of past ages. And now, as then, the best-planned buildings will be those which take account of the existence of a diversity of men, with endless varieties of tastes, and wants, and circumstances. It is here that the study of ancient art is so invaluable. In former days, with much less facility for intercourse and movement, we see how many are the adaptations which architects had to make when they went from one part of Europe to another. In our own time this is of every-day occurrence. An English architect may be called on at any time, at the very outset of his career, to go to some foreign dependency where every condition of life and climate are wholly different from what they are in England. The plans as well as the architectural forms which are suitable in England are wholly out of place in a tropical country. In one, just as much as in the other, the same first principles may have to be observed, but the resulting forms will be wholly dissimilar; and the man who begins life with some knowledge of how such differences have been successfully dealt with before, has an untold advantage over the man who treats all countries and all climates alike, as if the satisfaction of local requirements were not, in truth, the very first condition of a good piece of architecture. Before I conclude, there are two points only on which I must say a few words. One is the necessity for study of much which we cannot teach you here, and which you will never learn in the workshop of an architect. Such, for instance, is the study of language and the study of books. I cannot too strongly insist on the former. Without a knowledge of modern languages you cannot travel with complete pleasure, and you cannot know anything of the largest half of the literature of your art; and unless you have travelled, and unless you have read a good deal of what architects and critics in other countries teach and think, you have deliberately shut yourselves out from a large portion of the education which is indispensable to an accomplished architect. As students, you have access in this academy to a most admirable artistic library, year by year becoming more and more complete, and where you may do more to cultivate your own taste by acquaintance with the best examples of all times than I can do for you by any number of lectures or addresses. And, in the second place, I wish to say but a few words on the way in which you avail yourselves of the instruction offered you in the schools. I have no desire whatever to exaggerate its importance. Most of you, I hope, are at work day after day on the drawings and designs of the architects under whom you are studying. Nothing is a better training than such work as this. If you have given you the original drawing—be it general design, or detail of a part at large—and are condemned to complete it either by putting his pencil lines into ink, or by the slower process of copying it, you are learning in the best way all that he can teach you. But you are in one groove, and affected only by one mind; and by coming here you find yourselves brought face to face with new ideas and views, inasmuch as you have to work under the direction of the visitors assisted by the master. But, to make any good use of such opportunities, it is not enough to come here occasionally, and only and so often as is absolutely necessary, but with regularity, punctuality, and preparedness. The one regret that I feel in connection with our architectural school is that the students do not, as a rule, appear to wish to attend once more than is absolutely necessary, and when one sees anything short of the highest zeal, one is led to anticipate something very far short of the highest success. It is this absence of enthusiasm for his work which is fatal to an artist. If you have it you will think no hours too long for work, and labour, instead of being toilsome, will be your greatest pleasure. Unless you have enthusiasm for your art yourselves, how can you expect that others will have any to spare for you and your work? It is a contagious quality. The artist who really has it does his work in such a way as to make others feel for him what he feels for his own work. This is seldom, if ever, worthy of love and admiration, unless it is the outcome of a zeal and a fire which are real and intense. If we have such a zeal, how will it show itself on our works? This is a question which affects what is called the practice of our art as distinguished from the study. I have left myself scant time to speak on this part of my subject, but fortunately there is not much to be said. In art a man who has zeal must almost of necessity have more zeal for some of its forms than for others. The forms which our art has taken are styles in which it is almost impossible for any artist to take an equal interest. And a man who is really an artist will find it natural to practice in one style, impossible to do so in another. Modern practice has tried to convert the world to an opposite view; it has assumed that an architect can design equally well in any style. Of course, if this were true, there would be no art in the work, for an artist must show himself in his work, and it would be impossible to do this in antagonistic things. It is not, in my judgment, necessary or desirable that I should pronounce positively to you as to which is the best form for the architecture of the present day. That, when you have studied and thought, and worked for a few more years, each of you will have to decide himself. But this I can tell you, that if you have zeal enough and enthusiasm to care for your art for Art's sake, you are far more sure of success by adhering strictly to what you believe to be good, true, honest, and artistic work, than if you attempt to please everybody by doing whatever you are asked to do in whatever style or fashion may be dictated. The man who knows how to do one thing well is more certain of success than he who tries to know a little of everything, and in study and in practice common sense and good art both claim from you that you should at any rate know the style of your own choice well. Beyond all doubt it is a sort of inspiration that is required in the artist who is ever to do any really great work, and this will never come to one who never dreams of perfection, who thinks first of all of gain and worldly interest, who treats his art as a mere matter of business and routine, not as an imperious mistress who must have all his devotion and all his heart. To secure this enthusiasm you must be dreamers in one way only—you may give reins to your imagination—you may dream of beauty, of majesty, of perfection—you may picture to yourself what you would and will accomplish; but you must be no dreamers about your proper work. That must be constant, steady

in purpose, thoughtful, and always in some way bearing on your art either directly or indirectly. The more time you devote to study the more will you become engrossed in your art, and the more you will find that it is delightful and interesting in all its changes and developments of old, and in the practical application of what you learn from these to the art of your own time. Industry alone will not make a great artist: but if there is one thing more certain than another in art, it is that all great artists have been industrious, and that if you wish to be numbered in their results you must follow their example.

ST. PETER'S AND ST. PAUL'S CATHEDRALS COMPARED.

MR. SOMERS CLARKE, JUN., read a paper on "St. Peter's and St. Paul's" before St. Paul's Ecclesiological Society on Thursday, the 17th inst. A building was to be accounted an example of good or bad architecture, the lecturer reminded his hearers, in proportion to its adaptability to its purpose, suitability of design to materials of construction, and its accordance with the laws of Nature; its style was but a question of grammar, and mattered little so long as the ideas were clearly expressed. Those learned in architectural grammar found that the west-front of St. Paul's was full of blunders, details badly applied, and quite contrary to rule; the portico was deficient in projection, two orders were superposed, the columns were doubled and were wrongly spaced; yet all felt, on looking at the front, that it was but scant praise to call it "the most pleasing design of its class that had yet been executed." But in the chief front of St. Peter's (called for convenience the west-end, but really facing east) the dimensions were colossal; the balustrade surmounting the front rose far higher than the western towers of our own church, whilst the width was nearly double. The grammatical blunders, although many, were not so numerous as at St. Paul's. Yet, in effect, St. Peter's was as huge a failure as St. Paul's was a triumphant success. The beauty of St. Paul's did not rest on the correct application of the Classic styles, but upon outline, massing of parts, contrast between the spiring form of the western towers and the vast shell of the dome, and the placing of these in just relation to one another. The lecturer sketched the history of the rebuilding of St. Peter's, from 1450 to its structural completion. The plan was recast, and the prodigious dome was conceived and originated by Bramante, the architect, from 1503 to 1510; he was followed by Raffaelle and F. A. Gioconde, who elongated the nave to about its present length. Antonio de San Gallo succeeded in 1517, and proposed developments of the design, by which it would have been made much superior to the present building. Peruggi, the next architect, readopted the Greek cross of Bramante, and introduced great retrenchments, cutting down the scheme. Antonio de San Gallo the younger added to his Greek cross a vestibule, and a vast façade, running north and south; his original design, still preserved, showing much which seemed to have suggested to Wren what was called his favourite design for St. Paul's, but with the essential difference that Wren's dome was to stand on eight piers, whilst San Gallo's dome had four piers already constructed. Michael Angelo, 1546-64, cut down San Gallo's plan, which had only been partly completed, ruthlessly; he gave up the vestibule, struck out all aisles and side-chapels, and reduced the scheme to extreme simplicity. With beautiful detail the vastness of the dimensions would have made his interior impressive, although not equal to Bramante's or the younger San Gallo's designs; but Michael Angelo did his best to destroy any grandeur of effect by the huge and vulgar details adopted. The Greek cross was now completed, the substructure of the dome partly reared, and shortly after Michael Angelo's death, roofed in. In the 17th century the existing nave was added by Carlo Maderna. Granted, that this elongation had diminished the appearance of concentration of effect on the dome, what was it made the interior of St. Peter's so disappointing? It seemed utterly devoid of human interest, frigid, and unsympathetic; it was more crushing than the interior of St. Paul's, yet all would admit that the proportion of the dome and its surrounding parts to one another was far superior to that of Wren's masterpiece. Mr. E. A. Freeman had shown that the disappointment universally felt in first entering St. Peter's was due to the blunder of the architects in adopting the magnifying in place of the multiplying principle, the individual arches and other features being enlarged instead of introducing a number of features of the same kind. St. Paul's in re-erection passed through no such vicissitudes as the fellow-church, and we were able to follow the gradual growth of the scheme from the drawings left by Sir Christopher Wren. Before the Great Fire Wren was called in to repair Old St. Paul's, and he then proposed to use the old cruciform plan, but "to cut off the inner corners of the cross, making a dome in the middle, after a good Roman manner." Wren was closely connected with Ely, where this very scheme had been adopted in the 14th century. When the Great Fire of 1666 ruined the old cathedral, Wren showed himself desirous to throw over all Gothic traditions, and although he had never been to Rome, yet he produced a design which, on comparison, is shown, both on plan and elevation, to bear strong affinity to San Gallo the younger's plan for St. Peter's. Fortunately, the clergy insisted on a "cathedral form" being preserved, and the result was a more spacious and convenient building, and a much more effective design than Wren's first proposal. Bramante and San Gallo were largely influenced in their designs by the influence of the gigantic ruins in Rome, erected at a period when art was at a low ebb; the idea of St. Peter's was essentially that of the Basilica of Maxentius, and the Parthenon dome. Again the Roman method had always been to build in brick, faced with thin slabs of marble held on by cramps, and this mode of construction exercised a powerful and not often recognised influence on the design for St. Peter's. Although the external walls of that cathedral were faced with stone, all the rest of the building was of brick. The whole interior was, when first finished, decorated not with marble or solid stone, but with plaster. Those parts near the eye, and that could be touched, were now being gradually cut away and replaced by marble; but from one end of the church to the other not a single leading architectural feature was of that material. Consequently, what would otherwise have been moderate-sized piers or pillars were developed into enormous brick piers, mountains of material. Wren, although aiming at building after "a good Roman manner," was fortunately unacquainted with Roman manners of construction, and we therefore had in St. Paul's a building which was really built of stone within and without and in which all wall-surfaces, decorative features, and carved details were executed in stone. For this reason he thought Mr. Burges, A.R.A., was singularly out of sympathy with St. Paul's, when in his scheme of decoration he proposed to chip away a greater part of its internal surface, and replace it with a marble veneer. St. Peter's was intended so to be treated; St. Paul's was not, for the leading lines were all in solid wrought-stone, and were integral parts of the structure. Turning to the plan of St. Paul's, it would be seen that the long and narrow nave carried out was not so useful as would have been one of greater breadth and less length, and the internal effect of the building, now an unhappy compromise between a long and a domed church, based, the one on a Latin, the other on a Greek cross, would have been improved. It was curious to observe the many coincidences of the plans of New St. Paul's and Ely, yet there was no careless imitation, When having made each point his own. His conception was English Mediæval, covered with a Roman skin not very correct in detail. The economy of material was remarkably seen in the dome, which was quite original, and was, indeed, a perfect masterpiece of scientific construction. Owing to the multiplicity of parts in St. Paul's, its dome, and still more its nave, looked larger than St. Peter's; although the dimensions were much less. In St. Paul's, Wren, regardless of all precedent, introduced an attic story, answering very nearly to the Mediæval triforium, in order to carry the vault of nave. This had been denounced by critics as a shocking grammatical blunder; but as it played a useful part in the construction of the building, this innovation was but one of several instances in which Wren permitted his good sense and imagination to get the better of his rules. In looking eastward the whole effect of St. Peter's was better, because more concentrated than that of St. Paul's. In the latter they had a nave not very wide and of some length, terminating in a vast area, beyond which came what appeared to be a contracted and gloomy passage, rather than a continuation of the nave. To prove that Wren's first proposal of a Greek cross would have been better, they had but to compare the view up the nave with that from either transept-door. Further than this, if the long choir of St. Paul's could be closed, and the altar placed under the eastern arch of the dome area, there would be a great practical benefit, and this, which was nearly akin to one of the proposals of Wren, he threw out as an addition to the many schemes which had been propounded for "completing St. Paul's."

THE BEDDING OF GIRDERS.

IN fixing girders for bridges a good bearing is important, and the size of the templates should be made to distribute the weight upon an area of surface of the pier adequate to the purpose, allowing a good margin. In iron bridges the expansion and contraction of the metal necessitates a means to allow for longitudinal movement at one end. This is effected usually by a series of rollers running upon a bed-plate resting on the pier, and these rollers should be numerous enough to distribute the weight of half the girder and its load. The rollers should be of wrought-iron, about 3in. diameter, and these are fixed so that they are kept at a proper distance apart. The main girder has usually a plate fixed below its end which forms, as it were, an upper bed-plate, and this rests on the rollers. Another necessary precaution is to allow for the tilting action at the ends of a girder which deflects under a load. To provide for this and to insure an even bearing the girder should not be rigidly fixed to the upper bed-plate, but be hollowed out so as to form a kind of rule-joint, thus allowing the end of the girder to tilt, at the same time keeping its position firmly on the rollers.

It is necessary to fix the bottom bed-plate securely to the stone capping or template of the pier, and levers or dovetail bolts should be used, and the bearings upon the rollers ought to be carefully fitted and ground.

CISTERNS.

SOME good advice is given in Mr. Parry's recently published book on "Water: its Composition and Collection," with respect to cisterns. Lead-lined cisterns are better avoided, though they form a large class in the older houses; and it is pointed out that water seldom acts on tarnished lead, though bright new lead is often acted upon by it. It is not so generally known as it ought to be, that zinc is liable to be acted upon, and may produce metallic poisoning. A large number of new cisterns in the smaller houses in the suburbs are zinc-lined, and the fact ought to be noted, though we have not heard of any case in which poisoning from this cause has been proved, or even suspected. Speaking of iron cisterns, the author remarks that "if iron cisterns are used they should receive a coat of boiled linseed oil, carefully applied, before they leave the ironfounders' premises, and before they are painted. A wash of Portland cement affords an excellent protection for iron, if skilfully put on. The iron should receive three coats, and the wash should be renewed every year."

We very much doubt if more than a very small percentage of cisterns are ever cleaned. This neglect arises chiefly, probably, from the inaccessible, awkward positions in which they are frequently placed. How often do we find them fixed close up to the roof as a lean-to, without sufficient space for a man to put his head to look into it, and certainly without space for cleansing. If they are fixed outside, as they often are, they are found without lids, so that any filth or decomposing matter may fall or be thrown in. Any dirty and inconvenient corner appears to be a place for a cistern, and it is time architects paid more attention to a point which they generally leave to chance. In many houses the tenants do not know even where to find the cistern. Good ventilation and sufficient light are two essential conditions to be met in selecting a suitable place, and those who take or buy houses, should, above all, see that there is no connecting pipe or overflow, between the cistern and water-closet or drain.

NEW CHURCH OF ST. MARY ABBOTTS, KENSINGTON.—GRAMMAR SCHOOL AT HAMPTON.—DESIGN FOR A CONCRETE HOUSE.—SECOND PREMIATED DESIGN FOR THE GLASGOW MUNICIPAL BUILDINGS.

OUR LITHOGRAPHIC ILLUSTRATIONS.

ST. MARY ABBOTTS CHURCH, KENSINGTON.

To-day our double-page plate illustrates in detail the several stages of the spire and upper part of the tower of this church, both in elevation as well as in section. Last week we published the south elevation with general ground-plan, and also a detail of the west front. Our next illustration of this building will include a general elevation of the tower and spire as completed, with a longitudinal of the entire church. The late Sir Gilbert Scott, R A , was the architect.

HAMPTON GRAMMAR-SCHOOL.

This school, founded A.D. 1556, was reconstituted under a scheme of the Charity Commissioners, dated Nov. 27, 1878, and that enabled the governors, of whom Mr. Alderman Knight is the chairman. to give instructions for the erection of the building of which we give an illustration this week. The foundation-stone was laid by Lord George Hamilton on the 11th day of October, 1879, and the building was occupied in the autumn of last year. It is constructed of red bricks and Bath stone, and provides accommodation for 25 boarders and 125 day-scholars, at 3½ to 4 guineas per term, and care has been taken, in arranging the plan, to admit of further extension ; and already it is in contemplation to erect a school-chapel. The building, including an infirmary in the grounds, was erected at a cost of £6,887, by Mr. S. W. Anes, of the Atlas Building Works, Putney.

DESIGN FOR A CONCRETE HOUSE.

Concrete construction is constantly a subject for debate by all interested in building, and few have done more towards its development than Mr. Lascelles. To-day we publish a design prepared for him by Mr. Ernest Newton, architect, for erection in concrete slabs, tile work and half-timber construction being imitated by the material in question, which is only 1½in. thick, built upon concrete studding ; the chimney-stacks in red brickwork.

GLASGOW MUNICIPAL BUILDINGS COMPETITION.

We illustrate, this week, the design to which, in the late competition, out of 98 submitted, Mr. Barry awarded the second premium of 500 guineas. Messrs. Coe and Robinson, the authors of this design, appear by their report to have adhered very closely to Mr. Carrick's plan, considering, indeed, that the terms of the competition bound them to this course. The report further mentions that in the composition of their design their aim has been to give it (in the terms of the competition) a broad and dignified, rather than a florid character ; and with this in view, they have adopted the pure Classic style, avoiding, as far as possible, any tendency towards the freedom of Renaissance. The design consists of a principal order on a rustic basement, the skyline being broken by one large tower placed over the principal staircase, and rising boldly behind the central mass of the front elevation. In the plans, the large apartment shown in the ground-plan is the telling-room, for receiving gas and water-rates. In the first-floor plan, the large apartment on the left hand at the top is the Town-hall ; those next to it, on the right hand, are the gas and water offices ; on the right hand are shown various offices and committee-rooms. The octagonal chamber at the bottom is the Lord Provost's room, and that to the right of it an ante-room. To the left hand are shown three saloons, and the oval room behind the reception-room and staircase is the council-chamber.

DIMENSIONS OF GIRDER BRIDGES.

At a meeting on Tuesday of the Institution of Civil Engineers, a paper was read "On the Weight and Limiting Dimensions of Girder Bridges," by Mr. M. am Ende, Assoc. M.Inst. C.E. The author treated of a formula for the weight of girder bridges, which he based, to some extent theoretically, upon the strains in the principal or primary parts, viz., the flanges, the vertical web, and the wind-bracing, and to some extent empirically, upon the experimental construction of the secondary parts or bracing. A distinction was made between the theoretical and the practical weight of girders. The former was the weight of an ideal structure, without connections and lateral stiffening ; the latter contained the theoretical weight, together with constants of construction, for the various parts, and an item for secondary bracing in addition. The constants of construction (such as the allowances for rivet-holes and cover-plates) were generally understood, and there was no great variety of practice ; but practice varied greatly with regard to the allowance for secondary bracing. It would be inaccurate to draw conclusions from existing structures as to that item, even for structures of equal size ; but it would be entirely misleading to do the same with regard to structures of much larger size and of different proportions. The author considered it, therefore, requisite to design such structures in order to ascertain the item for secondary bracing over the whole range of practical construction. Omitting smaller structures, in which the secondary bracing was ruled by considerations apart from strict economy, this range extended from spans of 150 feet to 1,500 feet. The designs represented spans of 1,500, 1,000, 750, 500, 255, and 150 feet, the latter two having been executed for the Costa Rica State Railway. The system, common to all, was novel ; and great economic advantages were claimed for it.

The principal features were :—1, a polygonal form of the top flange composed of only five straight or nearly straight members ; 2, in consequence of this form few meshes in the web ; 3, the depth of the girders at 1-10th and 9-10th of the span was equal to one-half of the depth in the centre as characteristic of the form of the girders ; 4th, the depth in the centre was equal to 1-5th and 1-6th of the span ; 5, the widths of the bridges were determined according to a practical formula ; 6, the construction in detail was accomplished almost entirely with rolled bars, plates being used only at the junctions of the principal members. Points 1 to 3 were based upon a calculation of the theoretical weights of a number of forms of girders with a polygonal as well as with a curved top flange, the results being stated on a diagram. Point 4 was based upon results derived from the formula referred to in the latter part of the paper. Point 5 required a formula of a curve which was an asymptote to a straight line of an assumed inclination (here 1 in 30) ; such a curve was an hyperbola. Point 6 was in accordance with the modern style of bridge-building.

From these designs six values for the secondary bracings were derived. If, then, the weight was hypothetically put :—

$$z' \ (D+z'') \ x \ (B+z''')y \ L$$

viz., as a function of the three principal dimensions of the structure, D the depth, B the width, and L the span, five values would be sufficient to determine the five contants. They were found to be the following :—

$$z' = 0\ 007,\ z'' = -10;\ z''' = -6;\ x = y = \tfrac{1}{2}$$

This constituted the empirical part of the problem. Referring again to the theoretical part, a simple system had to be chosen, since a formula was required equally correct for all proportions of span to depth, besides not being too complicated. Such simple systems were the girder with two parallel flanges, and the bow-string girder with a parabola of the 2nd degree. The latter was preferred as having more points of resemblance with the girder of greatest economy than the former. The weight of the ideal structure mentioned above was determined entirely on theoretical grounds, while the necessary additions for the practical weight were derived from the designs, under the assumption that an equal degree of economy could be observed in the practical construction of the bow-string girder. The formula for the weight of the parabolic girder bridge thus completed could be utilised to ascertain not only the limiting spans of such bridges, but also a point of greater importance, viz., the most economic proportion of the depth to the span of the girders. This influence of the depth upon the weight of girders was illustrated by a diagram, which formed the record of a large number of results obtained from the formula. The author was led by it to conclusions which were in perfect harmony with experience and modern practice, viz., that for very large bridges the best proportion of depth to span was from about 1 in 4 to 1 in 5, and for small bridges 1 in 6 to 1 in 8. With a view of applying the formula to other systems, especially to the system of greatest economy, the theoretical weights of various forms of girders were calculated, and the results tabulated on the diagram before referred to. This embraced the parabolic girders of the 2nd, 3rd, 4th, 5th, and ∞ h degree (being necessarily all girders with many meshes in the web), and a number of girders with few meshes in the web, among which was the girder of greatest theoretical economy, and the girder illustrated in the design.

A formula was then given analogous to the formula for the common parabolic girder, but containing as a factor the proportion of the theoretical weight of any given form to that of the parabolic girder, and the practical weight could thus be calculated by referring to the table.

A diagram was exhibited showing the limiting depths of all parabolic girder-bridges, *i.e.*, the depths at which the weights were infinite ; the curve defining these depths was an ellipse. The same diagram showed the depths which limited economy, *i.e.*, at which the weights were a minimum. Another diagram showed in detail the weights of the principal parts of all parabolic girder-bridges, the depths of which were most economical.

In the summary the author referred to the incompleteness of the investigations contained in the communication, and expressed his belief that a great deal more might be done in the same direction ; but he thought he had succeeded in showing that the construction of a formula generally applicable to the girder-bridges was not an impossibilty, and that even in its present form it would be of practical use for estimating the weights of large bridges. The mathematical part required to determine the theoretical weights of flanges, web, and wind-bracing, was contained in an appendix.

CHIPS.

With reference to the Royal Academy design for a college, which we published last week, we find that it was not "reckoned second" in the competition, as we were informed. There is no second or third place or prize awarded in the Travelling Studentship competition.

The parish-church of Northaw, near Barnet, was destroyed by fire on Sunday, consequent on the over-heating of the warming apparatus. The church was a Perpendicular structure, and was restored a few years since at a cost of £3,000, and a new organ was erected only three months ago.

Memorial-stones of a new Baptist chapel, in course of erection in Marsh-street, Ashford, East Kent, were laid on Wednesday week. Mr. W. R. King is the architect, and the cost will be about £2,000.

The fine old parish-church of North Curry, near Taunton, is now in the hands of the builder, and a thorough restoration is intended. The rich and massive octagonal towers are crumbling away to such an extent that scarcely a perfect stone or a portion of its details can be seen. The nave and aisle walls are bulged and overhanging to a dangerous extent. The architect is Mr. John O. Scott, son and successor to the late Sir Gilbert Scott, and the clerk of works is Mr. Hannaford.

DESIGN FOR A CONCRETE HOUSE FOR MR LASCELLES.

DESIGNED BY ERNEST NEWTON, ARCHITECT.

TRURO, AND ITS CATHEDRAL.

THE old parish-church of St. Mary is now almost entirely removed, and the general works are being pushed on by Mr. James Bubb, Mr. Pearson's clerk of works, as fast as frost and snow will allow some 40 or 50 men to proceed. The stained-glass windows that were in its south aisle have been carefully removed for future use, and all the monuments have been cared for in like manner. When the old roofs were taken off, the timbers were found to be so rotten that the wonder is they have stood so long. The south arcade had its stones so firmly cemented together, that to remove them piecemeal was a work of the greatest difficulty. They will all be re-incorporated into the new cathedral. The south wall still stands, 9½in. out of the perpendicular, and propped by stays. It will be pushed back bodily to its original upright position by "jacks," and then will form the south wall of the choir of the new edifice. The foundations for the choir itself are nearly all laid, and a large quantity of earth has been removed preparatory to forming the crypt.

Such of the granite of the old tower that was sound and good, has been reworked for the courses under the plinth and for those between the base-moulds of the crypt. Some of these latter are in the old material also.

A note or two upon the old church just sacrificed for the new cathedral's sake, may at this particular period be interesting, and serve as some record of the past, useful for reference in years to come. St. Mary's Church was, in the main, of Perpendicular type, and it seems quite a matter of conjecture what earlier buildings preceded it. The various dates at which any mention occurs of these are few and far between.

In September, 1259, Bishop Bronescombe, of Exeter—he ruled the See from 1257 till 1280—visited Truro, and dedicated the church of Kenwyn—the day following that of St. Mary's, Truro, and the day after, the church of the already established Dominican Friars. On November 6th, 1328, Bishop Grandison dedicated a high altar at Truro, and in 1421 Bishop Lacy licensed the chapel of St. George, in the parish of St. Mary—which does not imply, of course, that it was a separate church—and the jambs of a window in one of the aisles seem to indicate that formerly this chapel was attached to St. Mary's.

Writing during the reign of Henry VIII., Leland, in his "Itinerary," makes reference to "one paroche Church in Truru;" and another writer (Hals) says that some of the old glass in the north aisle bore the arms of John, Earl of Cornwall, who succeeded to the Crown in 1199. In Kenwyn-street, close by, a Dominican Priory was founded in 1250. There are records that William of Worcester visited it in 1478, and the building was standing until the middle of the last century. Besides the friary just alluded to, there was also, at Truro, a convent of Poor Clares, who, by the bye, had the repute for being very wealthy.

All that has been found that in any way throws light upon an earlier church, has been religiously preserved by the painstaking clerk of works, Mr. James Bubb, and so carefully has all being carried out under that gentleman's direction, that not so much as a single accident has occurred to life or limb during the progress of the works.

Amongst the brasses there is one to Cuthbert Sydenham, Mayor of Truro, in 1627. He died in 1630, and the memorial appears to be a *second-hand* one, for underneath Sydenham's brass, and on the same stone, was found an older one! Some interesting brasses were also found on a buried slab in the chancel-floor. As regards the windows in the north aisle, it is a curious fact proof exists of their having been originally built of an oolite—the original sills and some pieces of jamb left intact in situ proving this, and that the granite used afterwards was merely a restoration, and not the first work. Some 14th-century tracery and jambs were found, worked out of Elvan stone—the banker-marks of the masons are very distinct upon these stones. Many glazed and unglazed tiles were found buried in the chancel, together with a Spanish embossed tile of beautiful workmanship. Several old window-jambs found built in the north wall were, no doubt, those of the 14th-century window, which had been replaced by Perpendicular ones. These fragments were worked in Polyphant or Carclew stone—more probably the latter. Some sandstone remains are largely impregnated with iron, and show strong signs of oxidisation. Mr. Bubb also found, scattered under the floors, several pieces of a granite font, hexagonal in plan, and of Early English character. A piscina built in the north wall, two pieces of a stone newel pertaining to a turret staircase leading to the rood-loft, and other such suggestive items have been found and preserved. Of old woodwork a moulded oak curb—of 15th-century work—some elaborately carved wall-plates and purlins of the same date, and a piece of oak with the date of 1693 thereon are amongst the finds. The present (or rather just defunct) church was built "at the proper cost and charge of the inhabitants, and other pious benefactors," in the early part of the 16th century. There still exists an interesting deed, dated 1504, wherein Sir John Arundel grants permission to the inhabitants of Truro to quarry stone in his manor of Truro Vean, for the building "of the churche, and of a newe towre in the pyshe of owre Ladye of Truro." Amongst the remains of ancient stained-glass in the windows of the south aisle, were to be traced the arms of the Tregians, Trenoweths, Arundells, Carmmenows, Edgecombes, and other of the original benefactors; but this glass was mostly swept away during the middle of last century. On one window, however, what is supposed to be the artist's name is yet preserved, it reads:—"Willmo. 1518." It was at the time that so much of the old glass went (1747), that the "restoration" of the building took place, and then the fine old waggon-headed oak roof was covered by the plaster Classic ceiling, that did duty until the present overthrow. The new spire and tower were built about the same time, and a record in the Churchwardens' book may be read under date of August 9, 1769, notifying that they "gave the men when they finished the steeple, 2s. 6d." The pulpit, which is an inlaid oak one of bulb-like shape, was made by one Bone, of Truro, who was father of the celebrated Royal Academician and enamel painter of that name. The corporation seats of carven oak were made in 1750; so was the organ built by Byfield, and intended originally for the Chapel Royal, but, not being utilised there, a native of Truro, named Lemon, bought it, and presented it to his parish-church. The altar table is of oak, and has around it a brass, on which is inscribed a text (John vi. 54). It was presented by the Rev. G. Phippen, who was vicar from 1625 to 1647. HARRY HEMS.

ROMAN REMAINS, LEADENHALL MARKET.

AN important archæological discovery has been made on the site of the new Leadenhall Market, the excavations for the building of which have been going on for some time, and have brought to light a number of old Roman and mediæval walls of various lengths and thicknesses. We are not yet in a position to give our archæological readers any definite information at present about the construction or original purpose of the structures unearthed; but we may say Mr. Miller, the clerk of works to the market, is engaged in plotting to scale the plan of the foundations; and when this has been done we hope to be able to lay before our readers more details. The plan, drawn from accurate data, reveals two separate walls of some thickness, with others at right angles, and their relative positions and levels lead to the conclusion that the old Roman foundations had been built upon at different periods. The thickest wall discovered is 9ft., though the excavations now proceeding are clearing another important wall. Some of our rather wise contemporaries have already hazarded a conjecture that the massive Roman foundation discovered is that "of a semi-circular apse extending to the unusual width of 33ft." The fact is that nothing of the sort has been absolutely proved, though it may have been imagined by some over-enthusiastic antiquaries who have visited the site. The curved wall which has given rise to this notion does not form more than half an apse (if it can be called one) but is cut by a wall in the centre. The curve has been found by careful investigation, made by the clerk of works, to be semi-elliptical, as it is struck from two centres, the radii being 19ft. 8in. for the large arc and 13ft. 4in. for the smaller. The foundation, or lower part of wall, exposed is 6ft. 8in. thick, above which was a fragment of the real wall 3ft. 11in., which lump of masonry showed a coating of 2½in. of plaster in three coats on the inside. There may be some reason for believing this curved wall formed the apse of some Roman building—perhaps a basilica, but till further discoveries have been made it will be futile to express an opinion. Several fragments of the upper portions of the walls have been found and carefully drawn to scale by the clerk of works, and these in some places measure 8 to 10ft. in height. They are particularly interesting, and show in all cases a Kentish rubble foundation of some height, after which are four courses of thick Roman tile; rubble again, of larger stones, and another layer of tiles, the red tiles forming an occasional bonding to the wall. Not the least important "finds" are rude stone arches formed of thin voussoirs of stones, very irregularly constructed. It has been thought by one antiquary these are Saxon.

THE NEW PARLIAMENT HOUSES FOR CAPE COLONY.

AFTER a competition, about ten years ago, which proved abortive, the Cape Town Government have prepared the contract-plans for their new Parliament House, and the tenders for the erection of the superstructure, furnished, we believe, by English and colonial builders, will be delivered on the 28th of the present month. Mr. Whichcord, P.R.I.B.A., was appointed consulting architect to the Government, and, we understand, has reported upon the general scheme, and has suggested many improvements, both in design and detail; but whether these will be made appears doubtful. The design is Classic, of a rather ordinary type, and with many commonplace features. The plan is an oblong parallelogram, the main façades being 264ft. long, and the return fronts 140ft. The centres of these façades are adorned by porticoes of the Corinthian order, the columns being in pairs, while the angles are emphasised by pavilions of slight projection and with domical roofs. It is intended to build these fronts with red brick, with the porticoes and architectural features and dressings of Portland cement, the materials for which are intended to be supplied from this country. We are sorry the Cape Government, with granite quarries at their service, have decided to adopt materials for their Parliament Houses which have been in this country only used of late years in inferior classes of building, and we hope that at least the columns of the main porticoes will be executed in the natural granite of the locality, a material which has been adopted for the substructure of the proposed building. The granite used for the latter is from the Paare quarries, about forty miles from Cape Town.

The general drawings have been prepared under the superintendence of Mr. J. Fforde, the chief inspector of the department in Cape Town, and the work is to be completed in March of 1883. The plan has been arranged to meet the requirements of the Government. Entering by the portico facing Grave-street, there is a hall and large central vestibule, extending through from one front to the other, and forming the central feature of the plan on its short axis. On each side of the hall, and opening directly from it, are the two chambers, the House of Assembly being on the left and the Council Chamber on the right. These are lighted mainly from the front by a series of pedimented windows, the sashes of which will be opened and regulated by a mechanical appliance beneath the windows. Each chamber is about 67ft. by 36ft. The Assembly chamber has its division lobbies. Corresponding to entrance-hall on the avenue front is a general library. The other frontages are taken up by retiring and waiting-rooms, record-offices, &c. On the first floor are the committee, waiting, and reporters' rooms, and the basement is devoted to record-rooms, &c. Two open areas, one on each side of the central vestibule, give light to the corridors and inner rooms. The central vestibule is a spacious apartment, surrounded by coupled columns and having a gallery, and with the legislative chambers is the main feature of the interior. The Grave-street façade will be of one story, the larger windows of the Assembly and Council chambers occupying the entire wings on each side of the portico; it rests on a granite basement; the avenue façade is of two stories above the basement, the centre portion under portico being of three stories. It is adorned by pilasters of one order. The fall of

the ground being considerable, the granite substructure is brought into view in some of the elevations, and will form a conspicuous element in the design. The present site is on rock, a previous one having been abandoned. We may add that teak is specified for all the sashes and frames, lintels, &c. The approximate cost will be about £120,000.

THE PROPOSED MUNICIPAL BUILDINGS AT GLASGOW.

THE Town Council of Glasgow held a special meeting on Tuesday last (22nd inst.), and resumed consideration of the scheme for the proposed new municipal buildings. The subject came before the Council in the form of a recommendation adopted in committee by a majority, to the effect that the city architect, Mr. John Carrick, should be instructed to re-adjust his sketch-plans so as to show accommodation in excess of that formerly contemplated; this extended accommodation to include an official residence for the Lord Provost, an art gallery, a public library, and apartments for the sanitary department. The Lord Provost moved the adoption of the committee's recommendation, raising the alternative question whether the restricted area of building-ground to which the recent competition was restricted should be adhered to, or whether the Council should exercise the compulsory powers it possesses under Act of Parliament, by acquiring additional ground to the east, and so securing a site large enough to carry a suite of public buildings worthy of the city, and providing, in a comprehensive way, for all local requirements. These broad issues were more or less clearly recognised by the Town Council, and the discussion ran more or less relevantly upon these lines. It was not a discussion involving architectural questions; what description of buildings should occupy the site was never alluded to. It had reference entirely to the extent of ground which should be set apart for municipal buildings, and the mind of magistrates and common councilmen was chiefly exercised in regard to the greater amount of "siller" involved in the larger scheme. The Lord Provost, in supporting his motion, admitted of course that extra expenditure was involved in the purposed amended scheme; but he contended that in any case this increased cost must be met one way or another, and he referred to a proposal to expend £27,000 in improving the present corporation galleries, which were admittedly unsuitable for their present purposes as an art gallery, as showing that if the recommendation of the committee were not carried out the money would be less judiciously expended elsewhere. Mr. Walls moved as an amendment that the recommendation of the committee be not agreed to. The discussion, as we have said, proceeded altogether on the question of cost, and need not be further indicated in these columns. The only argument of the economists was that money should not be spent if it could be retained in the pocket of the corporation; but the fact was overlooked, that by following this policy in the past something like £100,000 has been added to the expenditure which, in any case, the city must now face. After the discussion continued for three hours, the Council adjourned till Thursday (yesterday) without coming to any decision.

The town council met again on Thursday, and resumed consideration of the question of the New Municipal Buildings Scheme. The discussion lasted upwards of four hours. In course of the debate, Mr. Jamieson submitted the following motion:—That the Council disapprove of the motion contained in the minute of 25th February; resolve that the limit of the buildings to be erected under the Municipal Buildings Act of 1878 be limited to the area already purchased; and that it be submitted to the Committee to consider the purposes referred to in the Act for which accommodation be provided, and to instruct Mr. Carrick to prepare a block plan to indicate how that accommodation may be provided, leaving freedom to competing architects to arrange how that accommodation may be best obtained; and that the competition for the new designs be an open one, and that the cost should be increased to about £250,000.

Mr. Jackson moved to the effect that a remit be made to the committee to get prepared by the city architect, in addition to the plans upon which the recent competition was based, an alternative sketch plan, treating as the proposed building area, the block to the west of John-street, the solum of John-street, and the area east of John-street represented by the required frontage of that street; said sketch plan to show how the amount of building accommodation necessary for municipal purposes may alone be proceeded with at once, but in harmony with the building plan, capable of extension if required within the area thus described, and all in accordance with the Municipal Buildings Act of 1878, and to report. The Lord Provost withdrew the motion he proposed at the last meeting in favour of Mr. Jackson's amendment, and on a division between the amendments of Mr. Jackson and Mr. Jamieson, the latter was carried by 28 to 17 votes. Mr. Wall's amendment was thereupon withdrawn, and that submitted by Mr. Jamieson became the judgment of the Council.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

ANDOVER ARCHÆOLOGICAL SOCIETY.—At a meeting of this Society, held at the Town-hall, Andover, on the 19th, a paper was read by Mr. Drinkwater Butt on "Mediæval Architecture," and was followed by a discussion in which the Rev. C. Collier, the Rev. H. C. M. Barton, and other gentlemen took part. The paper was profusely illustrated with drawings by the author.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The sixth meeting of the session was held last Wednesday week, Mr. Thos. Morgan, F.S.A., in the chair. Mr. Worthington Smith exhibited a pre-historic quern from Thetford, and two large flint implements from the gravel drift of the cemetery, Southampton. Mr. Allen drew attention in reference to the recent congress, to the view of Stonehenge, in 1588, in the "Particular Description of England," by Wm. Smith, Rouge Dragon. This somewhat fanciful sketch shows several of the top stones as being then in position. Mr. Saunders described a specimen of the Dutch "Thunder Glasses," which are but seldom seen in England. The emission of water from a central spout gives notice of atmospheric change. Mr. Loftus Brock, F.S.A., described the progress of the discoveries at Leadenhall Market. Large masses of Roman walls continue to be exhumed, and these prove to be the foundations of a building of large size, probably of basilica form, which appears to have had an eastern apse, with two transept-like chambers to the south, with other buildings to the west. Traces of four distinct burnings have been found. The first paper was by Mr. Francis Brent, a description of an interment found at Castle-street, Plymouth, and which proves to be of Romano-British date. A large urn was found covered with slabs of stone set sloping over it. The discovery was made in the heart of the present town, in preparing for an iron column of a warehouse. The second paper was by Mr. Chas. Watkins, who described in detail the portion of the old City rampart of London, recently discovered at Houndsditch, and removed. About 70ft. of the wall were cut through, and the lecturer minutely described the construction. The wall was one of Kentish rag-stone, bonded together with the usual bright red tiles, and having a chamfered plinth on the outer side. A discussion ensued, and the fragments of mortar and brick examined. The work was pronounced to be of Roman date, and it corresponds very closely to the portions of the well recently found in the Tower and in America-square. The paper was illustrated by a large series of drawings. The third paper was by Mr. J. Romilly Allen, F.S.A. (Scotland), and was on Pre-historic Structures at Tealing, Forfarshire. There is a perfect underground house, and many stones with cup and ring markings.

COMPETITIONS.

SELBY SCHOOLS, &c.—The designs placed first in this competition are by Messrs. Wm. Waddington and Son, of Manchester and Burnley—motto, "Experientia"; the second and third premiums being awarded to Mr. C. O. Ellison, of Liverpool—motto, "Liverpool," and Mr. E. Birchall, of Leeds—motto, "Raikes," respectively. The scheme includes the erection of new Wesleyan schools and remodelling the present chapel, the proposed outlay being about £4,000. The works will be proceeded with forthwith.

More than Fifty Thousand Replies and Letters on subjects of Universal Interest have appeared during the last ten years in the ENGLISH MECHANIC AND WORLD OF SCIENCE, most of them from the pens of the leading Scientific and Technical Authorities of the day. Thousands of original articles and scientific papers, and countless receipts and wrinkles embracing almost every subject on which it is possible to desire information have also appeared during the same period. The earliest and most accurate information respecting all new scientific discoveries and mechanical inventions is to be found in its pages, and its large circulation render its the best medium for all advertisers who wish their announcements to be brought under the notice of manufacturers, mechanics, scientific workers, and amateurs. Price Twopence, of all booksellers and newsvendors. Post free 2½d. Office: 31, Tavistock street, Covent-garden W.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. R. M. TUTTLE, of 13 and 15, Laight-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Cases for binding the half-yearly volumes, 2s. each.

NOW READY,

Handsomely bound in cloth, Vol. XXXIX. of the BUILDING NEWS. Price Twelve Shillings. Order at once, as only a limited number are bound up.

N.B.—Cases and vols. must be ordered through a bookseller or newsagent, as the regulations of the Post-office prevent them from being sent by post.

RECEIVED.—J. W.—G. W. G.—T. D.—J. W. L.—G. P. S. W. P. C.—R. M. and Son.—C. H. S.—W. and J. R. F. and Co.—E. and R.—L. and Son.—G. E. H.—R. and R.—F. A. B.—E. J.—J. B.—T. L. and Son.—C. B.

PRO BONO PUBLICO. (Your letter, though sent to us, is addressed to a contemporary. Our inference is that it has been sent to more than one of the professional journals, and it would, therefore, be wasting our space to insert it.)—N. E. R. (Returned; the clerk of the works was, we imagine, employed by the architect?)

Correspondence.

JERRY BUILDING.

To the Editor of the BUILDING NEWS.

SIR,—A very great deal of nonsense appears in the various professional journals from time to time, your own included, in the shape of correspondence, on the evils of bad or "jerry" building. Somebody buys a house for, say, £400, and thinks he has been keen over his bargain, and possibly boasts that he has got it "cheap," until he has lived in it for a few months, and finds that what in his ignorance he took for broadcloth is only "shoddy," and the poor jerry builder too often gets blamed for what is the parsimony of the house-buying portion of the public.

To illustrate my meaning, I will suppose a case in which a builder erects two houses adjoining, practically the same in plan and elevation, and also in finish, so far as moulding, cornices, painting, &c., is concerned.

In what I will call No. 1 he uses every precaution to secure a substantial, sanitary house. The whole area, if at all damp or of made ground, he covers with a bed of cement concrete, and builds his wall up to above the ground-line in cement, on which he places a good vitrified damp-course, by Taylor or some other good maker, on a layer of asphalte, using it also on all sleeper and dwarf walls, for floors and steps. He buys nothing but well-burnt and good-shaped bricks, and is careful to get a sharp fresh-water or pit-sand, free as possible from loam, and builds fire clay linings into all flues. He also uses for joists to first floor, 11in. by 3in.,

and 11in. by 4in., sound redwood deals, and not less than 9 by 3 after, and all well-stemmed, covering them with 1¼ grooved and tongued flooring-boards in narrow widths, and uses equally durable timber in his roofs and his partitions, properly trussing and bolting them; he also uses for his gutters, aprons, and flashings, 7lb., 6lb., and 5lb. lead, and secures his slates with 7lb. copper nails, and laid to a 3in. lap. In plastering he uses lath, and half and double lath, and plenty of hair, and sees that all walls and partitions are plastered to floor-line, at back of skirtings, &c., and fixes grounds for all architraves and skirtings, and has all window-frames properly bedded in. He also lays in sound sanitary pipes for his drains, trapped in a proper manner in the proper place, and for his water service uses the heaviest weight of pipes, and remembers that during the next or other winters severe frost may be experienced, and does a host of other things that would be specified by a competent architect, *for he intends to live in it himself.*

In house No. 2 he commences with the cheapest brick he can buy, half burnt, and wholly bad, using for mortar the surface-soil of the site, road-mud, or other available rubbish, and "runs it up" as quickly as possible; no concrete, no damp-course, flues carelessly pargetted with the same mortar, and often not at all; for joists using 7in. by 2½in. battens, and less for the smaller rooms, with ⅞in. flooring, and with roofs and partitions to match. Gutters and flashings of No. 10 zinc, slating with 1½ lap, and iron or zinc nails, water-pipes the lightest he can get, and his waste and overflow pipes carried into w.c. trap or soil-pipe for economy. In the matter of drainage he lays a lot of pipes in a trench, and lets them take their chance, and does a hundred other "scamping tricks" that the district surveyor does not, and, in fact, is utterly unable to prevent.

On totalling up the cost he finds that, allowing a fair profit on the transaction, he can offer No. 1 for £1,000; but at the same time he explains to the would-be buyer that he can take for the next house something like £900, and the bargain is struck, and the builder knows that if he builds a half-dozen more in the same style, they would all be off his hands before No. 1, provided he wished to sell it.

As soon as the house begins to go wrong, say, after the first heavy day's rain, or a week of very hot weather, or a few degrees of frost, the purchaser begins to use unparliamentary language about the builder, whereas, for a moderate fee, a respectable surveyor would have pointed out and explained to the would-be purchaser, the respective merits and demerits of the two houses.

Your house-buyer or renter, for that matter, too often wants a larger or grander house than his capital or income will warrant him in bargaining for, and as a matter of choice he takes the showy imitation, in the same way that he buys his paste "diamonds" and zinc "bronzes," and shoddy "sealskins." Judging from my own observation, there are as many "jerry" buyers as "jerry" builders in the world.

If a man wants a good house, let him build one, employing a competent person to superintend it, or employ a respectable builder at a fair price, which may easily be done with the help of one or other of the many building societies in operation, and he will then be doing something to stamp out the offending "Speculator," and the still more objectionable financier behind him, who gets the lion's share of the plunder without the odium attached to the business.—I am, &c.,

S. B. Burton.

Newcastle-on-Tyne.

FROZEN WATER SUPPLY AND KITCHEN BOILER EXPLOSIONS.

Sir,—Mr. Buchan's statement in your last issue, that kitchen boilers are usually supplied from the cold-water cistern, is most astonishing, and must, I think, account for many of the explosions which occur in the North. *To prevent the freezing of boiler-supply a warm circulation must be maintained through all the pipes.*—This can only be properly effected by having a hot-water cistern connected with the boiler by *two pipes* exactly as for hot-water heating apparatus. The cistern must, of course, be high enough to supply warm water where required, and it will form the expansion-box; no other provision for expansion is necessary. The *flow-pipe*, from which all cocks draw off, must go *from the top of the boiler*, and (that there may be no dead branches like the pipe I to the scullery) must travel to all places which are to be supplied with hot water, and, finally, be connected to the bottom of the cistern. The *return-pipe* may travel in any direction back *to the bottom of boiler*. Thus, when there is fire, circulation will be kept up in the whole length of the pipes. All would be warm, and freezing would be out of the question. There is very little, if any, use in Mr. Buchan's hot-water cylinder, M, and the *third* circulating pipe, G, is worse than useless, for it would tend to prevent circulation in the pipes D and F, and thereby promote freezing.

If a cock is kept trickling, to prevent freezing of cold supply, it should be one in connection with cold-water cistern, not with the hot. Waste of hot water must mean loss of heat.—I am, &c.,

J. M. Gething, architect.

BURSTING OF PIPES AND BOILERS.

Sir,—A very simple and effective plan to prevent the bursting of water-pipes when exposed to severe cold is to form a small air-chamber at or near the part affected. If the pipe runs horizontally, a short branch standing vertically to it thus

will answer well, but if the pipe be vertical it should be formed by either continuing the pipe beyond the draw-off or putting a short branch out at the side, and then turning it up parallel to the pipe thus—

If, however, it be of a hot-water pipe from a hot-caused to dip being turned up; otherwise the bubbles of steam will rise into the chamber, force out the air, condense, and finally fill the chamber with water. With the dip, however, this can scarcely arise. The increase in bulk caused by freezing water is very slight, not exceeding about 12 in 10,000; the chamber, therefore, need not be large. Six inches of pipe of the same size as the main will, in most cases, be ample. Due allowance, however, must be made for the compressing of the air if the head of water be great. A similar contrivance will prevent the rattling often caused in pipes when the taps are quickly shut off. This is generally most easily done by turning up the endof the pipe thus—

for about 6in. I have found this ample to stop all rattling, even with a head of 50ft. of water.

The bursting of boilers is not, however, caused by split pipes, but from the outlet and inlet-pipes being frozen up, and all outlet for the steam being cut off. Safety-valves have, again and again, been recommended. Unfortunately, safety-valves too often get stuck fast when wanted. A cheaper and much more reliable plan is to insert in the boiler a small fusible plug. If the alloy of which the plug be formed be made to melt at a temperature of about 250° Fah., it will be impossible for the steam to be raised beyond 16lb. above atmospheric pressure, or equal to a head of water of about 30ft.—a height much less than the ordinary run of hot-water boilers. If in conjunction with this it be made an invariable rule never to take a draw-off direct from the boiler, but from the circulating-pipes only, it will be impossible to empty boiler save by boiling the water away. This cannot arise unless there be a free vent for the steam, and, consequently, it will be scarcely possible to have a burst boiler from any other cause than by letting water into it when it is either red-hot, or nearly so. In this case, no contrivance will prevent an explosion, and if the cook has not sufficient gumption to prevent such an occurrence, the master or mistress should find it, or blame themselves only if their boilers burst.—I am, &c., T. E. Julian.

"WONDERFUL GRATE."

Sir,—Many of your readers as well as myself would be very much interested in the brief account given of the above last week, and if it does all that its inventor claims it is indeed a "wonderful grate." There are a few points which your readers would doubtless be glad to know—

1. Does the heat from the fire in any way carbonise the coal in the feeder, as, if so, tar would be formed, which would be a great nuisance?

2. If the fire required feeding while burning, would not the removal of air-tight door cause a draught and fill the room with smoke, &c.?

There are several other points which should be considered, such as (1) the facility for sweeping chimney, (2) the lowness of the front hood causing the heat to pass up the chimney.—I am, &c.,

West Bromwich, Feb. 21. J. T. E.

[Several sentences embracing inquiries as to makers' names, prices, &c., have necessarily been struck out. "J. T. E." or any other readers should apply direct to the makers, whose advertisement appears on our front page.—Ed. B.N.]

EXTERNAL SOIL-PIPES.

Sir,—I am afraid that Mr. White's letter on p. 192 has been written too hastily, and before he had time to digest my explanations given at p. 165. I there showed that the sewage-polluted air blown off into the atmosphere from an inside soil-pipe was several times the *quantity* and also worse in *quality* than the sewage air from an outside soil-pipe; consequently, I am correct in asserting that "the inside soil-pipes generate and discharge into the air more bad air than the outside ones."

As the subjects of the highest importance for us all, permit me to call attention to another important point, in this relation, and one which I am not aware has yet been publicly referred to, viz. this: An inside soil-pipe has generally a speedy, constant current of air through it, the effect of which is soon to *dry up* the interior, as the wind dries clothes upon a blowy day. Now, if the water coming down the soil-pipe was pure, this would not matter; but the water is foul and contains large quantities of organic matter, and possibly some particles of particulate contagia. Now, so long as the inside of the soil-pipe is wet, these particles may be held or moored to the side of the pipe; but as the water evaporates, or is carried off by the current of air, then many of these particles may break loose from their moorings and get carried along with the current of air where it goes; and so, if a leak existed in the soil-pipe inside of the house the air from the soil-pipe might soon carry with it thousands of organic particles—some of which may be particulate contagia—into the atmosphere within the house, the results of which may be baneful to the inmates.

The greater heat of the inside soil-pipe is more favourable to fermentation or putrefaction, and to the generation and distribution of foul organic matter and particulate contagia than the greater coolness of the outside one: hence the outside one is the safest.

For Mr. Read, C.E., at p. 192, to speak of the "risk of passing your closet junctions through the outer wall to connect them with the vertical outside soil-pipe" is simply absurd. There is no particular "risk" in the matter, and, if wanted, an outside soil-pipe can quite easily be protected from frost. In the case of chokage in the vertical pipe, these outside side junctions are often of great service.

It is another mistake of Mr. Read to suppose that: the warmth of the house facilitating the action of the ventilating-pipe is a benefit to the inmates. People forget that while fresh air entering one end of a *short* soil-pipe may come out not very impure at the other end, yet the same air, after passing through a *long* soil-pipe, comes out highly impure and dangerous, and especially if the pipe be warm. So that in dull or close weather, when there is no wind to carry off the aërial impurities, to have thousands of inside soil-pipes each discharging some hundreds of feet of bad air into the atmosphere is anything but sensible, and is scarcely creditable to our *science*, and for Mr. Read to advocate such ideas, in combination with making the house drains ventilate the sewers (which idea is not new, as he imagines) is very bad *sanitary* engineering, however "civil" it may be.

This combination of the house-drains with the sewer, which Mr. Reid advocates as a grand new idea of his own, is the plan which was in use at Croydon in 1875, when Dr. Buchanan examined that town, and which plan of "laying on"—as he expresses it—the sewer air to the houses was one cause of the wide and rapid spread of the fever, owing to the fact that the sewer air which flowed along the house drains, carried with it the *germs of the fever*. To prevent this in future Dr. Buchanan recommended that:—

"Thirdly, the direct connection of houses with sewers must, wherever possible, be interrupted; and an efficient system of ventilation be applied to every house-drain." See "Reports of the Medical Officer of the Privy Council and Local Government Board," new series, No. VII., for 1875, published in 1876. I would recommend Mr. Read to peruse this masterly report on Croydon; it may help to prevent him from again recommending plans which have already been weighed in the balance and found wanting. It also shows how much, in such a matter as sewer ventilation, all engineers may learn from an able physician.

The "fundamental error" in the ideas I have condemned is mere writing without due thought, and not having the right knowledge and experience.—I am, &c., W. P. Buchan, S.E.

LYVEDEN NEW BUILDING.

Sir,—In the description of "Lyveden New Building" in your issue of Feb. 4, you request a suggestion as to the explanation of the letters "E. T. N." (or "T. N. E.") in the wreath surrounding one of the emblems. This does not seem difficult of interpretation if we consider it in connection with the adjacent design, round which are the words "Esto Mihi." In this we have the emblems of the sacrifice of the Crucifixion, typical of the redemption and salvation of mankind, with the initials of the words, "Jesus Hominum Salvator" (or the first three letters of the Greek name Ιησους), and the pious builder says, "Esto Mihi"—"May it be so for me."

In the design under discussion, we have the Greek Χρ, the first two letters, and the emblem of the man Christ, who was born into the world to save sinners; and so Sir Thomas Tresham surrounds it with the initials of words declaring such fact to the reader, "Tibi Natum Est"—"He was born for thee."—I am, &c.,

EDWARD B. KNOBEL.

Bocking, Braintree, Feb. 18.

BUILDING STONES.

SIR,—In your issue of the 11th inst., Mr. Chas. Trask makes a slight error in stating that the spire of the church of St. Mary's, Truro, was of granite.

The stone came from St. Stephen's, and is of quite a soft nature.

There are churches in Cornwall I could mention built of granite, which have been standing as much as 800 years, and still show the tool-marks in the stone.

This even would hardly be a criterion of the durability of granite, as there were no proper quarries in those days, and only surface-stone was used for buildings, which is very inferior to the good blue stone out of the quarries nowadays.—Yours, &c., D. H.

SIR,—Without entering into the question of the comparative merits of Doulting and Portland oolites, we shall be obliged by your inserting a word or two in reference to Mr. Trask's remarks in your issue of the 12th inst., concerning the state of the granite used in the old tower of St. Mary Church at Truro.

One hundred years ago granite was not "quarried" at all in Cornwall, but surface-stone was exclusively used for all building purposes. A great deal of this surface rock, or "moor stone," is of very inferior character.

There is also a kind of granite found in the St. Stephen clay district, which is decidedly perishable when used for external work, and cannot be compared with the granite produced from the deep quarry workings, such as those of the Mabe, Constantine, Stithians, and some other districts.

It will be a pity if any inferior material is used in the construction of so fine a work as the new cathedral at Truro is designed to be.—We are, &c.,

JOHN FREEMAN AND SON.

Penryn, Cornwall, February 16, 1881.

TWO CAUTIONS.

SIR,—Architects should be on their guard against the wiles of an impostor who has been practising for some time on the better nature of the architectural profession. After an extended London experience he is now "working" the provinces, and has been heard of at sundry places in the North. He is in appearance tall and straight, and is in habit of using freely the name of Mr. Alfred Waterhouse, R.A. The impostor's name is subject to variation. He ostensibly applies for work, but ends in begging. It would be probably a real charity to hand him over to the police.

Another caution I venture to give at the present time, when architects have so much to do with limited liability enterprises, and that is, to beware of accepting the so-called "fully paid-up shares" in return for their services. Unless specially registered, such payment is not legal, and may, in case of the company "winding up," result in an unpleasant surprise—the being called upon to "pay up" for these same shares. I know those who are in this dilemma at present time. In some cases in which actions have been brought, the judge, I suppose by rule of equity rather than law, has decided in favour of the shareholder; but it does not always happen so, and it may be that the unfortunate man not only loses the original sum, but has to change places, becoming a debtor instead of creditor, and is mulcted a second time—a double loss and costs!—I am, &c., M.

SANITARY SCIENCE IN ITS RELATION TO CIVIL ARCHITECTURE.—WARMING AND VENTILATION.

SIR,—In your issue of last week, containing the adjourned discussion on Mr. E. C. Robins's paper on the above subject, I was particularly struck by the remarks made by Mr. Henry Dawson on the method of ventilating rooms by means of leading cold air in a pipe to within a few feet of the ceiling, in which he says the cause of failure is a down-draught in all instances unless the ceiling be at least 20ft. in height. Now, Sir, I know several cases in which this method is used, both in private houses and offices with the greatest success. In each case the method employed is as follows:—A 6in. metal or other pipe is carried from the floor level to within about 3ft. of the ceiling at the other end of the room over the fireplace, and at the level of the ceiling is placed one of Mr. Boyle's admirable ventilators leading into the smoke-flue. I never at any time heard the slightest complaint of a down-draught. They have been in use during the whole winter, and the ceilings range from 11 to 13ft. in height in both cases.—I am, &c.

VENTILATION.

Intercommunication.

QUESTIONS.

[6405.]—**The Institute Gold Medal.**—Will anyone who really knows say what are the qualifications for the gold medal of the Institute? A well-known architect told me some years since that he thought it would be much fairer and more satisfactory to all concerned if it were shot for annually, like the Queen's Prize, at Wimbledon; and another said to me a few days since he was of opinion that at a recent award it must have been tossed up for! Also, what is the intrinsic value, and is it true that since Mr. Ruskin's refusal it has been a work of difficulty to persuade any one to take it?—MEDDLER.

[6406.]—**Felting a Roof.**—Will any of your readers kindly inform me whether it is necessary to board first when laying felt under a tile or slate roof when the rafters do not exceed a foot apart!—A SUBSCRIBER.

[6407.]—**Cubing a Building.**—Will some one tell me if, when cubing a building to find the cost, the foundations and roof are taken into account? If not, what part of the building?—A SUBSCRIBER.

[6408.]—**Architectural Tour.**—Will any correspondent kindly suggest a book to study with a view to going a measuring and sketching tour in Normandy and Brittany? One which would suggest the best buildings to copy would be of most value to—PEACOCK.

[6409.]—**Milled Lead.**—Lead for a flat is specified 5lb. I find it weighs only 4½lb, varying from 4lb. 7oz. to 4lb. 9oz., the samples being taken from centre of sheets. Is 4½lb. lead manufactured purposely, and shall I be wrong in condemning such lead as does not approximate more closely to 5lb. than the above?—J. T.

[6410.]—**Clerk of Works.**—Will someone inform me if it is the duty of the clerk of works, or of the contractor's clerk, to make out the account of extras at the end of the job?—N. E. R.

[6411.]—**Eaves.**—Having a dispute with a neighbour as to the allowance for an eaves drop, which in reality measures about 6in., yet I claim 9in., can some reader of this journal inform me what projection is the general rule or law, and whether any difference in the use of slates and tiles!—AN OLD SUBSCRIBER.

[6412.]—**Charges for Abandoned Plans.**—An architect is selected in a limited competition by the members of a school-board and becomes appointed architect to the board. Four schools are erected in different parts of the town, two of which passed the Educational Department without any alteration, 9ft. super being allowed for each child; but the plans for the other two schools were not passed by the Educational Department, and their lordships gave orders that 10ft. must be allowed in the mixed school-room and 8ft. in the infants, instead of 9ft, as allowed in the other schools, necessitating a different arrangement in each case. Of course, the plans had to be entirely re-drawn. The buildings have since been erected accordingly, at a cost of £2,300 and £700 respectively. "Constant Reader, R.," would feel obliged if some of your correspondents would say what would be a fair charge to make for the abandoned plans. The usual commission has been paid on the cost of the schools as erected. The estimated cost of the first or abandoned sets of plans was £2,200 and £760.—CONSTANT READER, R.

[6413.]—**Green Slates.**—What are the best green slates to use, to work in courses with Bangor 24 × 12 or 20 × 10, reliable as to colour and wear?—BUILDER.

REPLIES.

[6370.]—**Chambers' Proportions.**—These proportions are often used, but some architects prefer to take the particular examples of the orders they adopt and carry them out in important Classical buildings. Examples, for instance, of the Roman Ionic will be found to differ in the proportions of the parts. If we take the Corinthian, the usual height is not exactly determinable on account of the ruined state of the best temples, but the height usually given is from 2½ to 3 diameters. These differences being very common, it is sufficient for the architect to take the proportions laid down by Chambers, though Vitruvius, Scamozzi, Palladio, and Vignola are generally followed as being older authorities.—G. H. G.

[6395.]—**Oak Paling.**—Use Stockholm tar, which contains creosote, and has strong preservative qualities, while, being transparent, it shows the grain of wood.—G. H. G.

[6396.]—**Bell Turret.**—For a turret of the description you furnish, the corner standards may be at their smallest section, 5in.; but it is impossible to give a satisfactory answer without seeing the elevation of the turret and the mode of construction intended, especially the bracing or filling in between standards. G. H. G.

[6397.]—**Area Walls.**—The boundary walls are not necessarily the area walls. If the tenant has to keep the former in repair under the lease, I do not consider that he is called upon to repair the area walls, if by these are meant walls round the house, serving as retaining walls, and within the boundaries. As the landlord has to keep main walls and timbers in repair, it seems to me that he is certainly liable for damage by frost to the area walls, which belong more properly so the house. The question is whether by the term "boundary walls" the area walls are included. I should say not.—G. H. G.

[6397.]—**Area Walls.**—The retaining walls can hardly be boundary walls, so that the repair should be executed by the landlord.—H. L.

[6399.]—**Filtration.**—Parry's "Water: its Composition and Collection," contains information of a general kind, and Capt. Galton's manual on "Sanitary Construction" may be consulted, but there is no authoritative treatise on the special subject that I am aware of.—G. H. G.

[6401.]—**Modulus of Rupture.**—I cannot find the article in Rankine, but believe the formula is to enable the modulus of rupture to be found by experiment. To calculate the strength of the beam it should be borne in mind that the top and bottom halves of it act in opposition, with an average stress of half the greatest stress, *i.e.*, half the modulus of rupture, which stress is concentrated at points ⅔ of the distance from the neutral axis to the top and bottom edges of the beam respectively. We have thus $f = \left(\frac{l \cdot w}{4 \cdot h} \div a\right) \times 2$, where f = modulus of rupture, l = length in inches, w = breaking weight in lbs., h = two-thirds of the depth for reason above, a = area of top or bottom half of beam. The $\frac{l \cdot w}{4\,h}$ is the ordinary formula for beams with load in centre, and is multiplied by 2 on account of the average stress being half the greatest. The formula stands thus:— $\left(\frac{12 \times w}{4 \times \frac{2}{3}} \div \frac{1}{2}\right) \times 2 = 18\,w$.—E. WEBSTER.

[6401.]—**Modulus of Rupture.**—Let A B be a beam of uniform rectangular section, of length x, breadth b, and depth d, loaded at centre with the weight W, then we must have external bending = internal, that is, $\frac{W}{2} \cdot \frac{x}{2} = \frac{f}{y} \mathrm{I}$. Let $y = \frac{x}{2} = \frac{f}{\frac{x}{2}} \frac{1}{12} b x^3 = \frac{f}{6} b x^2$. Now let x = 1ft., $8 = 1''$, $d = 1''$, then $\frac{W\,12}{4} = \frac{f}{6}$ or $f = 18$ W. Thus, if W be made just sufficient to break the beam, we know f, which is called the "modulus of rupture."—H. S, Belfast.

[6402.]—**Quantity of Stone in Spire.**—"Novice" is right. The quantity for each stone should be the smallest rectangular block out of which it can be cut, great care being taken that the quoin stones are carefully measured.—H. L.

[6402.]—**Quantity of Stone in Spire.**—In taking the cube contents of spire the stones ought to be measured to the extreme dimensions as they come from the saw of the banker, as, of course, the waste in working it must be allowed.—G. H. G.

[6403.]—**Builder's Accounts.**—I prefer subtracting the smaller from the larger items of the same description in the abstract, and carry the difference to the bill of extras In the case mentioned 20 yards is the amount to be billed out.—G. H. G.

[6403.]—**Builder's Accounts.**—If the extras and omissions are composed of exactly similar items the nett results can be shown; but as, in most cases, only two or three items could be so adjusted, it is usual to bill the extras and omissions in full, making a summary at the end.—H L

[6404.]—**Sanitary Engineering.**—A weight falls 16·1ft. in one second, 64·4 in two, &c., that is, $16{\cdot}1 \times t^2$, where t = time in seconds. The time required for passing over the horizontal space of 1ft. at the velocity of 1·6.t. per second is $\frac{1}{1{\cdot}6}$ seconds, and the vertical space fallen in that time is $16{\cdot}1 \times \left(\frac{1}{1{\cdot}6}\right)^2 = \frac{16{\cdot}1}{2\,56} = 6{\cdot}29$ feet. The other formulæ in like manner.—E. WEBSTER.

[6404.]—**Sanitary Engineering.**—The "drop" in the invert necessary to allow a liquid at certain velocities to overleap, so to speak, a given opening, is determined by the resultant of two forces, the momentum of the water in sewer, and the force of gravity. The problem is discussed in works on hydro-dynamics.—G. H. G.

PARLIAMENTARY NOTES.

OPENING MUSEUMS ON SUNDAYS.—In the House of Lords on Tuesday, Lord Dunraven moved a resolution in favour of opening the Museums and other national institutions on Sundays Lord Shaftesbury moved as an amendment that such institutions should be opened on week-day evenings up to ten o'clock. The Duke of Somerset supported the resolution, but would exclude the Museum library from its operation. The Archbishop of Canterbury pointed to the fact that the experiment had failed at Maidstone after being tried for three years. He believed that the sense of the country was against the proposal. Lord Rosebery argued that the change proposed might do good, and could not possibly do harm. Lord Cairns reminded their lordships that the House of Commons, which had to provide the means, had repeatedly rejected this suggestion by large majorities. Lord Granville contended that the experiment had succeeded wherever it had been tried, and that the violent opposition which the motion formerly encountered had utterly disappeared where such institutions were now open on Sundays. After a few remarks from the Duke of Argyll against, and by Lord Thurlow in favour of, the motion, the House divided, and having by 41 to 34 rejected the motion, subsequently agreed to the amendment.

ORDNANCE SURVEY.—Mr. Pugh asked the First Commissioner of Works in the House of Commons on Tuesday, what steps had been taken since last session to accelerate the completion of the Ordnance Survey. Mr. Shaw-Lefevre said: In consequence of the promise given last session, every endeavour has been made to accelerate the survey. A supplementary estimate for £5,000 was voted at the end of last session. I shall ask shortly for another supplementary estimate for the current year of £3,000, and for next year the vote asked for will be £40,000 in excess of last year. This will enable a very considerable acceleration of the survey, as

much as will be possible within the time, and with some further increase in subsequent years the survey may be completed by the year 1890.

LIGHTING THE NATIONAL GALLERY.—In reply to Mr. D. Grant on Wednesday, Mr. Shaw lefevre said that the first Commissioner of Works could not order the lighting of the National Art Gallery, so that it might remain open on weekdays until ten o'clock, without the concurrence of the trustees, and it was quite impossible for him to do so against their opinion. They objected to gas as dangerous to the national collection, and he did not think that there was at present sufficient experience to decide upon the suitability of the electric light.

LEGAL INTELLIGENCE.

CASE UNDER METROPOLITAN BUILDING ACT.—"SHOP FRONTS" (Section 26, Rules 2, 3, and 5.)—Mr. Bedford, the builder of an extensive block of buildings, attended before Mr. Paget on the 11th inst., at the Hammersmith Police-court, in answer to a summons taken out by Mr. T. E. Knightley, district surveyor for Hammersmith, to show cause why he should not separate eight shop-fronts, facias, and cornices, with fireproof pilasters and trusses, and limit projection of shop-fronts to 5in. from external walls. Mr. Knightley conducted his own case. Mr. J. Haines, solicitor, appeared for defendant. Mr. Knightley stated that as at present constructed, the pilasters between shops were of wood, and that the facias and cornices (also of wood), were continuous from one end of the buildings to the other, calling his assistant to prove this, and also that the shop-fronts projected considerably more than is permitted by the Act. Mr. Haynes called witnesses, one of whom admitted that the pilasters had been as described, but that an alteration had been commenced; whereupon the magistrate allowed Mr. Knightley his costs for the day, adjourning the summons for the requirements of the act to be carried out; after which, the parties met on the works, and defendant undertook to make application to the Metropolitan Board of Works for "special sanction."

LIABILITY OF VENDOR OR PURCHASER IN CASE OF FIRE.—"RAYNER V. PRESTON."—In this appeal to the Supreme Court on Monday, from a decision of the Master of the Rolls, a question of some interest to vendors and purchasers of houses is raised—viz., whether, when, after a contract has been entered into for the sale of a house, and before the completion of the purchase, the house is burnt down, the purchaser is entitled to recover from the vendor money which he has received from an insurance company under a policy which he had before the agreement for sale effected on the house, the purchaser, when he entered into his contract, not knowing of the existence of the policy, to which the contract contains no reference, and the insurance company knowing nothing of the contract for sale. The Master of the Rolls, conceiving himself bound by a decision of Lord Eldon in 1801, in the case of "Paine v. Meller" (6 "Ves." 349), and a decision of Vice-Chancellor Kindersley in 1864, in the case of "Poole v. Adams" (12 "Weekly Reporter," 683), held that the purchaser could not recover the money from the vendor. The purchaser appealed. Their Lordships (Lords Justices James, Brett, and Cotton), reserved judgment.

A CONTRACTOR'S CLAIM.—COMPETITION ESTIMATES.—BROWN V. THE BRIDLINGTON LOCAL BOARD.—This action was heard in the Chancery Division of the High Court of Justice, before Vice-Chancellor Sir R. Malins on the 17th inst., and was a builder's claim under a contract for the erection of two mortuary chapels and a keeper's lodge for the Bridlington Cemetery. The local board selected in competition Mr. Smith, of Nottingham, as their architect, and he prepared specifications, according to which he estimated that the buildings ought to be completed for £2,500. The plaintiff's tender of £5,912 was the lowest, but after cutting down the work to £4,788, it was accepted, and the work was to be completed by the 1st of January 1877, the date of tender being June 10, 1875. The defendants took possession on September 18, 1879, alleging that the contract had not even then been completed, and they now stated that they had expended £144 upon work which ought to have been done by the builder. The plaintiff represented that at that time, through alterations and additions directed by the architect, he had spent upwards of £10,000 upon the building, that the work was practically finished when he was deprived of possession, and that the contract would have been carried out in due time but for the new orders and directions, a masons' strike, and bad weather. He had received £4,235 7s. 8d., and held certificates from the architect for work done which would entitle him to a further sum of £1,238 18s. 7d., but he claimed about £6,000 beyond that. The defendants denied all liability for any payments beyond that which had been already made, and they had filed a counter-claim, by which they sought to set off against anything that might be found due to the plaintiff a sum of £1,960 as damages for delay in completing the contract. On the suggestion of the Vice-Chancellor it was arranged that, all charges and imputations of fraud being withdrawn, and the certificates and awards not being insisted upon as binding, there should be a reference to Sir Henry Hunt to determine, having regard to the circumstances of the case, how much, if any, money remained due to plaintiff. The costs were reserved.

A PARTY-WALL.— HACKMAN V. DAVEY.—This was an action recently tried at the Brighton County-court to recover £33 3s. 11d. under the following circumstances:—The plaintiff is a builder at Brighton, and he erected several houses in Hastings-road. Adjoining the last of the plaintiff's property defendant erected a house. The party-wall of the plaintiff's house was an ordinary one, erected partly on the plaintiff's and partly on the defendant's ground; and the defendant used it in the ordinary way to support his house. There was no agreement between the parties. Plaintiff thought defendant ought to pay part of the cost of the erection. His Honour said the defendant had a perfect right to use that portion of the wall built on his land for any purpose whatever, or even, if he choose, to split the wall down, taking away that portion which stood on his land, even if he rendered the remaining portion useless.—Verdict for defendant with costs.

NON-ACCEPTANCE OF ENGINEER'S CERTIFICATE.—The arbitration case of Hutchings and Berry v. the Corporation of Honiton was brought to a close after four sittings before Mr. E. Vigor on Friday. The plaintiffs contracted to construct works of drainage in Honiton from the plans of Mr. Ellis, engineer, who reported to the corporation that they had completed the work to his satisfaction. On behalf of the corporation it was contended that certain works had been omitted, amounting in cost to £6 5s. only, and plaintiffs not being able to get the money in full, brought the case now fully heard. The arbitrator has yet to give his award. It is stated that the costs will be many times the amount in dispute.

PAVEMENT LIGHTS—HAYWARD V. HAMILTON AND ANOTHER.—This case was argued on Wednesday in the Exchequer Division, before Mr. Baron Pollock and Mr. Justice Hawkins. This case was an action to recover damages for the infringement of a patent of the plaintiff's for improvements in pavement lights, and was tried before Mr. Justice Hawkins in November, 1879. His Lordship then directed a nominal verdict for the plaintiff with 40s. damages on the findings of the jury; but his Lordship did not enter judgment for either side. There were on Wednesday two cross-motions, one by Mr. Webster for judgment for the plaintiff, and another by Mr. Aston, who contended that the findings of the jury were really in favour of the defendants, and, in the alternative, for a new trial on the ground that the verdict was against the weight of the evidence. The plaintiff's contention is that his invention is novel and useful, no one having previous to his patent of 1871 constructed a strong iron frame flush with the pavement and utilised the old ship's light with glass prisms so adjusted as to let in a powerful light into cellars or store-rooms. His counsel urged that it was practically admitted at the trial the plaintiff's framework, &c., was useful and novel, and the jury found that it was new to glaze pavement lights in the manner set out in the plaintiff's specification, and that the defendants' framework and prisms were a colourable imitation of it. The defendants rely on the answer given to one of the questions put to the jury—viz., whether, having regard to the state of knowledge at the date of the patent, it was a new thing to form and arrange a prism so that the light would be thrown forward in one direction by making one of the sides of the prism upright, or nearly so, and the other side inclined to it at such an angle that the light passing through the upper surface may strike the inclined side and be reflected completely, or nearly so, within the prism, and issue from the upright, or nearly upright, side in the direction required: "Is that a new thing, having regard to the state of knowledge in 1871, the date of the patent?" Answer,—"No." The plaintiff's invention, therefore, it was contended, was not novel, and it could not be the subject of a patent. Something very similar had been done by Mr. Darker, by means of a prism, before the patent of the plaintiff. The form of the frame was old and the glass flange was old, and the defendants, by cutting a nick out of a glass prism placed in a frame, had only used the knowledge common to all the world and had not infringed the plaintiff's patent. After hearing the arguments of counsel and a full citation of the authorities, their Lordships gave judgment for the plaintiff with costs, granting also the injunction and account prayed for in the claim. The matter was, however, directed to stand over for 10 days, in order that the defendants' advisers might have an opportunity of seeing whether they would come to any settlement, or whether they would go to the Court of Appeal.

DISTRICT SURVEYORS AND THEIR FEES.—On Wednesday, at the Mansion House, Messrs. Trollope and Sons, builders, were summoned before Alderman Sir Andrew Lusk, M.P., at the instance of Mr. Collins, the Board of Works district surveyor for the eastern portion of the City, for having, as builders of premises at 27 and 28, Nicholas-lane, neglected to give notice to him within two days of the commencement of the work. Mr. St. John Wontner, solicitor, attended for the defence. The summons was taken out under the provisions of the 38th section of 18 and 19 Vic., chap. 22, notice having to be given by builders within two days of the commencement of the work to the district surveyor, containing particulars, *inter alia*, of the situation, area, height, and probable uses of the building. In this case Messrs. Trollope were the builders of 27 and 28, Nicholas-lane, in the ward of Langbourn, which was claimed by Mr. Collins as being a portion of his district. Mr. Wontner stated that the firm had pulled down old and erected fresh premises on the site in question. They looked at the list of district surveyors, and gave the notice to a Mr. Power, who they thought was the surveyor, and to this gentleman the firm paid the required fees. Mr. Collins said that Mr. Power was the surveyor of the adjoining ward of Candlewick, and therefore a mistake had been made by the defendants in giving him the notice. The buildings were within the ward of Langbourn, which was a portion of his (Mr. Collins's) district. Mr. Wontner said they had given the required notice when the buildings were commenced to Mr. Power, who was thought to be the proper officer. They had inquired at the Board of Works, but had been unable to get the question decided as to the proper district. The boundary of the two wards intersected the buildings. Mr. Power had inspected the premises and certified that all was correct. The penalty was recoverable under Jervis's Act, in which it was laid down that the proceedings must be taken within six months of the commission of the offence. He, therefore, took the objection that, as the buildings were commenced in April, the proceedings should have been taken within six months of that date. He complained that his clients had been summoned there on a criminal charge simply that a decision might be given as to who was the district surveyor. The Court was not called upon to decide that, but whether his client had committed a breach of the Act of Parliament in not giving notice. Mr. Collins could recover the fees paid to Mr. Power by suing him in the County Court. The Beadle of Langbourn Ward was called to prove that the premises were in that ward wholly and solely. Mr. Collins contended that he was the surveyor of that ward. After some further arguments, the case was adjourned.

CHIPS.

The Mayor of Salisbury (Mr. E. F. Kelsey, J.P.) is about to have a residence erected on the Milford Manor Estate in that town, the architect being Mr. J. O. Parmenter, of Southampton, the contract having been taken by Mr. John Barber, builder, of Brown-street, Salisbury.

At the St. Olave's district board of works last week a report was received from the works committee recommending that the costs incurred by the board in hiring carts, horses, and drivers, and extra labour, and other expenses incurred, through the default of the contractor, Mr. Reddin, to remove the recent heavy fall of snow, be charged against him. It appeared that the board's officers applied to Mr. Reddin for more carts to clear the streets, but the contractor failed to comply with the request. It was decided to charge the cost thus occasioned, £24 16s. 6d., against the contractor, and it being reported by the inspector that 121 streets were not properly cleansed, it was further resolved that a penalty of 5s. each be enforced for each of these streets. Several members urged the desirability of the board undertaking its own scavenging.

An Odd Fellows' hall in Hanworth-road, Hounslow, was opened on Tuesday. It is Gothic in style, seats 700 persons, and has been built from the designs of Messrs. Cooper, Son, and Miller, architects, of Reading.

A new chapel for the United Free Methodists was opened in St. George's-road, Truro, on Thursday week. The style of the building is Gothic, and it has a façade of Plymouth limestone, with granite and Bath-stone dressings. 600 sittings are provided, and the cost has been £2,250. Mr. James Hicks, of Redruth, was the architect, and Mr. J. Blight, of the same town, the contractor.

The foundation-stone of a new workhouse infirmary was laid at Mile-end Old-town on Tuesday. The building will accommodate 400 patients, and the contract for erection has been taken at £32,300.

Our Office Table.

AN agitation has once more been started in the City for roofing the Royal Exchange with glass. The wonder is how City men could have patiently put up with such an inconvenience so long. The proposed glass roof needs no discussion. Not a few of these who frequent the Exchange in the afternoon are elderly men accustomed to all the comforts of modern civilisation, and why they should have to be exposed to the inclemency of the weather as though they were night policemen or sentries on guard at Buckingham Palace, it would puzzle even the members of the grand Gresham Trust to discover. Since the last occasion on which the proposed system was seriously discussed, improved systems of glass roofing have been widely adjusted, which obviate many objections raised to the older methods. With these, those who have the custody of the Royal Exchange should make themselves familiar.

THE burning of stained glass has always been a very important part of that business; numerous failures from over-heating or not sufficient heating have been a constant source of trouble to the stained-glass artist. The old kilns for burning glass have been heated by coal, and the volumes of smoke sent forth for the six or eight hours required to get the proper heat have, since the Smoke Prevention Act, obliged many of the glass stainers to burn at night or be summoned for committing a nuisance. Messrs. Thompson Bros., of Leeds, have, with the assistance of a stained-glass artist, invented a gas kiln emitting no smoke, and, they claim, so completely fusing the outlines and shading, that in some cases it is difficult to say on which side the colour has been placed. Tiles are burnt and all kinds of glass bent by the same kiln. By this process a kiln 9ft. by 4ft. can, it is stated, be filled, burnt, and emptied three times in 24 hours, given four hours to heat and four hours to cool each kiln full of glass. The coal kiln can only be heated and emptied once in twenty-four hours.

THE sister obelisk to that on the Thames Embankment, presented to the Americans by the Khedive of Egypt, was safely set on its pedestal in the Central Park, New York, on the 21st of January. Three things in connection with the American obelisk contrast strongly with three others in connection with the one brought to England. The American engineers managed its transport and re-erection without any hitch, and yet do not seem to think they have accomplished anything miraculous; the individual who paid the cost insisted on his name being kept secret—though many people believe him to be Mr. W. H. Vanderbilt, who has done a good many other handsome things in the same unostentatious way; and, finally, the Americans contrived to find a site for the obelisk without quarrelling for months as we did, and up to the present have not embellished it with imitation sphinxes or brass corner-pieces. American art, engineering, and modesty, are so immeasurably behind our own, as we know, if all the world does not, that for once we can afford to feel small.

AMONG the evils resulting from the intermittent system of water-supply, and they are too well known to require reiteration, may be mentioned the waste that is hourly and unavoidably going on, and which, to a great extent, is impossible under the constant system. Mr. Parry, for instance, in his recently-published handbook, shows this clearly by a diagram indicating the number of gallons per hour flowing into a district each hour during the intermittent supply, from which it appears that during the intermittent service the consumption was at least 50 per cent. greater than an economically-controlled constant service. The diagram illustrates no exceptional case, and the pipes and fittings of the houses were examined periodically during the time, and the leakages repaired when discovered. A more remarkable instance is that afforded by Liverpool, when the drought in the summer of 1865 led to a restriction of the supply. Although the duration of the daily service was reduced to seven hours, the diminution of the total daily consumption from the change was only 5 per cent. instead of 70 per cent. The table given shows a striking increase of waste under the intermittent system, while the rate of consumption under the constant is now 22½ gallons per head per day.

FEW of the peers who argued the question of opening museums and galleries on Sundays, this week, seem to have troubled themselves to find facts on which to base their deductions. Here is one which ought to have some weight. In England and Scotland such institutions are kept fast closed. In Ireland, on the contrary, the National Gallery of Dublin is opened from two o'clock on Sundays until dusk, or until six o'clock in summer. The number of Sunday visitors amounts on an average to nearly half the whole free admittances of the week, ranging from 600 to 1,000, while the weekly average is something over 2,000. The visitors consist almost exclusively of the working classes, and are very well behaved, two policemen being quite sufficient to keep order. Of course, Lord Shaftesbury will at once connect the opening of the National Gallery in Dublin with the lawless doings of the Land League!

Epps's Cocoa.—Grateful and Comforting.—"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*—Sold only in Packets labelled—"JAMES EPPS and Co., Homœopathic Chemists, London."—Also makers of Epps's Chocolate Essence for afternoons.

CHIPS.

A new vestry is in course of completion for the church of St. Giles, Kingston, near Canterbury, the restoration of the chancel being already completed. Mr. Robert Davies, of 30, Dorset-street, Portman-square, W., is the architect, and Messrs. Sutton and Wood, of Canterbury, are the contractors.

The town council of Newport, Mon., have adopted a report from the free library committee, recommending the adoption of the plan of Messrs. Watkins and Sons for a new free library; the cost of execution is estimated at £3,000.

Messrs. Spalding and Evans, architects, of Queen Victoria-street, E.C., have dissolved partnership.

The vacant post of inspector of factories has been conferred on Mr. Henry Prior, secretary to the Amalgamated Society of Carpenters and Joiners.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill. *Use no substitute.*—[ADVT.]

Holloway's Pills.—No amount of wealth, no means of pleasure are of the slightest value without health. It is inconceivable how small a disturbance of the animal functions begets wretchedness, and how readily it may be rectified by a few doses of some purifying and regulating medicine, such as these world-renowned Pills, which are ever the sufferer's surest friend.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Academy Lectures on Architecture, by Professor G. E. Street, R.A. No. V. "Thirteenth Century Architecture of France." 8 p.m.
Royal Institute of British Architects. "The Law of Light and Air." By T. Roger Smith. 8 p.m.

TUESDAY.—Institution of Civil Engineers. Discussion on "The Weight and Leading Dimensions of Girder Bridges." Paper on "Tide Gauge, Tidal Harmonic Analysis, and Tide Prediction." By Sir William Thomson, LL.D., F.R.SS., L. and E. 8. p.m.

ROYAL SCHOOL OF MINES.
NOTICE OF CHANGE IN PLACE OF DELIVERY.

Prof. Goodeve's Lectures on APPLIED MECHANICS will be delivered at the MUSEUM OF PRACTICAL GEOLOGY IN JERMYN STREET, commencing on next MONDAY EVENING, the 28th inst., at 8 o'clock. Tickets may still be had, by Working Men only, on application at the Museum.

F. W. RUDLER, Registrar.

ROYAL POLYTECHNIC.—Utopia, a Grand Fairy Romance. The Electrical Railway; Great Lightning Inductorium; a Lecture on Scientific Wonders, by Mr. J. L. King. Musical Sketches by Mr. Eric Lewis. Christmas and its Customs, by Mr. Frank Heath. Humorous Recitals by Madame Hickson. Blondin, Leotard, Diving Bell, &c. Admission to the whole, 1s. Open from 11 till 5, and from 6 till 10.

PERSPECTIVES and other DRAWINGS made, coloured, etched, or finished in any style on reasonable terms.—Address, W. PRINCE, Chapel-road, Sale Manchester.

PERSPECTIVES COLOURED or ETCHED.—Competition Drawings, &c., prepared by Artistic Draughtsmen in the best style. Terms moderate. Architects assisted at their offices.—EXPERT, 8, John-street, Adelphi, W.C.

TO ARCHITECTS and BUILDERS.—QUANTITIES accurately and promptly prepared, and Variations on contracts measured by an experienced Builder's Surveyor.—Mr. SARGEANT, 8, Great Queen-street, Westminster.

PERSPECTIVES in Pen and Ink, and other Drawings made at moderate charges.—J. G. BUCKLE, architect, 10, Adam street, Adelphi, W.C.

QUANTITIES.—Quantities taken out and guaranteed by a Surveyor of twenty years' experience upon most reasonable terms.—Mr. CRUTCHLOE, 3a, Poets-corner, Westminster Abbey.

THE LONDON DRAWING OFFICE, No. 98, London Wall, E.C. For the execution of high-class ARCHITECTURAL DRAUGHTSMANSHIP. Perspectives Outlined, etched, or coloured; Designs; Sets of Plans; Detail and Working Drawings, Tracings, &c., on moderate terms. Etchings for Photo lithography. Competition work. Manager, Mr. E. H. LLOYD.

TO ARCHITECTS, BUILDERS, AND OTHERS.
QUANTITIES Prepared, Buildings measured with accuracy and despatch, Estimates priced, disputed cases undertaken, by a thoroughly efficient and practical surveyor; 23 years' experience.—For terms, &c., address J. FLEW, 98, PRESTON-STREET, BRADFORD, YORKS.

TO ARCHITECTS.—TEMPORARY ASSISTANCE rendered on moderate terms; high class Perspectives coloured or etched; finished drawings from rough sketches.—Address, A. R. A., 21, King William-street, Strand, W.C.

STOCKS.—Good STOCK BRICKS for SALE, at Tanners' Hall Brickfield, Silver-st., Edmonton. Apply for prices to GEORGE CRABB, PHŒNIX WORKS, Kingsland Green, E., Or to the Manager on the Field.

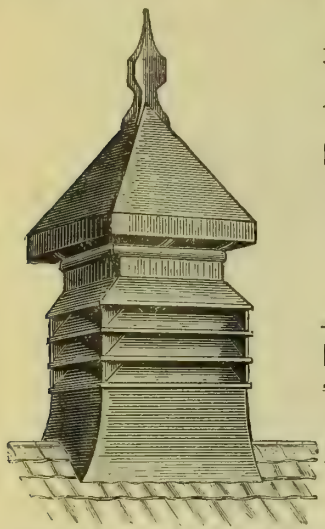
THOMAS WINN,
VICTORIA BUILDINGS, PARK LANE, LEEDS,
Entrance opposite the Yorkshire Fine Art Society's New Buildings. Practical Building Valuer, Arbitrator, and Surveyor. Disputed Accounts adjusted, Dilapidations Surveyed. Every description of work in the building line measured and valued. Arbitrations and references undertaken.

DRY WAINSCOT in every thickness at 7½d. per foot in the inch. Dry Mahogany from 6d.
Dry Yellow Deals, £16 10s. per 120.
Spruce Deals, £15 per 120, 12ft. 3in. by 9.
Dry Floor Boards, from 10s. 6d. per square,
T. FORMAN, Walnut Tree-walk, Lambeth, S.E.

BUILDER AND CONTRACTOR'S PLANT for SALE.—A nearly new 10 H.-P. PORTABLE ENGINE; a capital Second-hand Combined Engine and Mortar Mill, Murray's Chain Pump; a pair of 16in. Cylinder Winding Engines; 4 and 5 H. P. Vertical Engines.—Apply, CHARLES POWIS and CO., 60, Gracechurch-street, London.

SITES for STABLES. Portobello-road, Notting-hill.—Coach-houses, with rooms over, to LET. Good roads, pavement, and sewers. No agents.—Address: A. G., 33, Lady Somerset-road, Highgate-road, N.W.

PATENT SELF-ACTING EXHAUST VENTILATORS,



(The Invention of Mr. R. WEAVER, C.E., F.C.S., the Sanitary Surveyor,)

FOR ASSEMBLY ROOMS, CHURCHES, SCHOOLS, WORKSHOPS, STABLES, BILLIARD ROOMS, &c.

A thoroughly efficient Apparatus **at a reasonable cost**, for Extracting Vitiated Air and without mechanical motion. Also,

Ventilating Tubes, of a variety of sections and sizes, with Valves and Patent Air Filters, suitable for Apartments of every Description.

Prospectuses and Price Lists on application.

A Liberal Discount to the Trade

PATENT EXTRACTOR VENTILATOR

For 2-inch or 3-inch Pipe,

ENAMEL PAINTED,

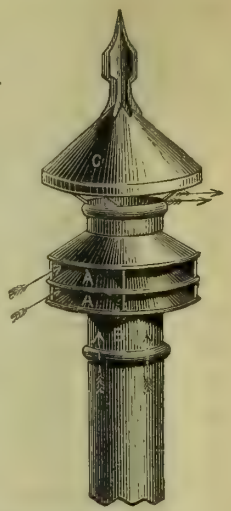
17s. 6d.

FOR SOIL PIPES.

For 4-inch Pipe,

ENAMEL PAINTED,

25s. 6d.



THE SANITARY ENGINEERING AND VENTILATION CO.,

No. 115, Victoria Street, Westminster, S.W.

CONTRACTS—*Continued.*

TO BUILDERS.

The London General Omnibus Company (Limited) are prepared to receive TENDERS for the ERECTION of STABLING, OMNIBUS SHED, and DWELLING ROOMS in Cathcart-street, Kentish Town.

Plans, specifications, and patterns of special fittings may be inspected and bills of quantities obtained at the Office of the Superintendent of Works at their Depot, Beal-lane, Spitalfields, on and after the 28th day of February, on payment of £2 2s., which will be returned on receipt of a bona fide Tender.

Tenders on the form supplied to be delivered at the Chief Office, No. 6, Finsbury-square, on THURSDAY, March 3rd, at half-past two precisely by the parties, who must attend personally.

The Directors do not bind themselves to accept the lowest or any Tender. By order,

R. T. KINGHAM, Secretary.

6, Finsbury-square, February 23rd, 1881.

TO BUILDERS and CONTRACTORS.

Persons willing to TENDER for the BUILDING NEW SICK-WARDS at the Isle of Wight Union Workhouse, are requested to forward their names to the architect, Mr. WILLIAM T. STRATTON, 31, Holyrood street, Newport, Isle of Wight, not later than on WEDNESDAY, the 2nd March next, after which date no application will be attended to.

18 February, 1881.

TO BROKEN GRANITE & PAVING STONE MERCHANTS, ROAD CONTRACTORS, CARTERS, DUST CONTRACTORS AND OTHERS.

The Vestry of the Parish of Lambeth hereby give notice that they are desirous of Contracting for the following WORKS:—

Slopping and Cleansing, Collection and Removal of Dust, Supply of Men, Horses and Carts for Watering Roads and the Carriage of Materials, Supply of Broken Granite, Flints, Gravel, and Paving Materials during the ensuing year ending 25th March, 1882.

Specifications and Particulars, together with Forms of Tender, may be obtained upon application to Mr. Hugh McIntosh, Surveyor, at the Vestry Hall, Kennington Green, any day after the 24th instant, between the hours of 12 and 2 o'clock.

Sealed Tenders, endorsed, and directed to the Vestry, and marked outside with the subject of the particular Tender, must be delivered at the Vestry Hall not later than 3 o'clock on FRIDAY, the 4th March.

The Vestry do not bind themselves to accept the lowest or any Tender, By Order,

HENRY J. SMITH, Clerk to the Vestry.

Vestry Hall, Kennington Green, February 21st, 1881

TO BUILDERS.

TENDERS are invited for the ERECTION of FARM BUILDINGS at Blanch Farm, South Mimms, near Barnet, N., for Major Naper. Drawings, specification &c., may be inspected at the office of Messrs. BROOKING and NELSON, Architects and Surveyors, High-street, Barnet, N.

Tenders to be sent to such office by March 14th next.

The lowest or any Tender not necessarily accepted.

TO BUILDERS.

TENDERS are invited for ADDITIONS AND ALTERATIONS to the "The Limes," East Barnet, for H. M. Jenkins, Esq.

Drawings, specification, &c., may be inspected at the office of Messrs. BROOKING and NELSON, Architects and Surveyors, High-street, Barnet, N.

Tenders to be sent to such office by March 10th next.

The lowest or any Tender not necessarily accepted.

TO BRICKMAKERS.

TENDERS are required for the Supply of LABOUR and MATERIALS necessary in the manufacture of Bricks upon a Building Estate near London.

For particulars, apply to Mr. D. W. ASTON, Surveyor, 1, Addison-road, Kensington, W.

METROPOLIS LOCAL MANAGEMENT ACTS.

THE BOARD OF WORKS FOR THE PLUMSTEAD DISTRICT.

TO BRICKMAKERS AND OTHERS.

The Plumstead District Board of Works are prepared to receive TENDERS for the PURCHASE of the HEAP OF FINE SIFTED CINDER ASHES now lying in a heap containing about 750 cubic yards, more or less, in a certain field upon the South side of, and in, Manor-lane, in the parish of Lee.

Printed forms of Tender, which may be obtained at the Office of the Board, are to be delivered at this Office, addressed to the Clerk of the Board, before 4 o'clock on WEDNESDAY, the 2nd day of March 1881.

The Board do not bind themselves to accept the highest or any Tender.

By Order,

GEORGE WHALE, Clerk of the Board.

Board Offices, Old Charlton.

21st February, 1881.

Now ready, 12mo, half-bound, 4s.; limp cloth, 3s. 6d. (postage 4d.)

LOCKWOOD'S BUILDER'S and CONTRACTOR'S PRICE BOOK for 1881.

With Additional Matter and Prices Revised to the present time. Edited by F. T. W. MILLER, architect. "An elaborate collection of memoranda for technical use."—*Athenæum*. "An invaluable work of reference in the every-day processes of building and contracting business."—*Builder's Weekly Reporter*.

CROSBY LOCKWOOD & CO., 7, Stationers' Hall-ct., London, E.C.

Now Ready, price 4s., Sixty-fourth Edition.

LAXTON'S BUILDERS' PRICE-Book for 1881, containing above 72,000 prices, carefully corrected and revised according to the present prices of materials and labour; together with many new, useful, and important Memoranda; and Prices and Descriptions of New Materials and Inventions suited to the Builder, Contractor, and Engineer, and all Trades connected therewith.

In this Edition will appear an entirely new Section on Sanitary Work, embodying practical suggestions relative to House Drainage, Water Supply, and Ventilation, written expressly for this work.

KELLY and CO., 51, Great Queen-street, Lincoln's-inn SIMPKIN, MARSHALL, and CO.; and all Booksellers.

EVERY ARCHITECT'S, SURVEYOR'S, AND BUILDER'S OFFICE should contain a set of

MR. BANISTER FLETCHER'S VALUABLE TEXT-BOOKS, arranged in Tabulated form, and fully indexed for ready reference.

QUANTITIES, the most complete, concise, and handy work on the subject, copiously illustrated, 3rd Edition, with additional chapters on Cubing, Priced Schedules, Forms of Fair Bills, and the Law relating to Quantities. Crown 8vo., 6s.; post-free.

DILAPIDATIONS, with Schedules of Trades, &c. 2nd Edition, crown 8vo., cloth, 5s., post-free.

LIGHT and AIR, with methods of Estimating Injuries, Reports of Most Recent Cases, &c. Twelve diagrams, crown 8vo., cloth, 6s., post-free.

COMPENSATIONS, with Appendix, giving Forms of Precedents, and Valuation Tables; crown 8vo., 3s., post-free.

ARBITRATIONS, Crown 8vo., cloth, 5s. post-free

The set of five vols., in cloth-covered box, price 28s., carriage paid.

Also,

MODEL HOUSES for the Industrial Classes, 2nd Edition, with additions; 13 plates, 8vo., cloth, 6s., post free.

N.B.—These works cannot be obtained at Mr Fletcher's Offices, but should be ordered direct from the publisher,

B. T. BATSFORD, 52, High Holborn, London, or of any Bookseller.

1881 Edition Now Ready, Enlarged and Revised.

SEWAGE DISPOSAL.

"TEN YEARS' EXPERIENCE IN INTERMITTENT FILTRATION"; a Dozen Instances with Results of Sewage Farming. By BAILEY DENTON. Price 3s. 6d.

SPON, Charing Cross, London.

COMPETITIONS.

TO ARCHITECTS, ENGINEERS, &c.

WANTED, a MODERN DESIGN for a Public WASH-HOUSE proposed to be erected at Stocksbridge, near Sheffield, (where there is a good supply of soft clean water), suitable for the use of 300 to 400 families (workmen)

Plans, with Specifications, and cost of all Machinery, Boilers, and Utensils, to be sent to SAMUEL FOX and Co. (Limited), Stocksbridge, near Sheffield

£10 will be given for the Design accepted by the Company.

SUFFOLK LUNATIC ASYLUM. TO ARCHITECTS.

PLANS and ESTIMATES are required for the ERECTION of a NEW BLOCK of BUILDINGS at the County Lunatic Asylum at Melton, in the county of Suffolk, for 150 patients.

Part culars can be obtained from Dr. Eager, Medical Superintendent, at the Asylum.

The said Plans and Estimates to be addressed to "The Chairman of the Committee, Melton Asylum, Woodbridge," not later than the 24th March next.

The Committee do not bind themselves to accept any Plan or Estimate.

CHERRY, Clerk of the Peace.

County Hall, Ipswich, 24th February, 1881.

WEST DERBY BURIAL BOARD. COMPETITIVE DESIGNS.

The West Derby Burial Board beg leave to inform the Competitors that they are taking measures to ascertain whether certain Designs that have been submitted to them can be carried out for the sums specified.

This will be a work of time, and several months will probably elapse before they will be in a position to announce their final award.

19th February, 1881.

NEW EXCHANGE STATION, LIVERPOOL.

—Reports, Specifications, Approximate Quantities, and Estimates supplied to Competitors on easy terms.—Address F., Washington Restaurant, Liverpool.

TO MASONS AND CONTRACTORS.

—To be DISPOSED OF, upon reasonable terms and with immediate possession, a Mason and Contractors' BUSINESS, situate in Clarence-street, Kingston-upon-Thames, where a good and lucrative business has been carried on for the past 50 years. Death of the proprietor being the sole cause of disposal, a lease of the premises will be given.—Apply by letter, in the first instance, to Mr. H. R. TRIGG, Clarence street, Kingston

PARTNERSHIP. — ARTISTIC METAL WORKING BUSINESS.—WANTED, an Energetic Partner with about £2,000 at his disposal, to join a Gentleman whose business has been established for 30 years in Manchester, and who is practically associated with the most eminent Architects and Contractors. The business connection is capable of very great enlargement. The incoming partner will be required chiefly to superintend the Office and Out-door Clerks' Department; the highest references can be given and will be expected.—Address, J. R. C., care of S. Beaumont, Esq., 26, Booth-street, Manchester

FOR IMMEDIATE DISPOSAL, an

Old established Monumental Stonemason's and Jobbing BUSINESS in a small town in the North of Devon; satisfactory reasons for selling.—Address, Mr. W. C. MEDLAND, Architect and Surveyor, Torrington, North Devon.

THE BUILDING NEWS.

LONDON, FRIDAY, MARCH 4, 1881.

DESIGNING IN THE SOLID.

MR. C. BRUCE ALLEN'S letter, in the BUILDING NEWS of the 4th of February, gives us the opportunity of putting together a few thoughts on the subject of which he has been the able and persevering exponent. And, first of all, it may be noted that the theory about the production of art-work with which he, and subsequently some other writers, have made us familiar, seems to consist of two parts, not necessarily inseparable. The first part is, that solid forms should be designed in the solid, and not by mere flat representations of them; the second part, if this does not belong, as an extreme view, rather to some of Mr. Allen's imitators than to himself, is that all art-work, from the largest to the smallest, ought necessarily to be designed by the very men who execute it. We think there are cases in which both parts of the theory are true, cases in which neither is true, and cases in which one only is true. In small works of the higher class, among which may be included figure-sculptures, decorative carving, and non-geometrical ornament of all sorts, perfection can only be expected when the design is first modelled instead of being drawn, and when the designer is the very man who is finally to execute it. Even here, however, as everywhere else in the world, to find the right path is not so easy as it looks; and here, as everywhere else, there is the danger that in following to its consequences one right principle, we shall forget and trample on another no less right and important. For instance: if the sculpture, or carving, or ornament is to form part of a building, as the best sort of all these things once did and still should do, it is not enough that they shall be good in themselves; it is still more important that they shall be fit for their place. Hence it may be necessary either to do without them altogether, which in these times would often be the wisest thing, or to put up with an inferior excellence in the minor detail, rather than spoil the harmony of the composition as a whole. In the ages of perfect art, the architect and the sculptor, the architect and the carver, the architect and the decorator, were alike in tastes and aims; their works naturally agreed with each other, for they all worked, all their lives long, in one and the same style. Now, on the contrary, almost every architect has or tries to have, a style of his own, and finds it hard enough to meet with subordinate artists whose work will do anything but painfully jar with it. From the most ambitious to the least ambitious of modern structures—from the Albert Memorial, where the sculpture almost makes us wish the architecture away, down to a multitude of humbler examples, where we are led to wish, conversely, that the architect had turned out the carver, this want of harmony stares us in the face. Decoration is, after all, only the sauce where architecture is the dinner; and the question is, Shall we have a well made sauce that will spoil the meat, a badly-made sauce that will agree with it, or no sauce at all? A prudent man is likely to choose the last course, as the least of the three evils; and thus the case in which both parts of Mr. Allen's theory are true becomes one in which few architects of the day are able to act on his principle.

There are cases, however, and very numerous cases, in which neither part of the theory seems to hold good. All work that consists only of geometrical forms can be worked perfectly from drawings of those forms. There is only one right way of working a given form of this class, and the right way is the same for every workman. Nothing has to be left to his taste, or judgment, or discretion: he has only to do his work in a workmanlike way, and the intended result will come of itself. That this should be so seems positively painful to some writers on the subject. They picture every workman as a born artist, brimming over with fancy, invention, and originality; and it grieves their very hearts to think of such a man passing year after year in mere mechanical work. Mechanical work, however, is just what the majority of people like: far more men are made for doing than for thinking. How many "neat men" are there to one inventive architect? One would like to ask these sympathetic writers how many born artists they meet with amongst their own acquaintance, amongst the people they go to business with, the tradesmen who supply them, the servants who wait on them, and why they think that working men, who, as we all know, are "our own flesh and blood," should be so incomparably more artistic than other men? It is no more necessary, however, that every workman should be by nature an artist than that every soldier should be by nature a strategist. Plenty of other endowments than these are needed before a successful building or a successful campaign could ever be carried out; endowments which, if less showy, are quite as indispensable, and which are wanted by men and supplied by nature, in the proportion of something like a thousand to one of the showier ones. But the curse of our time, to use language which is no stronger than it is true, is that everybody wants to be at the top of the tree, and that everybody of a benevolent disposition wants to pull everybody else up there also. It is the time in all departments, commercial, social, and artistic, and in the latter, which is the only one with which we have here to deal, is the cause of innumerable evils. We ought to adopt the highest style of architecture, people tell us, and the highest style of decoration, and they do not stop to ask whether the one will be congruous with the lowest purposes, or the other producible by the lowest type of decorators. Returning, however, to our subject, it may be said, with regard even to geometrical forms, that in old examples there is a certain life and freedom in their arrangement which is rarely found in work of our own day; and that this shows that a good deal of liberty must have been left to the workman, even here. We admit the life and freedom, but we think it less likely to be due to the workman than to the architect. An architect without a contractor, free to modify his building from day to day as he watched it growing, was a very different being from the modern contractor-ridden architect, bound to "prophesy" his whole building before a stone of it is laid, and to live in bondage all his days through fear of extras. If architects could, one and all, renounce their pretensions to the gift of prophecy, could get rid of the fetters in which contracts tie them, and could build, as their predecessors did, just as much or as little as the money in hand would admit of, we might see life and naturalness in architecture once more.

This brings us to the third case, in which we consider that one only of the principles which we understand Mr. Allen to insist on is either true or practicable. This is the case of large art production, such as entire buildings and the like, which are far too vast to be executed by one man. It is inconceivable to us that the general design, the all-pervading idea, the indivisible soul, which gives unity and almost personality to every great architectural work, could ever have been made up by the contributions of a multitude of workmen. That those workmen who were fit for it once had more liberty of design than it is possible under the conditions of to-day to give them, is what every one readily admits; but their liberty must have been in minor details, not in main lines and masses. It is no easier to believe that Lincoln or Salisbury, Laon or Coutances, was designed bit by bit amongst a hundred masons, than to believe that Hamlet was composed by a company of players, who each wrote his own part. When we speak, therefore, of renouncing pretensions to prophecy, we mean prophecy of details—prophecy of cost—not of that general pre-arrangement of line and mass, which must needs have existed in the case of every building worthy to be called architectural. But a building is a solid thing, and we agree with Mr. Allen that it ought to be designed in the solid. Elevations do not show it as it is, and perspectives, even rigidly accurate ones, only show it from a single point, whereas it will be seen from an infinity of points, far-off and near. Designs ought without doubt to be modelled first of all, rather than sketched, though geometrical drawings would be necessary in the after-stages of the work, just as they now are. This is so desirous, that models would probably be in universal use, but for two or three unfortunate circumstances. On existing systems they are tedious to make and difficult to alter and experiment on. If they show much detail (which in reality they seldom need do for the architect's purpose) they are very costly, and, worst of all, they are misleading and unattractive to clients. A showy view, with "men and women and prancing horses," would carry off a competition from the most admirably-studied model, provided no professional assessor were called in. Before we can design our buildings in the solid, and so avoid half the abortions that disfigure our streets, we must first discover a rapid, easily-altered way of sketching in model, and we must next insure that our sketch-models will be adjudicated on by men competent to understand them.

THE INSTITUTE PRIZE DRAWINGS.

THE drawings submitted in competition for the Institute prizes, are, generally speaking, up to the average of merit, though this time the Tite prize has elicited the highest talent. The Soane medallion and £50 prize, it will be remembered, was offered for the best design for a provincial county-court, a subject of sufficient practical utility to bring out the planning capacity of students, while possessing enough public character to demand, in its composition, some regard for architectural treatment. We can hardly congratulate the competitors for this prize in the result of their labours, and the Council of the Institute will not find the task of selection, we fear, a very easy or pleasant one. "Utility," placed in a conspicuous position, is a massively-treated building of Renaissance character, in brick and stone, not without points; but the end stair-turrets, carried up with conical roofs, do not add to the architectural impression. The plan is fairly contrived, though we hesitate to accept the corridor arrangement, with the circular staircases at either end, as the best planning. The entrances at each end, one for the public and the other for the judge, are convenient, and the situation of the registrar's public office, accessible from the public entrance and corridor, is also satisfactory. The county-court is on the first floor, and occupies the front part over the registrar's offices, lighted by front windows, and well approached by the staircases. Its dimensions are 40ft. by 30ft. 6in. The judge's retiring-room is over his entrance, and over the other entrance a vestibule is obtained for

the public. The bailiffs', waiting and witnesses' rooms are on the other side of corridor. The detail of this design is wanting in refinement. "Tendez la Main Droite" is an able and well-grouped Gothic design, with a good tower-entrance, and some fair detail. The public vestibule is made the principal feature in the plan, and occupies a large area in centre. A boldly-planned staircase is placed at the end near the entrance, and gives access to the court above. The registrar's room opens from the vestibule on the inner side, and the waiting-rooms, &c., are, at least, in serviceable proximity to the court. Another Gothic design "Ad Rem" is spoilt by some heavy details; the corner pinnacles to gables have a stumpy look, and rather detract from the general design, which is conceived in a foreign spirit. The court on the first floor is well approached by a flight of stairs leading from the waiting-hall below, and the registrar's offices are in good positions; but we do not like the separate building, or annex, thrown out behind for witnesses' rooms, nor the lighting of corridor, which latter is not very clear. Next to this is a gloomily-sullen Gothic design, conceived in a remarkably austere manner, and rather satirical in its unadorned nakedness. Well might the author motto it "My Deeds upon my Head"; it is certainly heavy and prison-like enough to remind the luckless debtor of the severity of the law. The design bears resemblance to some Mediæval Italian fortress in its lofty crenellated tower, and the windows are reduced to mere slits. In plan, the author shows an immense waiting-hall, the court being over it, approached by stairs at one end. One of the cleverest Classic designs is that of "Set Square." The plan and composition are both symmetrical; a central projecting feature crowned by a pediment emphasises the court, which is placed transversely, and forms the axis of the building, the judges' and solicitors', and other rooms, forming right and left wings in front. The ground-floor is nearly all vestibule and staircase and arcaded corridor, the private offices being in front, but the registrar's position is certainly out of the way. There is a Greek feeling in the detail; the composition is quiet and dignified, though the plan is hardly practical. "Quadratus," in a Classical Doric style, is also a symmetrical composition, heavy and too monumental in treatment. Here, also, the court is made the central feature, crowned by a flat-hipped roof, and having a Doric tetrastyle portico in front. A central entrance vestibule and circular-ended staircases are prominently emphasised in elevation; a good outline perspective, taken from a lofty point of sight, accompanies the drawings. "Equity" has some good drawing. It is in Italian Gothic, heavily treated, and its chief fault is a want of coherence in the composition. The author places the court at one end; the entrance and hall and corridor are not happily managed. "Hic Mihi Panis," "Try," an unfinished Gothic sketch with lofty tower; and "Celeriter," another half-finished perspective drawing, are also exhibited.

The design under motto "Forum," for Sir W. Tite's prize, leaves no choice for the committee of selection. It is undoubtedly an able contribution both in drawing and composition. The subject is the interior of an exchange, certainly one affording scope for architectural capabilities. The author shows a central hall 120ft. square, surrounded by corridors, these being separated by arcades with two orders of columns. At one end is a grand approach and staircase, the latter forming a distinct projection from the hall. A very clever sectional perspective through the hall and vestibule, shaded in India ink, is exhibited, which thoroughly explains the design. The hall is lighted partly by a domical roof, divided into nine compartments, each having a lantern, partly also by clerestory windows above the arcaded galleries. The details and sections are admirably drawn. "Huguenot" is the motto of a design of plainer character, Italian, of course. The proportions of central court are not happy, and the attic pilasters at the ends carrying the lantern beams look very weak. There is a wide arched recessed entrance. "Mens" is an elliptical vaulted hall or exchange, the arcade being adorned by the Ionic order. The plan is a long parallelogram, and the best drawing is the tinted perspective. "Honos alit Artes" is a very florid Italian design, with portico and lofty tower over entrance, the hall being lighted through a quadrangular dome or lantern, having iron ribs.

The Grissell medal this year is offered for a design for "tower and steeple." "Contendo" is the best design. It is an elaborately-drawn 15th-Century Gothic tower and spire, of good outline, with a section to a large working scale, and a cleverly-drawn view from belfry-floor, looking up, showing the "squinches." "Simplicity" is another contribution of merit; the ink sketches showing different stages of the spire and staging, &c., are creditable to its author; and "1881," is a pencil sketch of less merit and completeness. It must be remembered this prize is awarded mainly to encourage constructive knowledge and detail.

THE BURLINGTON FINE ARTS CLUB.

A COLLECTION of engravings in mezzotinto is now on view at the Gallery of the Burlington Fine Arts Club, arranged to illustrate the history of that art, from the earliest work of Von Siegen, the supposed discoverer of the art, down to the time of David Lucas. Little is definitely known of the origin of the art of mezzotinto engraving. Many writers ascribe the invention to Prince Rupert Palatine, of the Rhine, who died in 1682; the "Parentalia" speaks of Sir Christopher Wren as the originator, he having communicated it to Prince Rupert. In the introduction to the catalogue of this collection, a sketch of the history is furnished, which gives the credit of the invention to Ludwig von Siegen, to whom is ascribed the first plate scraped in mezzotint, which forms No. 1 of the collection. It is a portrait of Amelia Elizabeth, Landgravine of Hesse, and is dated 1642. Another is the Holy Family, after A. Caracci. Of Prince Rupert's work five specimens are exhibited, chiefly figure-subjects. The writer of the catalogue thinks Siegen communicated the discovery to Rupert, who was an ingenious and artistic Prince. He at least introduced the art into England after the Restoration. The Head of the Executioner (3), Magdalene in Contemplation (5), and the portrait of the Prince, are all exceedingly characteristic, and indicate the first methods of execution. The features are very expressive.

Many examples in the gallery serve to indicate the manner of working pursued by different artists. In No. 69, a portrait after Kneller, the face is the only part-finished, the coat and wig being drawn in white; the rest of the ground is dark. Henri Gascar's work, No. 21, "Duchess of Cleveland," is highly finished, but the ground rather coarse. The portrait of Samuel Butler, author of "Hudibras" (24); that of Jan Steen, in brown, 43, and George White's portrait of Jean Baptiste Monoyer (52), are all suggestive examples; the latter shows a crispness and precision of manner. This artist engraved after Lely, Kneller, and others. Of George Vertue's work there is one specimen, Portrait of William II., when young—a delicately-drawn portrait of the youthful prince. We also note No. 72, Peter van Bleeck's portrait of Rembrandt; No. 79, portrait of Lady Grammont, after Lely; No. 84, a mezzotint by Edward Fisher, in "first state," a fine brown print; a few works of John Dixon, in his forcible and deeply-toned manner; of James Watson, remarkable for their colour and gradation of features, Nos. 115, 116; of Richard Earlom, two exquisitely-finished fruit and flower pieces (120, 121); of Williams Ward (161); T. Goff Lupton (188, 189), and a few admirable mezzolints of landscape subjects by George Clint, Easling, J. M. W. Turner—also a work by John Watts, a powerful artist. The examples, with the exception of a few landscapes, are all portraits and figure compositions.

We have only glanced at a few of the more striking mezzotints in the gallery. An examination of them will convince any one of the beauty and delicacy of this mode of representation. The very manner the mezzotint is produced, the removal of the "ground" by degrees as the half-tints or the highest lights are required, this being done by the scraper, and the very few impressions that can be obtained from the copper-plate, are enough to show the value of the process in the hands of a true artist, and the great rarity of fine examples of the art. Resembling the finest India ink or sepia drawings, and having, to our minds, a degree of delicacy in light and shade and gradation unknown to other kinds of engraving, the art approaches painting, and its productions will always hold a high position.

ENGINEERING IN SOUTH AFRICA.

SOUTH AFRICA—generally so-called—consists of the Cape Colony, the Transvaal Territory, the Orange Free State (which is independent), Natal, Zululand, and many other native territories. And anyone who will take the trouble to look at a map, and think a little of what he sees, may obtain a fair idea of the extent of this vast region; but, from no book, as far as we know, can any idea be derived of what South Africa really is from an engineering point of view. In times past, hampered and kept back as it was by forces at once momentous and vast, it had but little opportunity for developing its latent resources. For years native wars have been an insuperable enemy to progress, and were in themselves sufficient (to say nothing of the anti-progressive Dutch population) to keep back any country, no matter what powers of development it possessed; but with all these troubles, and they are greater and more deep-seated than anyone at home imagines, the Cape Colony has made great strides. Since the year 1874 several thousand miles of railways have been surveyed, and several hundreds constructed, opened, and satisfactorily worked; and this is but a mere drop in the ocean compared to what must be done, and for which this colony is fully ripe. And it came to maturity in this respect almost (when compared with other countries) before its time in consequence of one great physical defect. South Africa has no navigable river. From north to south or east to west, we can't find one that can float a boat of ten tons for twenty miles; therefore all transport is done (except where there are railways) on common roads [of the worst description] by bullock-waggons, and as the great centres of trade are far up in the interior, such as the Diamond Fields, the Transvaal, &c., the annual expenditure on carriage is enormous. There is, therefore, little originality in the suggestion to construct railways whereby goods can be carried at less than one-half the rate, and in one-ninth the time.

In 1874 the Cape Government got a Bill through the Colonial Parliament, authorising an expenditure of £5,000,000 on railways, and that sum, and a good deal more, has been spent on the lines now open and in the last Session of Parliament another Bill was introduced by the Government for exten-

sions, estimated to cost £7,000,000; but they afterwards withdrew it for some party reasons, and not that any man was against the Bill, for every member of the House wanted to have a railway at his own door.

We will now give a hurried sketch of one line, from which a general idea of all the railways in South Africa can be gathered.

The "Frontier Railway," commenced in the latter part of 1874, and completed in 1880, is one hundred and fifty-four miles long, running from East London, a rising seaport (where Sir John Coode is carrying out extensive harbour-works), on the Indian Ocean, to Queenstown, a pretty little up-country place, situated in a mountain basin at a height of 3,540ft. above the sea-level. The country lying between these points is rich and fertile; but a great portion of it, was, until after the Kaffir War of 1878, in the hands of the "Gioka" tribe, ruled by the famous "Sandilli." The country, without being actually mountainous, is extremely broken by hills, running parallel to the seaboard, and at right-angles to the line. The engineering problem consequently was, to run from hill to hill, with the least possible expense, and by the best line. And to do this, the engineer was allowed to use gradients of 1 in 40, and curves of five chains radii (66'); the latter of which, we are afraid, were taken advantage of far too liberally, for, standing on the top of a hill commanding a good view, the line can be seen for miles twisted and distorted like a huge snake basking in the sun; and to give the reader some idea of its tortuous nature, we may add that the total length of line, between its terminal points, is one-third more than the actual distance as the crow flies.

As before stated, the country is fertile; nay, more, it is in some districts extremely rich and beautiful, but for the most part ill-cared for and badly cultivated; and the patches that are tilled are pretty well left to themselves. Few of the farms are fenced, and the houses, taking the whole farming community of South Africa, are poor and comfortless. It is true the climate is good, and the people live much out of doors.

We must now return to the railways. All lines in the Cape Colony, with one small exception, are laid to the narrow gauge, 3ft. 6in., with steel and iron rails, 45lb. to the yard, the former only used on steep gradients and on outside of sharp curves; but we hope before long to see this false economy abolished, and the former metal universally adopted. Up to the present all sleepers have been imported from the Baltic, viâ England, where they were creosoted—or, to be more accurate, supposed to have been; but the Government are now taking steps to make use of the timber grown in the country, of which there is abundance in parts; but we have not yet had an opportunity of judging of its suitability for this purpose.

Up to the present all railways at the Cape—except one—have been constructed under what is called the "Departmental System," that is to say, the Government (in whose hands are all railways) established a "railway department," and appointed Mr. Charles Hutton Gregory, C.M.G., &c., of London, the chief consulting engineer, and he organised professional staffs for each line sanctioned by the Colonial parliament, and sent them out to survey and construct them, in all 959 miles, which are now practically completed—and out of this total length only about 190 miles were constructed by contractors.

This "Departmental System" has not been considered, on the whole, a success, either by the Government or the public, and, I am afraid we must add, by many of the engineers employed. Its failure was due to many causes. In the first instance, as soon as the Bill was passed, the country were impatient until operations were commenced. Consequently, the works began before the surveys were anything like completed, and the final result was that the navvy, with his pick and shovel, had to do much that the assistant engineer could have accomplished with his level and theodolite. Again, we acknowledge it with regret, many of the engineers employed having had no previous experience in the actual carrying out of works, gave prices to tradesmen and navvies—well, to say the least, that were absurd. Another cause of the unpopularity of the system, and perhaps the most serious, is that it gives scope for peculation of a serious nature; but whether it has ever been taken advantage of or not, we do not profess to know. On the other hand, much of the work done under the "Department" is sound and good, and many of the engineers employed were possessed of ability and experience; but, unfortunately, their results were leavened by those who had no such qualities.

For these and other reasons the Government have (we understand) determined to construct all future lines by contract; and we consider such a determination a wise one, for we are convinced that the legitimate duties of a civil engineer do not embrace all those that fall on a contractor's agent; and as an engineer under this "Departmental System" was so placed, his position was at once dual and utterly false. If the time that many professional men are forced to give to unnecessary reports and endless red-tapeism was thoughtfully devoted to their work, we should not have to hang our heads so often in shame for the blunders made and attributed to the profession all over the world; and, unfortunately, the mistakes of an engineer differ vastly from those of a lawyer or doctor. In one case a client may lose a suit or a patient may die, but in the other a work is executed which probably becomes a lasting monument of ignorance and incompetency, not only to its designer, but too often to the profession at large.

In a future article we hope to deal with South Africa as a field for young members of the profession.

R. H. H. H.

ROYAL ACADEMY LECTURES ON ARCHITECTURE.*

THE PRINCIPLES OF THE ART.

In my last lecture I endeavoured—and, I hope, not in vain—to show you what course you ought to take in pursuing the study of architecture as a fine art. I assumed that you were all students, whether of my own branch of art or of others, and that you would all, if you really aimed at success, gladly welcome my advice, even if at times I seemed to demand very much from you in the way of imagination, of zeal, of enthusiasm, and, more than all, of industry. To-night I advance a step further in an attempt to show you what are the principles of the art to which some of you are devoting yourselves, and in which all of you are interested.

Few, I suppose, can doubt that there are true and false principles in all the arts; but that they are more capable of definition in regard to architecture than to any of the others, is certain, and this because the absolute truth or falsehood of an architectural work is capable of demonstration up to a certain point. But by *principles* you must well understand that I do not mean *rules*. These last have often been laid down, with the result that where they have been obeyed implicitly, all life has been most effectually stamped out. Such, *e.g.*, is the supposed rule of proportion of columns and their entablatures in Greek and Roman temples. This was derived from the measurement of some one example, and the establishment of that as the model for all others, so that, given the diameter of your column, the rest followed, and, in short, the rule was not one for designing a good column, but one for copying exactly a particular column. There is no pretence for believing that such rules ever affected the original architects; and the particular features to which they are applied are so different in their proportions in ancient examples, as to prove that, even in the best days, there was great latitude allowed, and that there was none of the insipidity which is the certain consequence of obedience to such arbitrary rules. If you want to know how far the framers of such rules may try to take you, a few quotations from Scamozzi's "Mirror of Architecture" will suffice. "Here," he says, "is shown how the columns follow one another, and how high every one must be." "The Doric must be twelve modules and fifty-three minutes and a-half high." "The Ionic must be thirteen modules high." "The Tuscan arch must be three modules and fifty-two minutes wide." "The impost is twenty-seven minutes high," and so on, down to every detail of the column, its capital and base, pedestal and impost. Everything "must be" of an exact and defined height, projection, or distance apart.

The principles of the art of architecture are as eternal and reasonable as the so-called "rules" are arbitrary and ephemeral. It is with the former only that we are concerned to-night. The most indisputable are those which affect construction, and they are of universal application. The construction of a building must be good if it is to be a work deserving of our respect; and by goodness we understand that it must be (i.) permanent; (ii.) exhibited rather than concealed; (iii.) natural; (iv.) suitable to its purpose and material; and (v.) it must avail itself of the latest discoveries and inventions where it is clear that they are available under or consistently with the first four conditions.

A few words only will be necessary on each of these divisions. (i.) *Construction must be permanent.* In my last lecture I told you that our respect for old architects was generally in exact proportion to their respect for themselves and their work. No architect would willingly, I suppose, build a wall that was certain to fall; but he is hardly less to blame who knowingly builds one that is sure not to last very long; who makes it too thin, builds it without sufficient foundations, or uses a bad quality or insufficient quantity of mortar or cement. And as it is certain that purely temporary building is not architecture at all, so that is most likely to be architectural which is made to last as it were for ever. Now, to be permanent, a wall must be well constructed. It must not only have good and solid foundations, but its weights must be evenly adjusted and duly provided for, and its various openings must be, as far as possible, no cause of weakness to it. But, according to the second principle, that construction should be exhibited rather than concealed, the coverings of these openings ought to be evident and obviously strong enough for their place. A lintel is a good thing to use if you can be quite sure that it is strong enough not to break in two, but it is not a good thing if it really does no work, but is relieved of all weight by a hidden lintel of iron, or by an arch concealed in the wall above it. So, also, in good work, the construction of the exterior should, as far as possible, show the arrangement of the interior, and you ought at once to know something about the positions of the floors, the shape of the roofs, and the sizes and uses of the principal rooms, merely by examining the exterior of the building. The next principle that I have laid down is that the design must always be natural, that is, proper to the place, as simple as the case allows, and not strained or eccentric in its character or detail for the mere sake of producing effect. And on this point I cannot do better than by quoting what Leon Battista Alberti has well said (book i., chap. ix.):—

"We ought not to lay out our whole study in adorning one part of our building, so as to leave the rest neglected and homely in comparison of it; but let them bear that proportion among themselves that they may appear to be an entire and perfect body, and not disjointed and unfinished members. Moreover, in the forming of these members we ought to imitate the modesty of nature. Let the members, therefore, be modestly proportioned and necessary to your uses. For all building, if you consider it well, owes its birth to necessity, was nursed by convenience, and embellished by use. Pleasure was the last thing consulted in it, which is never truly obtained by things that are immoderate. Let your building, therefore, be such that it may not want any members which it has not, and that those which it has may not in any respect deserve to be condemned. Nor would I have an edifice terminated with even continued lines void of all manner of variety. Variety is, without dispute, a very great beauty in everything when it joins and brings things together in a regular manner,—things different but proportionable to each other. For, as in music, when the

* By George Edmund Street, R.A. No. 2, delivered Thursday, Feb. 17, 1881.

bass answers the treble and the tenor agrees with both, there arises from that variety of sounds a harmonising whole; so the like happens in everything else. Of course, things must be executed according to the approved practice of men of skill; but with this caution, that when famous architects seem by their practice to have determined this or that treatment of Doric, Ionic, Composite, or Tuscan, to be the most beautiful of any, yet they do not tie us down to follow them so closely as to transcribe their very designs; but only stir us up by their instructions to produce something of our own invention, and to endeavour to acquire equal or greater praise even than they did."

The natural treatment of the general design of a building is, therefore, that which you should always aim at, providing for the requirements of the building without any violent sacrifice for the sake of mere architectural effect. But such a principle as this has, of course, its limits. There is a sort of scenic effect which is not to be obtained so easily in any other way as by elaborately symmetrical arrangements of plan and building. Few finer examples of this can be pointed to than Greenwich Hospital, where—save for the blank absence of any central object to which the rest may lead up—the effect is unquestionably stately and impressive in a very high degree. Another example of the same class is Bernini's really grand quadrupled curved colonnade leading up with a vast sweep to the front of St. Peter's at Rome. Its scale is grand, and its extent magnificent; but it overwhelms the building to which it leads, and, grand as the idea is, the effect is not perfect, solely, as at Greenwich, because the central object is not in itself worthy of such a noble approach. In the late Genoese palaces you will find good illustrations of the same sort of scenic architecture, dependent for its effect on stately arcades leading from terrace to terrace, and in many of the French and English houses of the Renaissance there are somewhat similar arrangements. One wing corresponds with another. There is a central porch, and the garden is arranged in regular terraces, with pavilions or summer-houses at proper intervals. But if you compare one of the finer buildings of this class—as, for instance, Montacute House or Barrington Court—with the design of, say, Haddon Hall or Magdalene College, Oxford, where every portion of the building tells its own story, and is differently treated accordingly, it is impossible to deny that the love of stately balance and symmetry may be satisfied at too great a cost, and that a far better artist is generally revealed in the least formal work of the two. However much one may appreciate scenic architecture, it is necessary here to be rather discouraging as to its common introduction. For a long time the student has been taught that the only possible good arrangement of a large building is one founded on this principle. It has been assumed that all buildings must have a centre and wings corresponding exactly. If the stables are built in the guise of a wing connected with the mansion by a colonnade, then some use must be found, at all risks, for a corresponding colonnade and wing on the opposite side. So, a chapel and kitchen having to balance each other, neither can be allowed to tell its true story on its face, and, in the end, the scenic effect is the one thing that seems to be thought of. This is not convenient building, and is consequently not good art, and the cases in which it can be ventured on must always be rare and exceptional in their opportunities.

The next rule is that the design should be suitable for the material which has to be used. This is a practical rule which involves the wise adjustment of the means to the end. No architect should ever quarrel with his materials as long as he can insure their being the best of their kind. His sole busines is to take care that his design is suitable to the material, and usually to that which is nearest to his hand. Where means are unlimited, or the object to be attained is one of monumental character, then it is right to go far afield at any cost to obtain the best and most magnificent material; for the first step to be taken, if a building is to be sumptuous, is that the material should be worthy of the labour that is to be expended on it. And to some extent, the material that is to be used settles the design of the work. A quarry which produces enormous blocks of granite has scant justice done to it if the architect who uses it confines himself to small blocks of stone. It leads almost naturally to the use of great monoliths, than which nothing is more impressive, though there may be no art in the mere magnificence of size. Again, a design suitable for a stone country would be wholly unfit for one in which brick alone could be used; and wherever many marbles could be obtained, the design, to be natural, must be in every respect quite unlike anything that could be built in a country where nothing but a fine and easily-worked oolite existed, or in one where the only material was a hard and untractable limestone. Natural use of his material is, indeed, one of the first aims of a good architect, and this not only in the selection of the stone to begin with, but equally in the way in which it is worked. If you use a fine marble for the face of a wall, it must be wrought very finely everywhere, and polished for the best part of the work. If, on the other hand, you use a freestone, you may confine yourself to working the elaborated architectural features, only leaving the body of the wall rough; but you must remember that if your architecture is to be good or elaborate, you must begin by working the face of the wall, so that the whole may be of one harmonious texture. The size of the stones and their jointing is equally to be thought of. As a rule, large stones are only to be used in large buildings; for the apparent scale of a wall depends much on the size of the stones that are used in it. The same is true if the available materials are brick or timber. With either of these the whole structure, every moulding and every detail of ornament, ought to be different from what they are in stone. Every material has its own capabilities, and the architect is bound to use each in its proper fashion. And here, on this point of making the best possible use of common materials, I may give you a quotation from Sir Henry Wotton, in the conclusion of which I think we may all very heartily agree:—

"It will, perchance, be said that this doctrine" [which he had been laying down] "touching the five orders were fitter for the quarries of Asia, which yielded 127 columns 60ft. high to the Ephesian Temple, than for the Spirits of England, who must be contented with more ignoble materials. To this I answer that this need not discourage us, for I have often at Venice viewed with much pleasure an ante-porch after the Greek manner, raised by Andrea Palladio upon eight columns, the basis of stone without pedestal, the shafts of meer brick 1½ft. thick, and consequently 35ft. high, than which mine eye hath never seen more stately of stone or marble."

He then describes how the bricks were made, and concludes,—"which short description I could not omit, that thereby it may appear how in truth we want rather art than stuff to satisfy our greatest fancies."

Finally, the architect must avail himself of the best as well as of the latest discoveries and inventions in construction. It cannot be right to build one day with arches everywhere throughout his work, and on the next to assume that no such convenient servant as the arch had ever been discovered. Nor is it reasonable to say, "I will use a round arch because I like it, but though I know that a pointed arch is more convenient, and, in some positions, far stronger, I dislike it so much that nothing shall persuade me ever to adopt it,"—a sentiment expressed with the honest frankness of his time by the old writer just quoted, in the following passage:—

"As for those arches which our artisans call of the third and fourth point, I say these, both for the natural imbecility of the sharp angle itself, and likewise for their very uncomeliness, ought to be exiled from judicious eyes, and left to their first inventors, the Goths or Lumbards, amongst other reliques of that barbarous age."

The Pompeian architect who carried the entablature above his columns on a concealed log of timber was trying to imitate the work of men who had been dealing with blocks of stone large enough to bridge the space from column to column, and there was laudible ingenuity in the Pompeian's device, who, having no stone to use, invented a substitute for it. But to us who know that such a substitute is not permanent in its nature, and that there is now a mode of carrying the wall above by arches over such spaces which may be absolutely permanent, there is no justification whatever for the limitation of the Pompeian mode of building.

In modern buildings the greater part of the construction is concealed, and there is a consequent temptation,—only too often acquiesced in,—to make it subservient entirely to supposed convenience. A common instance of this is the free use of iron as a concealed support in place of masonry. Our forefathers knew nothing of such aids to easy planning. When they made the plan of one floor they involved themselves in accepting the same plan for the floors above and below. Walls came above walls, and no little skill was required, therefore, so to plan the various floors as to make all the arrangements convenient, and yet subject to good and sound structural conditions. In our own time the temptation to carry walls on iron girders over voids is too often accepted as a matter of course; the ingenuity exercised in planning is diminished, and the structure is less permanent, for a flaw in the iron, its decay, or the accident of a fire, may involve the ruin of a whole building where, under the old conditions, the walls might have stood unharmed by such catastrophes. I do not, therefore recognise such aids to construction as these as being real and genuine. They are rather temptations than anything else, and ought only to be adopted when it is clear that their use is not opposed to the principles already laid down. The architect who attempts by concealed construction to imitate a wholly different sort of work must inevitably fail, for sincerity is of the essence of good art, and the detection of insincerity is certain. Even untutored men will surely perceive that a deception has been practised, and will resent it. If you have such magnificent material that you can obtain it in masses of sufficient bulk, I can conceive no reason for objecting to the employment of trabeated systems of architecture. The vast bulk of the horizontal block or lintel is in itself impressive; and if it rests upon blocks of corresponding magnificence, in the shape of monolithic columns, there are few modes by which the imagination can be more surely excited. But the same sort of design executed with small stones, or with bricks covered with plaster, never impresses us in the same way, because the slightest attention discloses the fact that some unseen mode of holding the work together has been adopted, without which the whole must certainly at once collapse. The Mediæval architect was, like the Greek, a frank and sincere constructor. There was no disguise about his work. In his hands each stone may be said to have had its office and to have performed its duty. And there are few examples more illustrative of his feeling than those monuments and open porches which are so common a feature in Italian buildings. Here there are four arches carried on four single shafts,—a sort of construction which is really impossible. The architect frankly announces the fact that it is so by the exhibition of an iron tie across the base of the arch which ties the whole together, and makes the whole work, not only possible, but secure. The modern mode of doing the same thing would be to continue the columns up above the caps to support concealed girders. In this way the evidence of the tie is got rid of, and the eye is distracted by a feat of construction which, to those who are not in the secret, is wholly incomprehensible. In good work the external form is always a translation of the internal structure; a building, if it is perfect, being as complete an organism as the human frame.

So far, I think you will see that the principles which are necessary in all good architecture are almost beyond dispute. It may be said by some of you that they are mere truisms. Would that they were always so accepted and acted on! It is not too much to say that if they were absolutely accepted and always acted on little more would need to be taught. The man who never consented to break one of them would, depend upon it, have so much character as to make it certain that the ornaments of his construction, which convert building into architecture, would at least have that great force which comes from simplicity and fitness for their place and work. His ornament would be that of the construction, and would not be merely applied in front of it and without reference to it. His work would be so complete in itself and in its details that even as a ruin it would be beautiful. The ruins of the consummate works of the Greek architects are hardly less beautiful in their decay than they were in their perfection. Two thousand years of neglect have left the Temple of Neptune at Pæstum as grand and dignified, as well nigh as beautiful, as on the day of its completion, whilst the Gothic ruin is equally worth studying, and just as provocative of admiration as the Greek. Every part of its construction was useful as well as ornamental, and the destruction or decay of parts still leaves what remains instinct with power and beauty. How different may the case be! In a Roman building you may too often remove the whole *appliqué* face of the architecture, and the building will still stand, but in such a guise as to give you no sense of permanent beauty; whilst in a modern building it is sufficient to let it fall into decay to see how

loathsome it has been from the first, for that "calm decay" which seems to give so many added charms to the Greek or Gothic fragment, discloses in it nothing whatever that is good, or pleasant to the eye, or in any sense venerable.

We have next to consider how far, out of the vast array of facts which the student finds in the history of his art, some may be selected which involve the establishment of abstract truths. And to accomplish this we must examine the works of all times rather than of one period only, confident of this, that as all good developments in art have proceeded from the realisation of good principles dormant before, so the more these practices are traced home to the causes or theories out of which they rose, the more likely are we to perceive their true bearing.

The first essential of a building is, as we have seen, that it shall be well built. This is not architecture. Architecture is the art of giving "style" to building, and, after this, some or all of the other abstract qualities of Rhythm, Breadth, Scale, Light and Shade, Mystery, Repose. What, you may ask, is "Style"? I will answer you in the words of one of the most distinguished of my brethren (M. Viollet-le-Duc):—

"Style resides in distinction of form, and is one of the elements of beauty, though it does not itself constitute beauty. Our sense of style is instinctive. In the midst of an assembly you distinguish one man among all others. It is not beauty which attracts you in him, and yet, moved by a mysterious influence, your eyes follow him. If you have any power of observation, you find yourself arriving at some sort of explanation of the power he exercises. It is something in his frame, as well as in his contour, in his movements and the *rapport* which exists between them and his features and expressions. By degrees you have fixed ideas as to his habits, his tastes, his character. It is the first time you have ever seen him, and you know him not; but you build upon what you see a whole romance. It is only those who possess style who exercise this singular fascination. Mankind is so spoilt by false education, by infirmities, moral and physical, that it is not common to find any who really have this quality. But look at animals, and you will find that they all possess it. There is never a false gesture, never a movement which does not follow on a want, a desire, or a fear. Animals are never affected, mannered, vulgar. Whether plain or handsome, they have style, because they have none but simple sentiments, and seek their ends by the simplest and most direct means. Man, and above all, the most civilised man, being a very complicated animal, transformed by an education which teaches him to fight against his instincts, it is almost necessary for him to get out of himself, so to speak, in order to find 'style.'"

Style in architecture is the perfect harmony between the means and the end, which is found in all the ideas and desires of the highest type of man. Refinement of detail is indispensable; largeness and breadth are its natural forms of expression; but in certain places it may give greater grace to the most intricate and delicate work. It is this noble quality which is essential in good art, and it is as possible to have it in a building as in a man or a beast. The essential condition, you see, is that your style should be a true and sensible expression of simple and abstract principles or requirements. It has nothing whatever to do with styles of architecture, as we call them, for it is possible that every one of these in succession may afford examples of incontestable style. This, at least, is clear, I suppose, to all of you,—that a vast chasm exists between architectural designs; that some are vulgar, affected, mannered; whilst others are natural, simple, and dignified; and that whilst the only admiration ever extorted for the former is that ignorant love of a new thing which is so evanescent and so little to be respected, the admiration of the latter increases as they grow older, and year by year becomes more certain and universal. The popular voice, which finds something worth loving after an age has passed since the construction of a building, is as unerring in the correctness of its judgment as the supposed approval of a new work is fallible and to be mistrusted.

The next quality at which we must aim is, like the former, one which is common to our own and other arts. The poet cannot afford to neglect style in his work any more than he can venture to trifle with its rhythm, and a perfect building has its rhythm as well as its style. It is a quality very difficult to describe in words, but in architecture it is an art depending on numbers and proportions. Some expression caught up, repeated, balanced, emphasised in succeeding passages, at intervals which are either regular or regulated, constitutes usually the rhythmical beauty of a work of architecture. No doubt it is sometimes secured by direct appliances of geometrical figures, at others by that instinct for the beautiful which makes a trained eye go so near to the figures or proportions which might be drawn by rule, but to which the charm is added of something which is fresh, human, and suggestive in its very departure from exactness. Take the simplest case conceivable, that of a Greek portico. Arrange the columns with perfect regularity and without any thought, and there is no rhythm; but arrange them so that a dominant point in the base shall be placed in a certain relation to another, as, *e.g.*, the centre in one of the columns or capitals, or in the pediment, and that the line which connects these two points be one which, if repeated again, connects other marked features, and you at once have a simple and admirable sort of rhythm. Or, take another case, to prove the point by a negative. Design a tower, 300ft. in height, and divide it into twelve equal stages, and you will have an erection which will have no more rhythm than the empty sheet has before the poet has covered it with his rhythmical lines. Yet such a tower may possess all the qualities which I have up to this point included in the conditions precedent of a good piece of architecture. It may be solid, simple, suitable for its purpose, and may even have a certain style; but not having rhythm, it is not architecture at all in any good sense. If we wish to see how the opposite effect may be produced, let us see how Giotto planned the proportions of his tower or campanile at Florence. My drawing shows you this design in elevation. You will perceive that it is divided into seven principal stages in height. Of these the six lower are grouped in pairs, and so arranged by lines of dark marble and string-courses as to increase in height as they leave the ground. In the two lower stages, the panels, being very near the eye, are of the same height. In the next coupled stages the upper windows are one-seventh larger than those below them; the fifth and sixth stages are nearly equal, but the upper one has panels marked with an outline of serpentine one-tenth longer than those below. Finally, the single story of the upper stage is equal to two of those below, and crowns with rare grace this succession of coupled stages which have gradually led up to it. The diameter of the tower is the dimension which appears to regulate the whole scheme, being one-sixth of the whole height. The gables over the windows are of the angle whose base is as 3 to a perpendicular of 4 and hypothenuse of 5,—according to the ancients the perfect triangle, the square of the hypothenuse being equal to the united squares of the two sides. But the square or circle seems to have been the figure mainly used by Giotto in arranging the lines of his work. In Giotto's tower I have given you an example which shows, I think, how conscious one of the greatest artists was of the use of some definite system of proportion. It is not possible to give you an incidental treatise on so large a subject, in the midst of a lecture which has to embrace so much in so short a time. But in a few words I may direct your attention to it, with a view to inducing you to follow the subject up for yourselves as you have the opportunity. I will take one only out of many figures which have been made much of in old times, and this is the equilateral triangle. There can, I think, be but little doubt that the proportions of the Pyramids were decided by it. Take four equilateral triangles and incline them to each other to a common centre, and you have, as nearly as may be, the outline of the finest among them. The equilateral triangle has always been one of the most favourite forms, but especially was it so in the Middle Ages. Westminster Abbey and Stone Church are both designed with its aid, and M. Viollet-le-Duc has given several French examples—Notre Dame, Chalons, if I remember rightly, among others. Old writers frequently enlarge on the virtues of this and other such figures to the architect, and though in the use of many of them there seems to be something rather empirical, it is not possible to doubt that they have influenced architects in almost all ages.

(*To be continued.*)

ART-WORKMEN—PAST AND PRESENT.*

By John Roddis.

PROBABLY, no broader example could be given of that tendency to "think in crowds," described by Mill, than the popular favour shown to picture painting and the singular neglect of the industrial arts in England during the last hundred and fifty years. This tendency has been so marked, and its results have been of such a very decided character, that it would not be too much to say that for every score of Englishmen who could intelligently criticise the points of a good picture to-day, not more than one of the number could be found capable of judging the real merits of a good piece of enamelling, carving, gem-setting, metal-working, or any similar art. Every man of average ability is now expected to know something about "art," and following the prevailing fashion the crowds have looked at pictures, until a belief has obtained that this particular branch of art-work covers the whole ground. Now, if we look at this fairly, we shall find that it is a very remarkable thing, and wholly unlike anything which has preceded it. At the beginning of the eighteenth century the art-workmen of England stood in the very first rank. The true artistic instinct in the people had survived the long gloom of Puritanism. The French taste imported at the Restoration made no lasting impression. A little repose after the storm of civil war was all that was needed to prove that the arts of England were still alive, not only at the root but in every branch and fibre. If Esmond—with those calm thoughtful eyes Thackeray loved to dwell upon—had wished to show one of his old companions from the Low Countries the artistic skill of Englishmen, do you think he would have felt that everything worth seeing could be found in the studios of the painters? No! Esmond would have known, perhaps, where some excellent artist in iron was fashioning iron bars into fairy shapes, for the park-gates of "one Squire Western." And we may imagine Thackeray's hero whispering to his friend, "Western is a wild fellow, but, like most of our country gentlemen, he knows a bit of true art when he sees it." Then he would have carried him to the shop of some artist in silver; and, having looked in upon the furniture makers and jewellers, he might have asked his companion, with all modesty, whether English art, in its widest sense, was not fairly up with the age.

But a fresh change from this wholesome state of things was to follow—and it came about in this way. Hogarth was a personal friend of Captain Coram, founder of the Foundling Hospital, and the great painter's name consequently appeared in the list of its earliest governors. Hogarth then painted a portrait of the venerable Captain and presented it to the Institution, following up the gift with the "March to Finchley," and other works. Then came Richard Wilson, Allan Ramsay, and many others, with specimens of their art, until there was hardly a painter of note in the country who was not represented at "The Foundling." A visit to this collection of pictures became the fashionable morning lounge, and the grounds of the Hospital were daily promenaded by "ladies and gentlemen of quality," in all the pride of brocaded silk, three-corner hats, gold-headed sticks, and curly wigs. This enthusiasm suggested to the minds of the shrewd painters "a long-felt want," and, in order to meet that want, they decided to hold an annual exhibition of works by "the united artists," which, under the patronage of George III., became a Royal Academy of Arts. It was a strangely slender beginning, but the want they discovered has been so well met that to-day the capital of the Academy is more than half-a-million sterling. With the rise of the Royal Academy the decline of English art-workmanship set in. That institution has given such a vastly preponderating advantage to the producers of pictures over every other branch of art-workers, and its example has been so persistently followed by the provincial art societies, that all other arts have withered for lack of light and nourishment. For more than a hundred years Architecture suffered from this neglect, and its fortunes fell so low that it was driven to feed upon the dry bones of the "five orders." I need not remind you how strong men at length began to protest against the shameful state of their profession; and, though repelled time after time by the lofty superiority of the Academicians, the good fight was carried on bravely, until English architects had shown that they could build better edifices than many of their haughty rivals could even draw. Then the Academy, after long reflection, allowed that Architecture was an art, and elected a member of the profession to their body.

* A paper read before the Birmingham Architectural Association (see p. 189).

Having called your attention to these preliminary matters I will now proceed to examine the position art-workmen have held in former times; how they have worked, and under what conditions their various arts have flourished, commencing with some of those who assisted in the great revival of art in Italy. It appears to have been the rule at that time that a master should work with a few pupils under him—an average of half-a-dozen pupils, or workmen, to one master—and when the work was very large several masters were engaged upon it. To us who are familiar with "Art Companies, Limited," employing hundreds of workmen, under the direction of men who could not fashion a bit of gold, silver, glass, iron, or clay into any artistic shape whatever, this may at first sight seem very strange; but, as we look in upon the old artists in the midst of their work, we shall probably lean with a kindly preference towards their system of working. As an architectural sculptor, I shall, perhaps, be pardoned, if I first introduce to your notice one of my own profession. The name of Nicolo Pisano rises above all the bright names of the Revival like the morning star—he it was, who, finding the art of sculpture mummified, bound in Byzantine cerements, touched the dead thing with his miraculous fingers and gave it life. Little is known of earlier days beyond the fact he worked with his father as a stone-mason. The first time we are introduced to him as a sculptor he is working upon the scaffolds at Lucca Cathedral (1233), carving the pediment over the north portal,—a "Descent from the Cross," full of bold vigour in the composition, and full of error in its details no doubt, but still such a work as had not been cut in Italy for nearly a thousand years. Nearly thirty years after that (1260), he is carving the famous pulpit at Pisa in an entirely new style. He has been ranging up and down Italy during these years, working here and there, but mostly where he could find examples of antique art for study. It is my object to-ninht to describe not works but workmen, or a great deal could be said about the pulpit at Pisa. The fame of this work brought him a commission from the city of Sienna. The Siennese, emulous of the fortunate Pisans, would have a pulpit in their cathedral still more splendid. This is the work duplicated in plaster at South Kensington —the work that would have been duplicated for every great town in England years ago, only that gilt frames obscured the vision of those who should have done it. Pisano signed the contract for the Sienna pulpit on the 29th of September, 1266, and the bond states that "Nicola with his men, Arnolfo and Lapo, and, if he desires it, his son, Giovanni, shall come to Sienna in the beginning of March in the following year in order to prepare a pulpit for the Cathedral. The master is to receive eight soldi a day, each of his assistants six, and his son four. The master shall be allowed to travel four times every year to Pisa for fourteen days in order to superintend some works in the baptistery there. The columns, and lions upon which they rest, as well as the Carrara marble for the whole of the work, shall be furnished to him." The receipts for payment are still extant, and end in November, 1268, showing that the work was finished in a year and a half. And the four men must have worked like beavers to have done it in the time. The truth is the four, six, or eight soldi a day had very little to do with that speed. The men were in earnest, and gathered delight in their work just as the labouring bees gather honey in the roses. To them a dilatory day would have been a day of wretchedness. It is a curious fact, as showing what demand there was the services of Pisano, that we find him, in 1273, entering into a bond of £300 that he would carve an altar for the Cathedral, Pistoga. A few months later the work appears to have been in hand, as we find his receipt for £100 in part payment. Of the men he took with him to Sienna, Arnolfo rose to the greatest eminence, and in his turn made a distinct mark upon Italian art. Leaving his old master, he went to Naples and entered the service of King Charles of Anjou, and afterwards worked in Rome both as sculptor and architect, in which latter capacity he was intrusted with the restoration of the Cathedral at Florence and many other important works. It is pleasant to that his good master, Pisano, remained long to follow the art that seemed to be as life to him, for in 1288, nearly fifty years after we first saw him at Lucca, he, with his son Giovanni, is carving the great fountain in the market-place at Perugia; the son greatly improved, but without the fire and vigour of his father.

I regret that in the hour at our disposal I can do little more than glance at lives of the great art-workmen. I propose to bring under your notice this evening, and having briefly looked at the system under which the carvers were working at the end of the thirteenth century, I will now call your attention to the goldsmiths, and for this purpose, I think, we shall not do better than select Benvenuto Cellini. Cellini tells us that he considers himself to be one of the most wonderful men in the world, and he insists that there must be no mistake about that. He tells us also that he was born "precisely the night of All Saints' Day, in the year 1500, at half-an-hour past four," so that we are expected not to make any mistake about that matter either. His father, he informs us, was in great anxiety as to the sex of the child, and when told that it was a boy, he could do nothing in the fulness of his heart but clasp his hands and cry "He is welcome! he is welcome!" and Benvenuto being the Italian for welcome, it was decided to call the child Benvenuto, or Welcome Cellini. Well, he claims to be a wonderful man, and he was so. By turns he was gentle-hearted as a lamb, or cruel and furious as a wolf. He rode all the way from Paris to Florence to assist his sister's children when they were in distress; and at different times he killed no less than three men in private quarrels, besides maiming many others. One day he could reason with a prescience centuries in advance of his time, and the next become a prey to superstitions that would have disgraced the meanest intellect in Central Africa. He made for the Grand Duchess of Tuscany the most delicate gem ring that ever graced the hand of a lady; and for the Grand Duke he formed the gigantic bronze statue of Perseus. He partly fortified Florence, and acted as chief gunner in Rome during the siege, killing the Duke of Bourbon and wounding the Prince of Orange. Therefore, all things considered, I think you will agree with me that we may fairly laugh at his charming self-conceit, and still believe him when he tells us that he is really a wonderful man. It was necessary I should mention these singular contrarieties in his character, or, otherwise, we should hardly be able to account for the infinite variety in his works. These would require a separate lecture, or indeed a course of lectures, in themselves, and our object to-night is to look at the man in his "shop," as he was pleased to call the place he worked in. In his memoirs he says: "Having attained the age of fifteen, I engaged myself against my father's inclinations [his father wished him be a musician] with a goldsmith named Antonio de Sandro, who was commonly called Marcone. This was an excellent artist, and a very worthy man, high-spirited, and generous in every respect. So great was my inclination to improve, that in a few months I rivalled the most skilful journeyman in the business, and began to reap some fruits from my labours." But while yet a boy his fiery temper brought him into a violent brawl, and the Council of Eight banished him from Florence. After a time we find him working for the Bishop of Salamanca, who had employed him to make a large silver vase. Cellini tells us that his only assistant at that time was a little boy. This work led up to an introduction to the Pope and further commissions. And the young man, though now but twenty-three, was not content with fame as a goldsmith; he could not feel content with that alone, but would be master of all kindred arts too. He says: "There was at this time in Rome a native of Perugia, of great abilities, named Lantizio, the only man that worked in his branch of the business, which was that of a seal-engraver. Every cardinal in Rome has a seal upon which his title is engraved; it is made as large as the hand of a child ten years old, and the title is embellished with a number of figures. One of these seals well executed costs a hundred crowns and upwards. I could not help desiring to rival so eminent an artist, though this business differs widely from that of the jeweller and goldsmith. I therefore set about learning this business, and, though I found it extremely difficult, was never wearied by any labour it cost me, but steadily pursued the objects of gain and improvement. There was likewise in Rome another eminent artist, a native of Milan, who went by the name of Caradosso. This man worked only in medals, engraved with a chisel, upon thin plates of metal and many other materials; he made some Scripture pieces in mezzo-rilievo, and figures of Christ, a palm long, of thin plates of gold, and of such admirable workmanship, that I looked upon him as one of the greatest masters of this art I had ever known; and I envied him more than any of the rest." That admiration of the master, that grand spirit of emulation led Cellini later on to excel in this department of art also, and Pope Clement eventually made him chief medallist to the Roman Mint. When he was in his twenty-ninth year, he says he "opened a fine shop in the place called Banchi," in Rome. "I kept five able journeymen, and besides the Pope's business did several other jobs, insomuch, that the shop contained different wares in jewels, gold and silver to a very considerable amount." Now, it so happened, that thieves broke into this shop, from which circumstance we learn that the five assistants lived upon the premises with Cellini, who thus formed a little art community of his own. This appears to have been a very general system, and fifteen years later, when Cellini was employed at the French Court by Francis I., we find his leading men still domiciled with him. Indeed, he describes his domestic affairs in France at some length, and we may, perhaps, take so much from the description as serves to illustrate our theme. Writing of his assistants at that time, he says: "The first and highest in my favour was Ascanio, born in the kingdom of Naples at a place called Tagliacozzo; the second was Paolo, a Roman, a person of mean birth, who did not so much as know his own father; these two I had brought from Rome, where they had lived with me. The third was likewise a Roman, who came from Italy on purpose to enter into my service; his name also was Paolo, and he was the son of a poor Roman gentleman of the Maccherani family. This young man had made but little proficiency in the business, but he was brave, and an excellent swordsman. The fourth journeyman was a native of Ferrard, whose name was Bartolemeo Chioccia. The fifth was a Florentine, named Paolo Micceri." He is also good enough to give us a view of them all at work. The king having given Cellini an old castle for a workshop, resolved to pay him a visit, and we will let the master describe the circumstance in his own words. "As the king entered the saloon, the first object he perceived was myself with a large piece of plate in my hands, which I had not yet placed, and which was to make the body of Jupiter; another was employed on the head, another again upon the legs, so that the shop resounded with the beating of hammers. Whilst I was at work, as I had a little French boy in the shop, who had some way or other offended me, I gave him a kick which drove him above four cubits towards the door, so when the king entered the boy fell against him. The good monarch laughed heartily, but I was in the utmost confusion." It was shortly after this that Cellini made for the French king the famous salt-cellar, which is without doubt one of the finest examples of the goldsmith's art ever produced by any age or nation. This work was executed in fine embossed gold, enriched with a slight charging of enamel. Round the base are figures in relief representing the four winds and the hours of the day. The upper part represents the surface of the sea, and rising from it are figures of Neptune and Cytele; both figures inclining a little backward in order to form convenient handles. The sea god rests his hand upon the prow of a ship containing salt—a tribute from his kingdom; and the goddess in like manner rests her hand upon a vase containing spice—a tribute from the earth. This masterpiece of the art is at present in the Ambraser gallery at Vienna.

We will now turn our attention to another branch of metal-work, and in order to illustrate it, we will take up an art-workman much less romantic than Cellini, but certainly not less in earnest; I mean Peter Vischer, the great bronze-master of Nuremberg. Vischer came of a family of clever braziers. It is recorded that his father, Herman Vischer, in 1457 cast the bronze font for the parish-church at Wittenberg. But there is nothing very striking about the performance. People were running pretty much together in an old groove in Germany just then, so far as bronze work was concerned. The figures modelled by Herman were of a certain "regulation" type; but still they were equal in merit to any other production of the kind at that time. At length Peter entered his father's foundry, and taking his soul in with him, presently infused such life

into the art as spread their fame far and wide. In 1489 the young man was admitted as a "master" of his art, and in 1494 he was summoned with the carver, Simon Lamberger, to the court of the Elector Philip, then residing at Heidelberg, in order to "assist him with his advice and skill." Peter was a constant and enthusiastic worker, and later on in life it was his pride to see his five sons working in the foundry with him. Still happier was he on that day when his favourite son and namesake, Peter, was admitted to—What? To the Church? To the Bar? To the College of Surgeons?—those modern schools of hunger into which the sons of successful workers crowd so eagerly?—No. Peter had what was to him a greater satisfaction than all these, for he saw his worthy son admitted a "master" in the thimble trade. But then we must remember that he *was* a "master," not in the sense that he sat up in an office with his trade books around him, while in the factory below a thousand dies were stamping one everlasting pattern of thimble from year end to year end. The rims of his thimbles were adorned with charming figures and devices, and pretty legends in praise of industry. They were works of art, and therefore he was honoured with the dignity of mastership. In one sense Peter Vischer resembled Pisano, inasmuch as he grew stronger in his craft every day he lived. From the time he entered old Herman's foundry, as a boy, life with him was one steady succession of struggles, and one unbroken run of victories in his art, until he finally subdued the stubborn nature of bronze and gave to the world his famous shrine of St. Sibald. It is generally allowed that but one other production in this material can stand in the same high rank as this shrine, and that is the work of Ghiberti in his beautiful gates. There are duplicates of both at South Kensington, but the general public merely gaze upon them with a vacant eye, seeing little or nothing of their true beauty, for their minds have received no true art-education yet, and Uncle Toby looking into the widow's eye will serve their turn much better than anything Vischer or Ghiberti could do. There is just one other point I would like to mention about Vischer before I pass on, and that is his singularly unselfish method of business. His castings were acknowledged to be the very finest in Europe. He had no rival, and few came within reasonable distance of rivalship. Yet he was always ready to throw open his foundry and place all the masterly appliances he had invented at the service of others. I think you will agree with me that this was the action of a man who earnestly sought the advancement of his art before any other gain whatever.

I will now ask you to turn your attention to the enamellers, and with them we will carry our subject into England. Enamelling is one of the few arts we do not inherit from Greece, or any other ancient nation. In a crude manner it was practised in different parts of Europe soon after the fall of the Roman Empire. Perhaps one of the most striking examples of its use may be found in the well known crown of Charlemagne, the process used being that so well described by the monk Theophilus. But we have to do with the later schools, for it was an art that grew, and almost every century added something to its worth, until the gathered skill of the ages appears to have centred in the 16th century at Limoges. That generous patron of the arts Francis I., the friend, as we have seen, of Cellini, understood art-work too well to neglect any branch of it; and having seen specimens of work by Léonard, he at once decided to found a school of enamelling at Limoges, over which that excellent workman should act as director. But—and mark the delicate care of the good king—at that time Leonardo-da-Vinci, self-exiled from Italy, by sheer envy of his mighty rival Michael Angelo, was eating his great heart away at the court of the French King; so lest the proud and sensitive Italian should think his great name might be confused with that other Léonard, enameller of Limoges, Francis ordered that the latter should be known and spoken of as "Léonard Limousin," and by that name he is recognised in the annal of artwork-manship. Limousin, like his royal patron, was fully alive to the superiority of Italian drawing and colour, and under this influence improved his school until it was in advance of anything of the kind in Europe, or, so far as we know, in the world. His portraits too were held in great repute; notably those of the Duke de Guise, and Catherine de Medici—the latter is still preserved in the Cluny Museum. But it transpired later on that even Limousin, though he had then been working forty years, had not done all that could be done with enamel. In 1632 Jean Tontin, who was very skilful in treating translucid enamels, discovered a set of vitrifiable colours, colours that would stand the fire without any change of tints. It was now no longer needful, in order to produce shadows, to use the black enamel paste employed at Limoges, and Tontin rapidly took the lead in his art. He afterwards became famous as a miniature painter, and joining with Isaac Gribeling, a painter in crayons, took pupils, among others Morliere who afterwards enamelled rings and watches so beautifully that they became the fashion. But perhaps the brightest man of that school was Petitot, a native of Geneva, who, together with Bordier, went into Italy to study in the Italian schools and laboratories. In this partnership Petitot painted the figures and Bordier the hair, drapery and backgrounds. Their joint-work attracted great attention, and Charles I. invited them to England, where they remained many years. But troubles overcast the court of Charles, the civil war broke out, and after the death of their patron they returned to France, where Louis XIV. received them with great honour. Bordier died in 1690, and Petitot survived him but one year.

(To be continued.)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.*

At the ninth ordinary (business) meeting of the Session, held on Monday, 28th February, Mr. J. Whichcord, F.S.A., President, in the chair, the President announced, with reference to the award of the Royal Gold Medal, that no substituted nomination had been sent in for the nomination made by the Council; and that, pursuant to the terms of By-law LXXVI., the vote of the Fellows present at the Special General Meeting, to be held Monday fortnight, would be taken by the show of hands on the name proposed by the Council.

A letter, addressed to the Secretary, was read from the Science and Art Department, London, S.W., transmitting, for the information of the Council, the copy of an English abstract of the principal regulations for the proposed Exhibition of Fine Arts at Madrid, which has been furnished to the Foreign office by the Spanish Minister.

All information which may be desired by intending exhibitors can be obtained at the office of the Spanish Legation, 12, Queen's-gate Place, S.W., between the hours of 2 and 4 p.m.

Mr. T. Roger Smith, Fellow, brought forward the question of the pressure of the existing Law of Light and Air upon architectural practitioners, and offered suggestions as to the rendering the law less oppressive; also as to the part which the Royal Institute of British Architects might take in forming public opinion, and promoting legislation on the subject.

Mr. Roger Smith concluded by moving the following resolution, which was seconded by Mr. E. C. Robins, namely:—"That the Council be requested to appoint a Committee of Members of the Institute to inquire into the question of the law of light and air, as it affects buildings, and to make such practical suggestions with respect thereto as may seem expedient."

A discussion followed, in which Prof. Kerr, Fellow; Messrs. C. Locock Webb, Q.C., Hon. Associate; T. Chatfeild Clarke, Fellow; H. Dawson, Fellow; Arthur Cates, Member of Council; E. S. Roscoe, Hon. Associate, and the President took part. The resolution was carried.

RENAISSANCE IN THE CITY.

Several new buildings in the Renaissance style are being erected or have recently been finished in the City. These works indicate a rather more English interpretation of a school of design which had begun to fall into disrepute some years ago, when every building of Classic architecture was more or less a copy of an Italian palace. In the new buildings we are referring to, there is a marked avoidance of commonplace columnar ordinances and details; thus in the new stone façade of the London and Lancashire Life Company's offices in Cornhill, still concealed by scaffolding, we perceive a little freshness in the treatment of the windows, which are divided by mullions; the carved entablatures and pilasters are subordinated, yet a strict Classical feeling pervades the composition. Messrs. Colls and Sons are the builders. In Lime-street, a block of new offices has been built, the fronts being of stone. The corner buildings we refer to are in a French Renaissance manner. Corinthian pilasters are introduced between the bays, but these are flatly treated, and the shafts are relieved by short flutings at the base, and below the capitals of pilasters. The carved heads of the second-floor windows, and the entablature and attic, are designed and executed in a quieter and more Classical spirit than we sometimes see. Adjoining is another row of offices or chambers in a style partaking of Venetian character, without columns or pilasters, but broad and flat in treatment and marked by some feeling. Below the windows the panels are carved with curvilinear ornament of flat character, the sunk part of the panel being only slight, but enough to give relief. This kind of enrichment cannot, at least, be charged with being commonplace; we almost tire of rows of balusters, and elaborate carved scrollwork in relief is worse, while a little change suggested by the architecture of the 16th century in Belgium or Germany may be welcome, although not pure in its origin. In the corner building of this row the windows are wide and have massive lintel heads supported by small pillars, and they are emphasised by corbelled balconettes, and various other features of Venetian character are introduced, such as the notched mouldings which surround the window-bays, and the semi-Gothic carving round the windows. In Fenchurch-avenue, two or three new structures of architectural pretensions have been built. We more particularly notice a stone-fronted block of offices, with pilasters of slight projection in three stories. The ground-story has wide rusticated piers, and these carry pilasters of much smaller diameter, while the upper row of pilasters carry nothing, but stop below a string-course in a meaningless and objectionable manner. Looking more carefully at the features of the building, there is evidence of refinement in detail, though some parts, like the pedimented doorway, show a strong Queen Anne temper, which rather spoils the otherwise quietly-treated façade. In each of the buildings we have mentioned, there is a distinctive character, and an avoidance of the commoner stereotyped and rather vulgar features of the style.

POTTERY DECORATION.*

A little technical guide-book on the decoration of pottery under the glaze, written by Miss Louise McLaughlin, Cincinnati, promises to become a popular introduction to an art now largely practised by amateurs. The authoress, from a lengthened experience, is enabled to give her readers some practical advice upon the subject of under-glaze painting. A preparation in drawing is one of the first requisites to success in the art, and as the authoress says, there is a foolish notion that anyone, however incompetent of drawing and ignorant of decorative laws, can paint upon pottery. The preliminary remarks in the little brochure before us are descriptive of the manufacture of pottery, the processes of drying and firing, &c. The difference between over and under-glaze painting is pointed out. We may quote a few passages here: "Over-glaze painting is executed upon the glazed surface of the finished ware with vitrifiable colours, having enough flux or fusible material in their composition to cause them to fuse at a comparatively low temperature, and so become attached to the glaze. Under-glaze decoration is effected by the use of colours which contain less flux, and consequently require a higher temperature for their fusion. It can be executed either upon the ware in the "green" state, or, as is more commonly the case, in the biscuit. These two methods of painting differ materially in their effects. . . . Those who are not practically conversant with the two methods can be easily

* Our reporter was not admitted at the last meeting of the Institute, and the printed proceedings from which this report is taken have only reached us on the day of going to press, and are, in themselves, incomplete—containing no report of the discussion.

* Pottery Decoration Under the Glaze. By M. Louise McLaughlin. Cincinnati: Robert Clarke and Co.

misled, and mistakes are frequently made by those who should know better as to the method employed in the case of a piece of ware in question. A certain delicacy of tint and firmness of outline characterises over-glaze painting, which is easily recognised by experts; but those who cannot distinguish between the two methods by this means, may ascertain to which class the decoration belongs by looking aslant the surface." Under-glaze decoration is more uniform on the surface than the other kind; the painting itself is more difficult, the colours being more likely to change under the great heat required. The difficulty of knowing the resulting effect can only be overcome by repeated failures, and it is this experience which the book before us is intended to supply in some measure. It is admitted that over-glaze painting possesses greater delicacy of effect and a variety of colour, though the under-glaze is the most artistic and effective, and seems to be the most rational method of applying the decoration.

The colours for painting under the glaze are prepared from metallic oxides, and are fewer in number than those employed in the other method, being confined to colours which will stand a high degree of heat. These are named, as well as the fluxes used; and the author speaks well of the finely-ground French colours manufactured by M. Lacroix. A list of the best of these which have fired well are given, and will be of service. The English carmines are said to be very satisfactory, and the Victoria green of the Worcester colours is specially commended, as a light green which stands well. Phillips's English colours are also well spoken of, especially his Mazarine blue.

The method of decoration described is said to be similar in its effects to the Haviland or Limoges faience, and the chief feature of the process, according to the writer, consists, not in the glaze, but in use of clay, which is mixed with colouring oxides capable of bearing a high degree of heat and which gives body, producing an impasto in the painting. The operation has the nature of both painting and modelling as "the high lights may be laid on so thickly as to produce actual relief." The entire secret of the method consists in the use of clays as a vehicle or body for the colours, a mixture of those partaking of the qualities of both yellow and red clays being considered the best. This clay is dissolved in water, and should be made a little thicker than the diluted clay called "slip." Ware in a "green" state, moist from the moulder, is recommended, and a heavy impasto treatment produces the richest effect. To prevent the applied clay from cracking in drying, care is necessary to lay on different layers of the same consistency, or to have the body of clay moist. We have no space to follow the writer in the directions given for painting a vase, which will be found clear and sufficient, the chief aim of the painter being directed to obtain a good even ground of two coats, so as to cover the ware, and to lay on the decorative design, beginning with the middle tint next the shadows, and lastly, laying on the high lights so as to give relief. Some remarks on "drying," modelling in relief, incising and carving follow, and the handbook will be found a valuable help to those who are desirous of mastering the difficulties in the way of this pleasing artistic handicraft.

THE VENTILATION OF DWELLING-HOUSES.*

ANOTHER edition of this treatise has been brought out, and the author of it, Mr. Frederick Edwards, jun., known as the author of "Our Domestic Fireplace," and other works on kindred subjects, while deprecating the slow and tardy recognition he has received from a section of the public press, enters afresh into the discussion, and passes in review the systems of ventilation and warming which have been recently brought forward. On the publication of the first edition we expressed our opinion on the merits of Mr. Edwards' treatise, and, therefore, we may confine ourselves in the present notice to a brief allusion to the principal suggestions the author has now to offer. Since the appearance of the author's first edition, the subject of ventilation and warming has become a pet one with sanitarians, and the literature of it has largely increased.

Mr. Edwards's book is essentially a practical guide, and the author is content with describing and commenting on the merits and shortcomings of the numerous theories and patents rather than propound a new theory of his own. And it is really this view of the question that commends itself to the practical man, for it must be acknowledged that since Drs. Reid and Arnott we are in possession of all that is valuable in the theory of the subject, the chief question being the best mode of applying our knowledge to existing circumstances. Mr. Edwards's improvements are based largely upon the sound principles which Dr. Reid and Dr. Arnott were the first to introduce into this country, namely, the control of the draught in the chimney flue; he further recommends a supply of fresh air from an external source to every fireplace, so that we may not depend on a mere chance supply by doors and windows. In his preface, he says, "In most modern grates, the principle of slow combustion, which he has been recommending for twenty-five years past, has been introduced in some form or other. . . . The principle of heating a large number of houses from a single powerful furnace, which the author discussed in the previous edition of this book, has not been introduced in this country, but has been introduced in America." The author further alludes to the unnecessary discharge of air through our chimneys, in some cases amounting to as much as from 20 to 60 thousand cubic feet of air per hour. This air is drawn from a variety of sources, through doors and windows, from the basement; it descends unused and short chimneys, comes up escape-pipes, and even drains and sewers. These evils, he contends, may be effectually dealt with by amendments to the Building Acts, which shall require properly-constructed register doors to check draught, and a compulsory admission of fresh air, from an external source, in connection with every fireplace. By these two improvements the following advantages are secured:—"(1) Economy in fuel; (2) An absence of draughts; (3) Absence of closeness; (4) Absence of smoky chimneys; (5) No rush of air from the basement, with smell of cooking, &c.; (6) Attic floors and small rooms, with short chimneys, easily warmed, and perfectly habitable; (7) The chance of the entrance of foul air by escape-pipes reduced to a minimum." No one can question the soundness of these principles, which the author thinks should receive the attention of the Legislature, and not be left to individual caprice.

In the second chapter of the work, the author describes a variety of appliances for ventilating dwelling-houses; these are divided broadly into those which provide for the entrance and those which provide for the exit of air, but the principal of these are too well known to the architect to require repetition. Perforated zinc, air bricks, sliding valves, louvre ventilators, and the kinds known as Sheringham's, T. Boyle's, Cooke's, and other forms of window-sash and door ventilators, are illustrated. Many of these are simple and self-evident forms of inlet, others like the "sun burner" system of ventilating, are revivals of old plans. Mr. Edwards combats the notion that a high-level admission of fresh air is more liable to contamination before it is inhaled than when introduced below; as regards the contrivances for admitting air, those which distribute the air are undoubtedly the best; and the author names Lockhead's, Cooke's, Boyle's Blake's, &c., as preferable to many others. Speaking of ventilators, he says, "If a ventilator to admit air in moderate quantity be provided to every window, if an open fireplace be used, and the chimney be otherwise turned to account, and if gas be only used along with effective means for removing the products of combustion, there can hardly be reasonable grounds for supposing that the chambers of our dwellings will not be as well ventilated as existing circumstances will readily permit." The author's remarks on the ventilation of basements, kitchens, ground-floors, bedrooms, and other parts of a house, are useful, though the suggestions contain little which the architect who has any knowledge of the principles of ventilation, would not readily agree with. The use of Sheringham's or some other kind of inlet to afford a supply of air to the fireplaces, without allowing them to draw on other questionable apertures, is too self-evident to require notice, and the same may be said of the value of checking or regulating the air up some chimneys by the use of registers, so as to prevent down-smoke in others. For bedrooms we think the air is better admitted through an inner wall than direct through an outer wall, as between the upper and lower sashes; and gas-burners ought to have some provision like the ventilating-lamp, for carrying off the products of combustion.

We pass to the second part of the book, which treats on warming, and in this division of the work we find the author more at home. The various schemes for getting rid of smoke are discussed, and many sensible remarks are made upon them, into which we have no space to enter. The author shows very obviously how we may burn bituminous coal in our open fireplaces with little smoke, and the principle he adopts is simply a modification of the well-known plan of Dr. Arnott. Everyone will admit the sunk ash-pit was objectionable, and the contrivance complicated, though all will acknowledge the soundness of the principle. Mr. Edwards's grate retains the best features of this grate, and is illustrated. A sort of blind or shutter to move up and down in front of the burning coal is substituted, the ash-pit is dispensed with, and a neat front is the result. The author enters into the question of fireplaces and smoky chimneys pretty fully, and quotes Captain Galton's figures bearing upon the rate air passes through the chimney, which give 4 to 6 cubic feet per second, or 14 to 20,000 feet per hour as passing up an average chimney with a fire burning.

Mr. Edwards does not claim to have done more than point out the grievances of the smoke nuisance under which we suffer, and the wasteful expenditure of our fuel. He shows that our chimneys discharge an enormous quantity of air, drawing their supplies from the worst sources, and that the remedy for this, applicable to existing houses, is, first, to check this enormous passage of air through our flues by a "regulating register," which may be closed more or less by means of a handle in the room under complete control. A diagram of this regulator is shown, and its advantage is, that it can be operated without blacking the hands. Secondly, a systematic introduction of fresh air, without draught, is necessary, to accomplish which the author proposes the air to enter warm, near the fireplace, in winter, instead of traversing our rooms. The plans indicated show openings over the grate, or a ventilating grating at the top, with a warm-air chamber behind the fire. Preferably he "adopts the system of admitting fresh warm air by carrying a smoke-flue from the grate to the ceiling with a warm-air channel around it, and to allow a second supply of fresh warm air to enter the room below the ceiling, through an open grating." This utilisation of waste heat is alleged to be a distinct improvement on Captain Galton's system. We cannot follow the author further, though the remarks on utilisation of waste heat are in the main true, and may be accepted as a fairly representative statement of the question; and, on the whole, Mr. Edwards' work may be read with profit by members of the profession, and those interested in the great question of the economy of our heating arrangements.

NEW BOARD SCHOOLS NEAR HARROW-ROAD.

LAST Saturday afternoon the Architectural Association paid a visit to the new Board Schools situated in Beethoven-street, on the Queen's Park Estate, Harrow-road. These schools have recently been erected from the designs, and under the supervision of, Mr. E. R. Robson, F.S.A., architect to the London School Board, the contract having been taken by Mr. W. Downs, builder, of Walworth-road. The design is based on what has been called the "central hall principle," and the buildings occupy a square area of some extent—a plan which, while it allows of many advantages in one-storied buildings, admits of adoption only where a large area of land can be obtained.

The ground-plan resembles in shape the letter I the hall forming the central block, the class-rooms being ranged on each side parallel thereto, and also occupying the principal front and back blocks. One-half of these are for girls and the other for boys, each side having two entrances placed in the angles. Four class-rooms (each

*The Ventilation of Dwelling Houses, and the Utilisation of Heat from Open Fireplaces, &c. Second edition, revised. By Frederick Edwards, jun. London: Longmans, Green, and Co.

29ft. × 20ft.) are thus arranged *en suite* at each end of the hall, and these form the principal blocks front and back. The class-rooms are separated by wooden partitions with sliding partitions. Entering by one of the four corner entrances, there is a plain tiled lobby with iron scraper, a cloak-room fitted with racks for hanging on one side and with ample means of ventilation, also a lavatory; we next come to the graded schoolrooms, floored with wooden blocks laid herring-bone fashion, and having a raised stepped platform for desks. These rooms are commodious, well ventilated by ceiling outlets with flaps, and lighted by large windows with the usual School Board window-sashes below, and with casements above a transom, the latter opening inwards by means of Elsley's patent

We next enter the hall, which is 65ft. long by 30ft. wide, lighted chiefly from an upper raised longitudinal skylight. The roof of the hall is constructed in one wide span, which includes the class-rooms on either side, the main rafters being continued over the side-walls of hall, and the whole forming one wide slated roof on the outside, relieved only by the centre skylight of hall. An economical construction is obtained by this plan. The principals to the hall are plain fir, stained and varnished, and tied together by iron tie-rods. The lateral class-rooms open into the hall by wide revolving shutters, fitted with an adjusting screw by G. Stevens, of Goswell-road. Boyd's stoves are provided for heating; there is a gallery at one end, and the floor is laid with wooden blocks. The walls are painted and coloured above a high dado, which is of a reddish chocolate colour. Deal desks made by Mr. Lascelles are fitted in the school and class-rooms.

The infants' school forms a separate building on the girls' side of the site. It is a plain brick building of parallelogrammic form, divided by a longitudinal wall. On one side are school-rooms, each 38ft. by 24ft., with a class-room between and a "Kindergarten" gallery is fitted up in each; between the school-rooms are sliding partitions by which the three rooms may be opened as one for assemblies. On the other side are babies' rooms and cloak-room between; the former have galleries at the corners, and are well lighted and ventilated. Isolated closets are built at each end. There is also a small lodge for a caretaker, near the entrance to the school-ground. The external features are plainly but effectively treated, malms being used for the outside walls, relieved by quoins, window-dressings and string-courses of red brickwork neatly pointed, the characteristic style of the Board School having been followed. We understand Mr. Robson has adopted a separate system of drainage, the rain-water and sewerage being kept quite distinct.

ON A COMMON BUT VITAL ERROR IN THE CONSTRUCTION OF SKEWED ARCHES.*

By Edward Sang.

IN the arrangement of a railroad we must often cross other routes or streams obliquely; thus skewed arches become a necessity to us. The construction of a skewed arch, however, involves a considerable knowledge of solid geometry. Now, in our school estimate, he is a great geometer who has mastered Euclid's first three books; he who knows the sixth is a prodigy. Yet Euclid's six books form but the first chapter of geometry proper; they are only the skimmings of the surface. Hence the average engineer shrinks from attacking the problems connected with the skew; struggles through them with doubts, leading sometimes to disaster; or, in despair, has recourse to the trussed girder.

Not those of geometry merely, the laws also of statics have to be considered; these laws, bearing as they do upon our every-day life, are ignored among our pedagogues. It is more praiseworthy to know the name of the centurion who first crossed the Rubicon, than it is to understand the action of a pair of common scissors. Hence the grossness of our ignorance of common things. We have had, in reference to the arch-stones of a skew, discussion after discussion in which the law of stability is never once adverted to. Hence, besides seeing the skew sometimes placed unsuitably to the roadways, we invariably see the courses so contrived as to offend even the commonest perception of the proprieties of building.

In building a house on a hill-slope we do not lay the foundation-stones flat on the ground and pile the courses parallelly upon them. An ordinary navvy knows how to dig the found level, and the youngest mason's apprentice knows how to try the plummet on it. It is an easily-perceived and well-known law of structure that the resisting surface should be squared to the direction of the pressure applied to it. If the surface be placed obliquely, we know that there must be a tendency to slide, which tendency can only be resisted by the roughness of the surface or by the stickiness of the mortar; and we know also that, if the obliquity be too great, both of these may fail to prevent the sliding. Hence the maxim that in a properly-arranged structure each resisting surface or bed should lie square to the pressure applied upon it.

Now, in every arch, whether oblique or not, the pressures must be from one abutment to the other: hence their directions must be in vertical planes parallel to the length of the road; while they must be inclined according to the curvature of the arch.

At the crown of a skewed arch, then, where the direction of the thrust is horizontal, the course of the arch-stone must be square to the line of road, and consequently oblique to the crown line. Now, if we place an arch-stone so on the crown line of the centring, its ends must descend either way on the sides: as we descend the inclination of the line of pressure changes, and the question presents itself, How are we to shape the course, so that at all places it may cross the line of pressure perpendicularly?

The architect, or, as he prefers to call himself, the engineer of the bridge, settles the matter at once; he makes the courses of one breadth all along like the thread of a common screw, and he perseveres in this arrangement to the very abutment; he has made no inquiry as to whether the conditions of stability be thus satisfied.

The merest glance at the result of this procedure is enough to show that everywhere, except at the crown line, the bed or resisting surface is oblique to the pressure upon it; and, as you see from the example before you, the obliquity increases as we descend upon the arch; and it must necessarily be so. The mark of each stone upon the sofit is a quadrangle, none of whose corners is right.

The actual building of the arch is begun at the abutment, and the very first operation, that of preparing the abutment to receive the first voussoir, tells us that we are wrong, for we are dressing the bed obliquely, not to the plummet, for with that we have at present no concern; but to the line of pressure, as indicated on the centring. Our very drawings tell us this. The engineer, however, complacently lays the stone down, and proceeds to build upon it in the same faulty way. He does not perceive that he is building a house on the hill-side, with the foundation and courses parallel to the ground. The placing of the crown-stones square to the road was a faint admission of the true principle, to be disregarded everywhere else.

It is not to be wondered at that structures so put together and subjected to the tremor of passing trains, should come into disfavour. Were it not for the cohesion of the mortar and its gradual hardening by carbonisation, skewed bridges built in this way would inevitably tumble.

Beginning from the crown, let us trace what ought to be the course of one of the beds. Setting out square to the line of road, and descending upon the curved surface, it crosses one of the lines of pressure, one of the sections of the arch by a vertical plane parallel to the roadway; it should cross this line of pressure perpendicularly; and this condition serves to determine its form. It is thereby required that the thickness of a course should decrease as we go down, being in all cases proportional to the cosine of the inclination; thus, in the case of a circular arch, the thickness of the course at 60° from the crown should only be half of what it was there.

From this definite geometrical law, which indeed is the translation of the mechanical one, we are able, whether the arch be circular or elliptical, or of any other form, to compute the details of the structure so arranged that the resisting surface shall everywhere be square to the direction of the pressure. In this way, since there is no tendency to slide, the whole strength of the cement goes to augment the stability of the structure.

There does not appear to be anything very difficult or incomprehensible in this law; nothing, surely, beyond the capabilities of those who claim to write "Civil Engineer" after their names; and yet it does so happen that not a single skewed arch, so far as I have learned, has been built in Britain embodying this easy but indispensable principle.

Ah! but, we shall be told, this is a new principle never before heard of. Who is to be blamed for not having put in practice what was unknown? Softly a little. I ask you to turn to the first volume of the *Transactions* of our Society, or to the *Civil Engineer and Architect's Journal* for July, 1840, and there you will learn that the whole of this doctrine was fully explained and published six-and-forty years ago. That is a long while for a true principle not to make its way, but to make no way among those who are the most deeply interested in knowing and applying it.

The other side of the centring before you exhibits the proper arrangement; which, besides that of giving all the stability attainable, has other and important advantages. Firstly, it recognises no limit to the angle of skew. Secondly, all the arch stones, except those at the ends of the courses, are approximately rectangular. Thirdly, the variety in their thicknesses makes the contract with the quarry-master much more easy.

Unfortunately, this law is expressed in the form of what is called a *differential*, which has to be *integrated* to be made of use; while the differential and integral calculus is but rarely glanced at by our engineers. Yet this calculus, the calculus of infinitesimals, is so elementary in its nature and so all-pervading in its uses that, without a knowledge of its essential principles, no one can understand how to measure the surface of a sphere, how to tell the circumference of a circle, or even how to compute the solidity of a pyramid.

* Read before the Royal Scottish Society of Arts, 28th February, 1881.

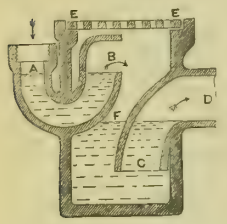
THE FRATERY, CARLISLE CATHEDRAL.

THE refectory of the Austin Canons at Carlisle, now known as the Cathedral Fratery, is the subject of an article in the *Saturday Review*, in which Mr. G. E. Street's work of restoration, now being completed, is defended against the charges made by the anti-restorationists. The Fratery is erected parallel to the church, on the southern side of the now-destroyed cloister-court; it is of Decorated character, but the large traceried windows on the south side, and the alterations about 1484, have given it the appearance of a 15th-century building. It stands on a vaulted undercroft of six bays, and measures 79ft. by 27ft. Patched up and Italianised by Machell, the clerical reviver of Classical architecture in the diocese of Carlisle, the hall had been divided into three apartments, new floors and ceilings had been introduced, and every early feature had been mutilated or destroyed. Mr. Street has thrown down the partition walls and opened out the whole apartment, with the exception of the eastern slype, and it is to be converted into a muniment room. The jamb and base of the original doorway, c. 1300, which had been replaced by Prior Gondibourne by another, which in its turn had perished, have been discovered by Mr. Street, and are being rebuilt on the old lines, exactly reproducing the beautiful mouldings. This door will be approached by a short flight of steps, and protected by the restoration of one or more bays of the destroyed cloister, of which the foundations have been dug up. The plaster ceiling and modern roof of the hall have been replaced by a semi-hexagonal coved ceiling, with tie-beams and king-posts. Machell's square-headed windows, with central mullion and transom of the familiar Cambridge type, which were being crushed by the decay of the wide oak lintels, have been removed. Some 14th-century niches, which had been used by Machell to block up the small 14th-century windows above the cloister-roof, have been placed in their original position above the high table. The external walls, of soft red sandstone, have been carefully restored, the string-courses being renewed wherever traceable; and the beautiful reading-pulpit on the south side, with its exquisite panelled ceiling, seat and water-drain for the reader, has received attentive treatment. When the restoration is finished, Carlisle Fratery will, accord-

ing to the writer in the *Saturday*, exhibit the most perfect example of a Mediæval monastic refectory to be seen in England.

A NEW DISCONNECTING TRAP.

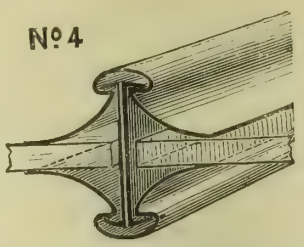
Messrs. Jas. Stiff and Sons, of Lambeth, are manufacturing a newly-invented waste-water trap, called the "Weatherly Disconnector Trap," which combines in a convenient and easily-accessible form a siphon trap, a waste-pipe, a grease trap, and an open yard gully, which we have pleasure in laying before our readers. It can be placed in any convenient position outside the house, wherever a waste-pipe discharges. The trap may be best described by the accompanying section. A B is a siphon or inlet into the outer end of which A, the waste-pipe, is introduced. It has a deep water-seal, and the discharge end, B, is so turned into the gully that no dirt can clog the siphon, nor can the slop-water be forced up through the grating E E. The end B is also made large enough to admit the hand, so as to remove an obstruction, should any occur. The exit pipe, C D, by its dipping into the gully, becomes a second trap, affording a good water-seal, and any gas from the sewer end D, which may pass through the lower trap, finds an easy and constant escape through the open grating into the air, so that double security against effluvium is obtained by this means. Grease finding its way into the trap will float on the surface of water, F, and can be removed by taking off the iron grating. It will be seen that the Weatherly trap is simple and effective in operation; it contains nothing likely to get out of order; there is no chance of its overflowing; the double trap and open grating are both safeguards against the admission of any sewer air into the house, and as the traps are distinct and independent, the foul gas can exert no pressure on the inner and upper siphon. As we have personally inspected the trap, we can safely recommend it to the profession as an economical substitute for other costly and elaborate contrivances designed to effect the same object. The whole trap measures, internally, 10in. by 9in., and 16in. in depth. The inlet, A, is 2in. diameter, B is 3¼in., and D is 4½in. diameter. There is nothing to corrode, as the entire trap is manufactured of glazed earthenware, and its price, complete, with iron grid, is only 12s. 6d.



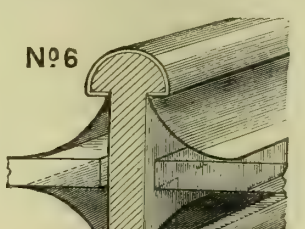
The "Weatherly trap" does in a simple manner what dozens of elaborate "interceptors" do in a more complex way: it breaks off the connection between the waste-pipes from our sinks, lavatories, and baths, and the sewer, and carries out a principle that has been universally accepted by all scientific sanitarians. We have lately spoken of the absolute importance of applying such principles in the most direct and least costly manner, if architects are to benefit by appliances, and the Weatherly trap seems to be a timely introduction. It can be simply set in the ground as a box, and the connections made, and does not require brickwork. We may add that the trap has been lately commended by Professor Corfield, M.D., at the Parkes Museum of Hygiene.

FLETCHER'S PATENT METAL SUBSTITUTE FOR PUTTY.

We have this week examined a new mode of glazing horticultural and other buildings, the principal object of which is to give a secure fixing for the glass without putty. One objection made to some systems is that the zinc bars do not fit closely to the glass throughout its whole length; the rebates or clips which take the glass are usually made rigid, and as they grip or hold the glass at only a few places where they happen to touch the uneven surface of the glass, they are liable to crack and split it, besides letting water through. In Mr. Fletcher's patent "Metal Substitute for Putty," the zinc or copper bars are so formed as to hold the glass in a less rigid manner; instead of the metal being bent at right angles to the glass, holding it as in a vice at a few points, the surfaces of metal and glass are in close contact along the edge, the former bending and adjusting itself to the inequalities of the glass, so that a firmer hold, added to a more water-tight joint, is the result. By the aid of the accompanying sections these features and the principle of the bar can be readily comprehended. No 4 shows a light zinc



or copper bar formed by uniting a top and bottom "putty substitute," making a neatly-finished moulded rib for general roofing. The chief feature, as before hinted, is the form of the metal and its relative position with the surface of the glass. Mr. Fletcher's bar, it will be seen, instead of holding the glass in a few points tightly by making the metal grip the glass at right angles, curves the metal so that its surface presses uniformly upon that of the glass, and follows any inequalities in it from end to end, thus avoiding the objections of partial grip or looseness and vibration of the glass, Another advantage claimed for Mr. Fletcher's system is that should "any moisture from condensation or otherwise become frozen between the metal and glass, the force of the expansion of the water in freezing will lift the metal rather than break the glass, so that when the ice thaws the metal will resume its position upon the surface of the glass." No. 6 shows a



section with a galvanised iron core combining increased strength and rigidity with the "substitute" and admirably adapted for large roofs. The "metal substitute" can be adapted to any form of glazing bar in wood or metal, and it has undoubted advantages for skylights which are so exposed to the sun that the usual putty joint quickly becomes brittle or rotten. For skylights the "substitute" would be used on the top only in place of the putty. Mr. Fletcher indeed does not claim as his invention a new metal bar, but rather a method of applying metal as a fixing for sheets of glass to ordinary bars. As the metals used are not corrosive, no painting is required, while the ease and facility with which the glass can be introduced enables Messrs. Fletcher, Lowndes and Co., of Westminster, to undertake contracts at a considerably less rate than those for roofs glazed upon the ordinary systems. The "substitute" can also claim to be a little less unsightly than the putty joint, and being of a moulded form will commend itself to architects as a neat form of bar for glazed roofing.

TOTLEY TERRA-COTTA.

A new company is being formed to develop and carry on the terra-cotta, fire-brick, pipe, and tile works at Totley, near Sheffield, hitherto conducted by the firm of Chadwick, Barker and Co., and, from an inspection of the terra-cotta manufactured, we believe with a fair prospect of success. The specimens of paving-tiles we have examined in white, red, and other colours are hard and true in shape, and of a quality leaving little to be desired. Stable bricks and gutters, copings and curbs, ridge tiles, ornamental tiles, crestings, chimney-tops, &c., are among the more useful class of wares made besides sanitary goods; but we find the company intend to develop the architectural branch of their business in the manufacture of features and details. Trusses, capitals, mouldings, ornamental panels, balustrades, form a large class of the articles manufactured, and from our examination of some of the modelled work, we have little hesitation in saying the clays procurable are capable of being modelled into every useful variety of architectural or modelled ornament. Mr. F. Barker, member of the late firm, and formerly a Liverpool contractor, takes the position of managing director, and Mr. E. Griffiths, of 44, Finsbury-circus, is also on the directorate.

BUILDING NEWS DESIGNING CLUB—A VILLAGE INN AND SHOPS.

We have received for this subject a large number of creditable designs, some in a 16th century half-timbered style, and many of Jacobean character. The chief fault we find is the extravagant pretensions of some of them, and the large corner inn with rooms that would suffice for the wants of many a suburb to an important town. (1) "Veronese" has been happy in treating in a rather picturesque French fashion the corner inn and shops, and in combining brick and stone and timber with much artistic breadth, though we might accuse his design of a little inconsistence and whimsicality in parts, as the shallow corbelling of the upper floor, corner windows in the tower, the small public entrance doorway, the cornice over dormer windows, the brick interpolation generally.

In the plan there is much that might be improved. The position of the bar is central, but it is hardly near enough to the kitchen for useful service, and its lighting sometimes would be rather doubtful. The public entrance porch is awkward, and the tap-room at the corner could only be reached by passing through the bar, which would be inconvenient. On the other hand, there is a degree of compactness and snugness in the arrangement. There are two entrances, the private part of house is tolerably well cut off from the public, and the bar is sufficiently screened from the entrances as not to be draughty or obtrusive. A bar-parlour 14ft. by 9ft., a tap-room 17ft. by 13ft., a snuggery 12ft. by 11ft. 6in., besides the bar and kitchen, are provided on the ground-floor, and the walls are disposed and broken so as to produce quaint homely comfort. The bedroom plan is convenient. The shops are 16ft. square, with a living room and scullery behind, and two bedrooms over. We fail, however, to see how the stairs is lighted, unless by a skylight. The elevations do not quite agree with the plans: we find a chimney omitted from bedroom over shop. (2) "Pupil J." This design runs the first very hard, and had the rooms of the inn not been so small, we might have placed it first. The author has produced a well-contrived and compact plan, the entrances are well placed; the bar is snugly located in convenient proximity to the kitchen and public entrance, and a small dining-room for strangers is obtained close to the private entrance, well separated from the public part. The stairs, conveniences, and lighting on both floors have been all considered. The shops are small, but the planning and entrances convenient, and there is a private door with vestibule between shop and house, so that the rooms above might be let for apartments if desired. The elevations, in a Late, timbered-gable, Gothic style, are well adapted and characteristic, and the recess with seat, below an overhanging story of the inn, is useful. Grouping and details are both satisfactory, and the author has been successful in imparting a village homeliness, and in losing not an inch of ground wastefully. (3) "Walter." This design has also the merit of extreme simplicity, grouping, and character, it is in an Old English Domestic style, suitable for brick and parget work, but the plan covers more area, and is not economical in arrangement. The large corner bar, 23ft. by 16ft., is too large, and the counter in excess of village requirements; the side entrance is narrow and insignificant, and the staircase would be ill-lighted through the small fanlight over door. The offices are not compact. With respect to the shops, we might say they are roomy, but there is little to commend, and it is to be regretted so well-conceived an external design has not been worked out with more study. The drawing is creditable. (4) "Nemo" has been less successful this time. We can speak with

commendation of his neat effective drawing, and also of the talent exhibited in the details of the elevation, which is in a sort of Gothicised Queen Anne, but it is wanting in rhythm and cohesiveness. The windows on the side of inn are too various in size and style, and the gabled upper story destroys the breadth, and altogether there is too much that is restless in the design. The fault of the plan is that it assumes the pretensions of a small town hotel, and the bar is too large and too far away from the kitchen. One good feature is a club-room on the first floor of inn, but it is rather larger than would be required. The shops are certainly narrow, and the stairs are not well lighted. (5) "Per" is a quietly treated elevation possessing much character; the roof over the shops is kept low, the upper story being lighted from lofty dormer windows which project over the lower ones. The side elevation has been incorrectly drawn, the entrance is shown cramped between the bay windows, while the plan shows a much wider entrance. In the plan the author has run away with the idea of a town hotel. Why the large coffee-room and a bar big enough to supply refreshments at a metropolitan station? "Per" has to learn to plan with economy and effect; his offices are arranged after a very stereotyped town fashion. (6) "Jack" sends a spirited sketch in a kind of Jacobean, racy in parts; but the corner inn is excessively large, the two public bars measuring in area 24ft. by 23ft. 6in, and the planning is more suitable for a small town inn of the first class. Despite its cleverness, there is room for improvement; the upper landing is wasteful and the stairs narrow; while of the shops we may remind the author it is not necessary in a village to occupy nearly 30ft. of frontage with a parlour and staircase, besides the shop. (7) "In Hoc Signa Vinces" fails in the plan; the bar is too large, the corner entrance is objectionable, and the narrow passage from the side entrance, together with the position of bar-parlour and kitchen, are not convenient or well-considered. The elevation, except the narrow pointed corner doorway, possesses merit; the gallery or verandah from club-room window, and the half-gabled treatment of shops are suitable features designed in a sensible manner. Timber framing and tile-hung gables are the principal features, and these are introduced with moderation. (8) "Black and White." There are some good points in the elevations; the style, Late Domestic, has been plainly treated in brick, timber, and tile, but the inn is far too large, and covers a larger area than is desirable; the planning is wanting in compactness, and the shops and private entrances also take up frontage unnecessarily. (9) "Bonus Hominus." A neatly drawn and characteristic elevation, in a Domestic English style, makes the public bar too large, and the entrances and passages destroy the internal economy; the kitchen is too far from the bar and commercial room, and the private entrance is awkwardly planned. The shops are more suitable. (10) "Fidelis" also has mistaken requirements, the corner building has more the pretensions of a hotel, the passages are unnecessary, and the rooms too large. In elevation the treatment, brick and timber work, is suitable and inexpensive for a brick or timber locality. (11) "Black and White" (2). This design, in a similar style, cleverly drawn, indicates merit; but there is a lack of method and grouping in both plan and elevation; the bar and entrance are not well disposed, and there is a general awkwardness in the arrangements. The upper plan is better and shows a large meeting-room. (12) "Cui Bono" is a very effective and neatly drawn elevation in brick and timber framing. The inn, only two stories high, has an octagon-ended bay at the corner, which forms a good recess in the bar parlour, but the public entrance and bar are too narrow, and the bar counter would have been better set further back. The plans of shops, and the way the parlours are squeezed up by the kitchen and stairs, not to mention the position of w.c., and the ill-lighted stairs, are faulty. "Beta" goes in for a large corner bar with side windows, and we must say of the planning that it is wanting in contrivance and compactness; the back passage, too, and conveniences are awkward. The shops also are rather cramped by the passages. In other respects the design is in a suitable Queen Anne brick style, the shops and inn being contained under one line of roof. The billiard-room is a good provision, but the entrance to it is narrow, and the inner passages and bedrooms wasted. "Frank" sends a well-drawn Late Gothic, but expensive row with timber-framed inn, between which and the shops is an archway to a stable yard. The inn is tolerably complete, but unsuited for a village. On the first floor a large club-room, 32ft. 6in. by 15ft. 9in., is obtained, extending over the archway. The shops have a common private entrance between two of them, besides the shop door. The upstair kitchens are objectionable, and would be of service only if the first-floor was let separately. Motto "A" is neat in style, but the stairs to inn are not lighted, and the long passages at side of shops are wasteful. In other respects the design is suitable. "Fiat" has too expensive a plan, and the staircases are not well lighted; the shops also are large. The author suggests a club-room: of the elevation, though rather over-timbered, it is suitable. "Alpha" smacks too much of the suburban tavern; the approach to bar and the other arrangements are not the happiest, and the adoption of a Queen Anne brick style might have been a trifle more in keeping if the corbelled pilasters and other extravagances of the style had been omitted, and a more moderate treatment adopted. "Endymion" is well broken and picturesque in its features. The covered porch and seat is a good feature, and the bar is well placed, but the passages destroy the comfort of the house and take up room. The shop arrangements are fairly planned, at least as regards the stairs and entrances.

Of a numerous class of designs we can only find room to say they have exceeded the conditions and justifiable expenditure, whatever merits they may otherwise display. "Norman" has a large corner inn with public bar, and the elevation is in a brick and half-timbered style, with some respectable features and detail. "Lancaster" errs in the same direction; the entrances are not well managed, and the timbered fronts look finical and too showy; "Kelme" is particularly extravagant in plan and elevation; V in circle, Ernest, Nil Desperandum, No. 2, are also costly in plan or style, and a similar remark as regards plan applies to the design with initials A. L. B., That's my Idea, Trial (the last has an effective elevation), Ambition, Ogmore, H. C. in circle, Nil Desperandum. Some of these designs exhibit ability and careful drawing. A few other drawings must also be enumerated, but their authors have lost sight of the rural character and moderate requirements of a village population. Hubert, York, Hope, B. J., Good Luck to your Fishing, are all weak in planning, more or less, and the elevations in some cases would be far more appropriate in a town or suburb than a rural locality. It is one thing to draw an elevation, but quite another to design it so as to make it agree in character with a particular locality. To seize this character, to make the building harmonise with its environment, should be the great aim of the architect in every work.

Only three designs have been sent us for the sedilia, and, in order of merit, "Con" in circle comes first, "Utile Dulci" second, and "Ogmore" third. Both the former are, however, extravagantly florid. We did not require costly tabernacle-work canopies, but a plain treatment in wood.

WORKED EXAMPLES IN GEOMETRICAL DRAWING.*

THIS is rather a supplementary treatise for the use of students preparing for the examinations than a text-book on geometry. The author, the Rev. John Hunter, M.A., publishes it with a conviction that a greater number of worked examples, especially in scale construction, is necessary than will be found in any other book, and that the solutions of problems should be given with demonstrations. Our knowledge of a few recent text-books corroborates Mr. Hunter's belief, and we think he has been doing a useful service in giving the working out of a few of the more important questions in scales. To give our readers an illustration of the way in which Mr. Hunter handles his subject, we are tempted to quote the first example given. "The distance between two towns is 15 miles, and their positions on a map are 8¼in. apart. Calculate in an explanatory way the representative fraction of the map." After defining the representative fraction of a drawing as the *ratio* that the distance from point to point on the drawing bears to the real distance represented; the author proceeds, "If two towns are 15 miles apart, and two points indicating the positions of these towns on a map are 8¼in. apart, the drawing is on a scale of 8¼in. to 15 miles, or, in common denomination, 8¼in. to 12in. × 5280 × 15, or $\frac{33}{12 \times 5280 \times 60}$; and this abstract fraction reduced to its simplest form by cancelling becomes $\frac{1}{11520}$ which is the representative fraction." Similarly other samples are worked out, and the construction of scales of various fractions are explained, which will be found of great use not only to those preparing for examinations, but to all architectural and engineering students.

The problems worked out are well chosen and useful: such as to divide a straight line into any number of equal or proportional parts; to find proportionals to any other lines; the construction of triangles from given lengths of sides, drawing tangents, &c. The problems are followed by a selection of exercises, many of a useful and practical character, and we have no hesitation in recommending Mr. Hunter's little book to all students and others engaged in instruction.

* Worked Examples in Geometrical Drawing. By the Rev. John Hunter, M.A. London: Longmans, Green, and Co.

MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS' ASSOCIATION.

A DISTRICT meeting of the Northern branch of this association took place at Blaydon on Friday, Mr. A. M. Fowler, of Newcastle, in the chair. Mr. R. S. Rounthwaite, borough surveyor of Sunderland, read a paper on "Wood Pavements." Nearly two miles of roadway have now been laid in Sunderland with wood blocks, and the author stated that he had had to modify his opinions as to the safety for traffic of the material, and, after considerable experience, now considered that wood paving was no more dangerous than granite sets if it were properly laid, with comparatively close joints, and if kept scrupulously clean. Wide joints served to accumulate dirt, which soon became dangerously greasy, and with 3-inch blocks a space of ⅜in. between each course would be found sufficient. The most recent system of laying adopted in Sunderland was to excavate to a depth of 12in., and then on a concrete foundation of one of Portland cement to one of clean ballast, 3-inch blocks, having a depth of 6in., were laid. These blocks were of seasoned redwood, Memel and Dantzic being preferable to that from Riga, but in any case impregnated with creosote in the proportion of, at least, 10lb. per cubic foot. The joints were run with a mixture composed of one gallon of creosote oil to one cwt. of pitch, alternated three times with coats of fine gravel. A paper on "Roadways" was read by Mr. Jam Hall, borough surveyor, Stockton-on-Tees. Both for broken metal and paved roads the most important matter was the foundation, which should be provided with drains to carry the water to and along the sides of road. For heavy traffic Portland cement concrete was the best foundation, as it improved with age. In the North of England slag was largely used, either by itself or in concrete. Scoriæ bricks, as made and used in Stockton, formed a cheap and noiseless pavement, but their durability varied greatly. Resolutions were passed in favour of having the general secretary of the society located in Lancashire or the West Riding of Yorkshire (Mr. Graham, of Westminster, the late secretary, having resigned), and of having the next annual meeting in London, The members subsequently visited Messrs. Harriman and Co.'s pipe-works; the works of Messrs. Smith, Patterson and Co., ironfounders; and the ironworks of Messrs. Douglas Brothers.

A Local Government Board inquiry was held at Ilfracombe on Tuesday week before Mr. S. J. Smith, C.E., relative to an application from the local board for leave to borrow £4,000 for new waterworks, and £500 for flagging the High-street. At the suggestion of the inspector, the town council agreed to ask for £500 more in order to cover the clerk of works' salary and legal expenses in connection with the waterworks.

TOMB TO ARCHBISHOP MEOPHAM, CANTERBURY CATHEDRAL.—SHOPS AT NORWOOD.—LAMBETH INFANT-SCHOOLS.—NEWTOWN CHURCH, EXETER.—NEW OFFICES AT READING.—DRAWING-ROOM, BLACKHEATH, CLONTARF, IRELAND.

OUR LITHOGRAPHIC ILLUSTRATIONS.

TOMB OF ARCHBISHOP MEOPHAM, CANTERBURY CATHEDRAL.

Archbishop Meopham's tomb forms a screen dividing St. Anselm's Chapel from the south aisle of the choir of the cathedral. The canopy of the tomb, together with the large shafts and jambs, is of stone; the body of the tomb, with the small shafts and bases, being of black marble. The date is 1333.

SHOPS AT NORWOOD.

These shops, now building in High-street, Norwood, are from the designs of Mr. Arthur Cawston, architect, of Clement's-lane, E.C. The buildings are in red brick, and are covered with Broseley tiles, the woodwork being painted white.

LAMBETH INFANT-SCHOOL BUILDINGS.

The new infant-school buildings of St. Mary's, Lambeth, have been erected upon a site kindly given by the Archbishop of Canterbury, with a frontage to the high road, a little beyond the church and Palace. The necessary funds were supplied mainly by the accumulated stock belonging to Archbishop Tenison's School, in the hands of the Charity Commissioners, by whom permission was granted to the trustees for its appropriation to the above-named purpose. The buildings are from the design of Mr. John P. Seddon, architect, of No. 1, Queen Anne's-gate, and were erected by Messrs. Belham, builders, of 155, Buckingham Palace-road. The accommodation provided is for 300 children: and comprise a large schoolroom 54ft. by 25ft., and two large classrooms, to one of which is attached a small room to serve as a crèche for the very little children, who, when wearied, may sleep there quietly. There is a playground behind, part of which is covered over. The buildings are well heated throughout by stoves and lighted by gas, and the walls decorated and hung with pictures to give a cheerful aspect. In one of the classrooms the end group of windows is filled with stained glass, the gift of a friend of the school; one couplet, in memory of Mrs. Tait, represents Christ receiving little children, and the other, to Archbishop Sumner, with subjects bearing upon "Faith working by Love." At one end of the group of buildings is a mistress' residence, fitted into an irregular portion of the ground in a somewhat picturesque manner. The entire cost of the structure and its contents has been about £2,500. The materials are stock brickwork relieved with red bricks, and the roofs are covered with tiles. The site having been a portion of the Lambeth Palace grounds, there is a background of foliage giving a pleasant rural appearance in the heart of the metropolis. The Bishop of Rochester, at the recent opening of the schools by the Archbishop, stated that they were the best group of buildings of the kind he had seen, and that by their picturesque and yet modest, unpretending character, excelled the much larger and more costly piles of buildings in their neighbourhood.

NEWTOWN CHURCH, EXETER.

Some short time since there was a competition among local architects for the proposed church to be erected by the Exeter Church Extension Society for a district taken out of the populous parishes of St. Sidwells and St. James. The plans being submitted to Mr. E. R. Robson as professional referee, he reported in favour of those with the motto of "Laus Deo," prepared by Mr. R. Medley Fulford, A.R.I.B.A., of the Close, Exeter, and the Committee followed Mr. Robson's advice, and commissioned Mr. Fulford to prepare the working drawings. The building is to be of local brick, with Beer and Box Ground stone dressings externally; and buff brick from Candy and Co.'s works, Chudleigh-road, with bands of a local red stone, and Hamhill internally. The shafts to the nave columns will be monoliths of red granite. The roofs to be "barrel" ones of deal and pitch-pine, and covered with slate. The only alteration made in the design since the competition is in the west tower; the "saddle-back" tower shown in the original design being at the west end of north aisle, whereas the present one is at the west end of nave, open to the interior, and of more stately proportions. The Newtown board schools adjoin the site, and a portion of same appear in the drawing; they were erected some years since from the design of Mr. P. B. Hayward. The total length of the interior is 121ft., and 64ft. across the transepts, and will accommodate 820 on the ground-floor. There will be a gallery in the tower at the west end. The height, to the summit of the slated roof of tower, is 130ft. The work is to be commenced forthwith, and if funds will not admit of the whole being undertaken this year, a contract will be entered into for the erection of nave, transepts, and aisles, exclusive of chancel and tower above the level of ridge of nave roof.

NEW OFFICES, ETC., ABBEY WHARF, READING.

This building, which is now almost completed, has been erected to meet the growing wants of Messrs. Ridley and Sons, timber-merchants, of Reading and Staines. The work is of simple character, but is substantial in construction. The half-timber work is of solid oak, filled in with brickwork and plaster, the oak generally being left as it came from the saw, and without application of stain or paint, &c. The light for offices is chiefly obtained from the side of the building overlooking the timber-yards, because the roadway being narrow, and the traffic of heavy timber over it considerable, it was thought desirable, both on the score of safety and quietness, to adopt this arrangement. Mr. W. Ravenscroft, of Reading, is the architect.

BLACKHEATH, CLONTARF, DUBLIN.—NEW DRAWING-ROOM.

This sketch gives the interior of a ball-room, which forms part of additions to this house before illustrated in the Building News. The apartment terminates with a semi-circular end, as shown in the view, and has a large bay window on one side, and on the other an ante-room or recess bay, opening into the ball-room proper. The room is about 40ft. long, and 40ft. measured across the bays. The pilasters throughout are framed with moulded walnut stiles and panels of delicate Cinque-cento-like work, in low relief in sycamore; it being intended to body-in the ground in low-tone colour, leaving the sycamore in the carving of its natural colour. Dublin has been always famous for its beautifully free and artistic stucco-work of the last century, the work of Italian settlers and French refugees, and it is much to be regretted that before this all disappears, some enterprising artist does not undertake the drawing and publication of some of the good examples of ceilings, &c., hundreds of which remain in private houses and elsewhere; while in the last few years hundreds have disappeared. An attempt has been made in the stucco-work work of this new ball-room to revive something of the high artistic character and freedom of modelling suggested by old examples, and all the enriched work has been specially modelled by Messrs. Sharpe and Emery, architectural sculptors, of Dublin, and finished by a carver; some of the details, such as birds, &c., being fixed in rough plaster and carved in their places. The result has been work of more than ordinarily good artistic character, at a by-no-means extravagant cost. The architect is Mr. Thomas Drew, R.H.A., of Dublin.

COMPETITIONS.

Pontefract.—A special meeting of the Pontefract Corporation was held in the Town-hall on Thursday, Feb. 24, the Mayor (Mr. John Rhodes) presiding. The sub-committee of the proposed new town-hall produced the amended plans as altered by Messrs. Bulmer and Perkins, of Leeds and Harrogate, the estimated cost to be £7,400. Mr. Barker proposed and Mr. T. Wordsworth seconded a proposition that the plans be not received, inasmuch as the previous estimate of £7,000 had been exceeded. Alderman Gott moved that the minutes of the committee be confirmed, which was seconded by Mr. Barstow, and supported by Ald. Robson, and on being put to the meeting the amendment was carried by 16 to 7 votes. It was further resolved that the new Town-hall committee be empowered to at once proceed with the work, and advertise for tenders.

Trades' School Competition, Bristol.—The Society of Merchant Venturers of Bristol desire to put up a healthy and commodious building at as small a cost as is consistent with thoroughness, abundantly supplied with light and air, and so arranged as to be well adapted for technical, scientific, and general work of the kind now carried on in science schools. In response to their advertisement, 21 sets of plans were sent in, the estimates of cost varying from £12,000 to £22,000. The society have awarded the premium of £100 to Mr. Stuart Colman, of Bristol. They were assisted in making their selection by Mr. Robson, the architect to the London School Board, who reported upon the whole of the plans sent in.

Burton-on-Trent Workhouse.—At the meeting of the Burton board of guardians held on Thursday, the 24th ult., a report was received from the building committee as to the designs for the new workhouse, obtained in the recent limited competition. These had been sent in by Mr. J. H. Morton, of South Shields, the cost of which was estimated at £35,538 1s. 11d., and by Messrs. Wilson, Son, and Aldwinckle, of London, the estimated cost being £32,772 6s. 2d. The committee recommended the adoption of Mr. Morton's plan, and explained that the extra cost of £2,538 was due to the fact that all the buildings were designed by Mr. Morton as two-storied. The board adopted the report, and accepted Mr. Morton's design, appointing its author architect for the new workhouse, at a commission of 4½ per cent. on the total cost of the buildings. A premium of £30 was voted to Messrs. Wilson, Son, and Aldwinckle.

CHIPS.

The dates fixed for the sending in of works intended for the annual exhibition of the Royal Academy have just been published, and are as follows:—For paintings, drawings, &c., Monday and Tuesday, March 28 and 29; for sculpture, Wednesday, March 30.

The Stock Exchange is about to be considerably enlarged, from the design of Mr. J. J. Cole, of 24, Finsbury Circus, at a probable cost of a quarter of a million.

The Wolverhampton Board of Guardians opened on Feb. 18th twenty tenders, ranging from £2,078 to £3,076, for the extension of the workhouses premises, on the Eagle-street side, and accepted the lowest, that of Mr. S. Teece, of Darlaston, who had amended his tender previously to the meeting of the Board by striking off £110; it now appeared on breaking the seals that even at £2,188 it would have been the lowest offer.

The restoration of the west front of Lichfield Cathedral is progressing, and the north-west spire has just been commenced; it is found to be in worse condition than had been anticipated. The new figure of Peda has just been placed over the central door in the great façade; and on Thursday week the figure of Our Lord, given by the Bishop and executed by Miss Grant, arrived in the city; it will replace a statue of Charles II. over the west window.

BOOKS RECEIVED.

Lockwood's Builders' and Contractors' Price-Book for 1881 (London: Crosby Lockwood and Co.) has had several additions made to it in the particulars and prices of labour and material, and will therefore be found more useful than ever. ——*Spons' Architects' and Builders' and Contractors' Pocket-Book for* 1881 (London: E. and F. N. Spon) is considerably extended, but is, nevertheless, as handy and convenient as it is accurate and reliable.——*Bevis's Builders' Price-Book for* 1881 (London: Bevis and Co.) has, it is stated, had a very favourable reception, and is now issued for the fifth time.——*The Rudiments of Civil Engineering*, by Henry Law, Sixth Edition, revised by D. K. Clarke (London: Crosby Lockwood and Co.), has been almost rewritten by its reviser, who has added nearly three hundred pages of fresh matter, and has brought an old and reliable text-book thoroughly up to date.——*Measures, Weights, and Moneys of all Nations*, by W. H. B. Woolhouse, F.R.A.S., &c. (London: Crosby Lockwood and Co.), is the sixth edition of an exceedingly useful volume of Weale's Rudimentary Series. The work also embraces an analysis of the Hebrew, Christian, and Mahometan calendars.——*Electrotyping*, by J. W. Urquhart (London: Crosby Lockwood and Co.), has some good information in it; but much more that is mere padding. The first part of the book might have been condensed considerably, and the second—which alone really treats on the subject-matter indicated by the title—is not always reliable, and seldom coherent. ——*What Girls Can Do*, by Phillis Browne (London: Cassell, Petter, and Galpin), is the second edition of a very pleasantly-written book for mothers and daughters.——*A System of Practical Arithmetic, for the Use of Schools*, by Samuel Young (London and Manchester: John Heywood), contains much information not usually to be found in treatises on arithmetic, having special reference to cotton-spinners, millwrights, engineers, and builders.

PROF. NEWTON ON GREEK ART.

THE third of the course of lectures on Greek Art in the age of Pericles, was delivered by Professor Newton, on the 4th ult., at the University College, and dealt with architecture and history of the Parthenon, and its chryselephantine statue of Athené. The temple of Athené Parthenos was shown to have consisted of two unequally-sized chambers, of which the smaller, that at the rear, was the treasury, and the larger contained the magnificent statue of Athené, constructed in ivory and gold by Phidias. This temple was finished about B.C. 438, and remained perfect till at least the time of Plutarch, who, in the second century of our era, described it as possessing all the freshness of youth. Converted into a church on the establishment of Christianity, it was used successively by the Byzantines, the Latins, the Venetians, and the Turks, by the last of whom it was refitted internally to serve the purposes of a mosque, and it was finally restored to the Greeks about half a century since. The exact position in the temple of the famous chryselephantine statue was unknown; the older opinion was that an oblong space on the floor of the larger chamber, paved with inferior marble, marked its site, but German archæologists had held that the statue stood much closer to the wall dividing the chambers, and they had professed to see traces of a recess in this wall. Mr. James Fergusson had adopted the older theory as to position, but propounded a new view as to the Parthenon itself, which he said was not an open space, but roofed over, and lighted by clerestory openings. The statue itself was stated by ancient writers to have been 32ft. high, exclusive of the base; it was of gold and ivory, the flesh being represented by the latter and the garments by the former material. Many rude and imperfect representation of the statue existed on coins, gems, &c., but these did not agree with one another. The most noteworthy of modern restorations was that made by M. Quatremère de Quincy, about half a century since, which curiously agreed with the independent restoration made by Flaxman for his lectures on sculpture, but both of which had been proved to be inaccurate by comparison with ancient delineations, and still more on reference to the statuette of the same goddess recently found in Athens. The lecturer then described the rich frieze which surrounded the exterior of the cella, the well-balanced sculptural compositions in the pediments at either extremity of the temple, and the vigorous metope subjects between the triglyphs, explaining that a great portion of these beautiful sculptures were now to be seen in the galleries of the British Museum.

The fourth lecture of the course, delivered a fortnight since, was devoted to the recently discovered statuette of Athené, which was illustrated by photographs and a drawing to full size. Professor Newton pronounced it to be a reduced copy, in the dull, lifeless, Roman manner, of the famous statue. In this statuette, which was of marble, the goddess had a helmet with three high crests, and having a sphinx in the centre and a griffin on each side. Over the breast was the ægis covered with snakes, in the centre of which was the Gorgon's head. Below this was a richly-flowing garment, flowing to the feet, and this was apparently folded or covered an under garment. The arms were bare; in the right hand was a victory, unfortunately headless; the left hand rested on a shield. This statuette agreed with the description by Pausanius of the chryselephantine statue, in which it was stated that on the outside of the shield held in Athené's left hand was depicted in relief the battle of the Greeks and Amazons, and on the inside the battle of the gods and giants. He also referred to a spear, held in the left hand as well as the shield. Under the right arm of the statuette was a column, for which there was no authority, and which the lecturer believed was only introduced to support the arm of the statuette. The figure of Mercury carried in the right hand of the original statue must, he thought, have been supported by a bar of copper, concealed in the frame-work upon which the gold and ivory was built up. Professor Newton announced that his fifth lecture would be delivered on the 4th March (to-day, Friday) at 4 p.m., when he would describe the frieze, and that a supplementary lecture would be delivered on the following Friday, the 11th, in which he would treat of the sculptures of the Temple of Zeus, at Olympia.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—On Saturday afternoon last the association visited the new Wesleyan College, at Handsworth, which is now approaching competition. Owing to the inclemency of the weather, there was only a small number of members present, among them being Messrs. E. Pincher, E. Wood, and W. H. Kendrick, of West Bromwich, F. E. F. Bailey, and J. Ellis, of Walsall, Fred. G. Hughes (hon. sec.), &c. The architects, Messrs. Ball and Goddard, being unable to attend, Mr. Osborne, the clerk of works, conducted the party. An ordinary meeting was held on Tuesday evening (March 1), at the Rooms, Queen's College. Mr. O. Essex occupied the chair (Mr. Morgan, the chairman, being absent). A vote of thanks was passed to Messrs. Ball and Goddard, architects of the new Wesleyan College, Handsworth, for permitting the members to visit that building on Saturday, the 29th ult. A vote of thanks was also passed to Mr. Osborne, the clerk of works, for meeting the party. Mr. A. Reading delivered a brief lecture entitled, "The Proportions of Ancient Classical Buildings and their Application to Modern Design," for which a vote of thanks was accorded to him.

The annual dinner of the Lincoln Master Builders' Association took place the other night, Mr. W. Kirk, president, occupying the chair, and Mr. H. S. Close the vice-chair. It was reported that the Association was in a highly satisfactory condition. The Vice-President and Secretary both spoke upon the Employers' Liability Act and its probable effect on the building trades, and it was stated that a general insurance fund was proposed to be established by the National Master Builders' Association.

Instead of oil, which thickens and makes the stones dirty, a mixture of glycerine and alcohol is used by many. The proportions of the mixture vary according to the instrument operated upon. An article with a large surface, a razor, for instance, sharpens best with a limpid liquid, as three parts of glycerine to one of alcohol. For a graving tool, the cutting surface of which is very small, as is also the pressure exercised on the stone in sharpening, it is necessary to employ glycerine almost pure, with but two or three drops of alcohol.

Building Intelligence.

Bournemouth.—The new church of St. Paul, Bournemouth, was consecrated on Tuesday week. The first portion of the church has been erected from the designs of Mr. Augustus H. Parken, F.R.I.B.A., Bournemouth, and is in the Early English style. At present, an apsidal chancel, north and south transepts, a central tower, and two bays of the nave and north aisle only are built. This portion will accommodate about 300 worshippers. The rest of the nave, and possibly a south aisle too, will, it is hoped, follow at some early future date, and the church will then afford sittings for 700 persons. The exterior walls are of Purbeck, and the dressings are of Bath stone. The pulpit, which is the gift of the architect, is of Bath stone, and is the work of Mr. Harry Hems, of Exeter. The contractors for the whole of the works are Messrs. Hale and Son, of Salisbury. The tile pavements were supplied by Mr. W. Godwin, of Hereford.

Bristol.—A new Baptist chapel, at Totterdown, was opened yesterday. The new chapel will accommodate 500 persons on the ground-floor. The style is Italian, and the chapel 40 feet wide, 82ft. long, and 26ft. high to wall plate 38ft. to collar-beam. The general contract has been taken by Mr. A. J. Beaven, of Bedminster, at the sum of £2,175. The work has been carried out under the superintendence of Mr. Alfred Harford, architect, of 30, Broad-street, Bristol.

Edingale.—On St. Matthias' Day the church of the Holy Trinity, Edingale, was reopened, after having been entirely rebuilt under the direction of Mr. Charles Lynam, architect, Stoke-on-Trent. The new church consists of a nave, chancel, and vestry leading out of the chancel, with tower carried up over the vestry to the height of about 50ft., and including organ-chamber, belfry, and heating chamber. It is in Early English style, and is built of red brick with stone dressings, lined internally with white brick. The roof is open-timbered, and the flooring is of plain tiles with wooden bricks between the seats, which are open benches. The nave is artificially lighted by Jones and Willis' new Hesperus lamps depending from the roof-timbers. Accommodation is provided for 130 worshippers. The work has been performed by the contractor, Mr. Robert Young, of Lincoln, and the total cost has been about £1,800.

Haworth.—On Tuesday week the church of St. Michael and All Angels, Haworth, and erected upon the site of the old church, so closely associated with the Brontë family, was consecrated. The style of the new church is Perpendicular, and the masonry is of local sandstone. The interior of the church presents the usual features. The roofs are of stained deal, that of the nave being of hammer-beam construction, with moulded intermediate rafters. The interior walls are plastered, and they will shortly receive decoration. The whole of the arches, capitals, &c., are of simple masonry, without carving or elaborate detail, the only exception to this rule being the blank arcade, or panelling in the eastern bay of the chancel. The old tower is worked into the new building. Accommodation is afforded for 500 adults and 130 children. The cost will be about £7,000. Messrs. T. H. and F. Healey, of Bradford, are the architects.

Claughton.—Christ Church, Claughton, was opened last week after enlargement. A new north chancel aisle, with additional sitting accommodation for 70 worshippers, is provided, whilst an organ-chamber and vestry correspond on the south side. The space formerly occupied by the organ in the west gallery is now seated to accommodate an additional 120 free sittings. The heating arrangements have been carried out by Mr. Gibbs, of Liverpool. The general works have been executed, at a cost of over £2,000, by Mr. James Bratt, contractor, of Rock Ferry, from the designs and under the superintendence of Mr. David Walker, architect, of Liverpool.

Denmark Park, S.E.—The new church of St. Saviour, Copleston-road, S.E., was consecrated by the Bishop of Rochester on Tuesday week. It consists of a nave with aisles, transepts, and chancels, and seats 1,000 persons. The style is Early English, and the walls are of white brick facings, with Bath stone dressings. The internal wall surfaces are of gauged brickwork, and

the voussoirs of arcades are of alternate courses of blue and white stone. The roof is parallel, and the building is pewed. Above the altar is a window filled with stained glass by Messrs. Gibbs and Howard. Beneath the church is a vestry and other offices, and adjoining is a parsonage, provided, like the church, at the sole cost of Mr. Francis Peek. The architects were Messrs. Weeks and Hughes, of Tunbridge Wells; the builder was Mr. E. Terry, of Bellenden-road, Peckham, and the clerk of works was Mr. S. Burdett.

Metropolitan Board of Works.—At the meeting of this board on Friday, plans prepared in the superintending architect's department for the enlargement of the head-quarters of the fire-brigade in Southwark-bridge-road were adopted, and the brigade committee were authorised to make arrangements for the erection of the new buildings; the estimated cost was between £13,000 and £14,000. A communication was received from Sir W. V. Harcourt, stating that he could not, as Home Secretary, sanction the proposal in the Board's Various Powers Bill to repeal the 33rd section of the Streets' Improvement Act, relating to the provision of accommodation for the labouring classes who might be displaced. It was decided to refer the matter to the works committee, with power to withdraw the clause if necessary for the passing of the Bill. Revised plans of the works proposed to be carried out for the prevention of floodings in the Chelsea district, and prepared in the engineer's office, were adopted.

Leicester.—The new buildings for the Leicester Secular Hall, now completed, occupy the site of the old Secular Club premises. The style is a free treatment of Flemish Renaissance. Above the ground-floor, which is built of best hard buff Darley Dale stone, the front is executed in very thin brownish-red Coalville bricks, with white mortar joints, except the moulded and carved portions, which are in bright red rubbers, and the pediment copings and similarly exposed parts, which are of red Mansfield stone. The portion of the front—the tower—constituting the house, has the regulation 18th-century panes of crown glass, the windows falling in the gable of the Hall proper being all glazed with antique glass in leads. The roofs are covered with brown Broseley tiles. In the carved capitals of the five stone pillars which carry the front on the ground-story are to be read the names of Socrates, Jesus, François Michel Arouet de Voltaire, Thomas Paine, and Robert Owen, and in corresponding niches just above occur busts in red terra-cotta of these worthies, while bronze belts round the pillars will be inscribed with quotations from their utterances. The accommodation comprises the following:—On the first floor, the lecture-room; on the ground-floor, the general club-room, 66ft. long and 22ft. wide, with bar, committee-room, and Freethought book-shop; on the basement-floor there is a large room, about 55ft. by 22ft., paved with a peculiar hard, light-coloured concrete, suitable for bowling, billiards, or other purposes. The architect was Mr. W. Larner Sugden, of Leek; Mr. William Bailey performed the duties of clerk of the works.

SCHOOLS OF ART.

Nottingham.—The annual distribution of prizes to the students in this school was made by Lord Sherbrooke on Wednesday week, when reference was made, by most of the speakers, to the change of head masters which had recently taken place, Mr. J. S. Rawle having left to occupy a similar position at the West London School of Art, and having been succeeded by Mr. Dalgleish. Silver medals were awarded to W. H. Wightman, Gilbert S. Doughty, Thos. Dutton, A. Middleton, J. Clews, Lucy A. Leavers, Arthur Marshall, H. G. Smith, A. W. Brewill, G. G. Simpson, W. R. Walton, J. Farnsworth, Ada Fussey, M. H. Goodyer, W. Hardy, T. Meldrum, J. Simons, F. C. Vessey, H. Williamson, and J. W. Wood; the mayor's silver medal was taken by Jas. C. Butler; 109 third grade medal prizes, and 115 second grade prizes, besides many certificates, were also awarded.

Bromley, Kent.—The annual meeting in connection with this school took place on Friday. The report showed that the number of students who attended last year was 113, showing an increase of 38 on the previous year. 41 students had sent 126 works to the annual examination at South Kensington; but they had not been successful in obtaining a single third grade prize; 36 second grade certificates had been gained by the 50 students who competed.

More than Fifty Thousand Replies and Letters on subjects of Universal Interest have appeared during the last ten years in the ENGLISH MECHANIC AND WORLD OF SCIENCE, most of them from the pens of the leading Scientific and Technical Authorities of the day. Thousands of original articles and scientific papers, and countless receipts and wrinkles embracing almost every subject on which it is possible to desire information have also appeared during the same period The earliest and most accurate information respecting all new scientific discoveries and mechanical inventions is to be found in its pages, and its large circulation render its the best medium for all advertisers who wish their announcements to be brought under the notice of manufacturers, mechanics, scientific workers, and amateurs. Price Twopence, of all booksellers and newsvendors. Post free 2½d. Office: 31, Tavistock street, Covent-garden W.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.
(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. R. M. Tuttle, of 13 and 15, Laight-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Cases for binding the half-yearly volumes, 2s. each.

NOW READY,

Handsomely bound in cloth, Vol. XXXIX. of the Building News. Price Twelve Shillings. Order at once, as only a limited number are bound up.

N.B.—Cases and vols. must be ordered through a bookseller or newsagent, as the regulations of the Post-office prevent them from being sent by post.

Received.—McC. and Sons.—H. and Co.—F. M. and Co.—H. J. B.—W. G. S.—H. M. C.—J. S. and Co.—J. C. E.—H. C. and Co.

Correspondence.

THE SUPERVISORS OF METROPOLITAN BUILDINGS.

To the Editor of the Building News.

Sir,—Permit me to thank you for the insertion of my letter on this subject. The reply from the writer of the article considerably modifies the charges first made. But I must still demur to his qualified statements:—

1. From the frequent proceedings that I have taken under the Building Act and other causes, I have been brought in close contact at various times with every district surveyor in the Metropolis, and though it is satisfactory to learn that the writer only intended to refer to some half-dozen district surveyors when he spoke of their "narrow capacity, culture, and ability"; yet I venture to assert that he is not justified even in this statement. There are, by the Directory, over 900 architects and building surveyors practising in the Metropolis, and I assert that for knowledge of building construction and the special ability required in the position, district surveyors are far beyond the average of the general practising London architects. My proofs of this are the following:—In my own district office I have records of some 40 cases where architects have attempted to carry out construction, which was not only illegal, but absolutely dangerous. I have also a large collection of photographs of failures where architects have been employed, and which I shall be happy to show your correspondent. I have been engaged in professionally investigating most of the building casualties which have occurred during the last six years in London, and in nearly all of these, architects have been engaged. Most of the district surveyors have carried out large works on their own account; but there is no instance on record where any practising district surveyor has had a serious accident occur to works under his own control. I have frequently heard architects in law-courts give such evidence as the following:—That it is possible to form an opinion as to the safety of an old party-wall by looking at it only on one side, or without examining the base or foundation! I have heard them swear that bricks, copings, and chimney-pots falling from roofs would not be likely to hurt people! That brickwork three courses to the foot with 1¼in. mortar joints was sound work! That insufficient cast iron was not dangerous till actually cracked and falling! I assert that no district surveyor would be guilty of these acts or words, and I retort the charge of "narrow culture," &c.).

2. I am glad the writer says he does not insinuate that district surveyors wink at the doings of speculative builders; but he thinks the system tends to make them do so. I care far more for facts than tendencies, and the facts I gave in my last letter prove they do not. But, more than this, I assert that district surveyors have strained the law as far as they can to stop speculating builders' rascality; the Building Act was originally intended simply to prevent the spread of fire, and till last year there was nothing in it to touch insufficient and bad materials, and even now the only way to stop scamping buildings in this respect is to report the work, when so done, as dangerous and get a magistrate to condemn it; the Act as regards dangerous structures was never originally intended to be worked for this purpose. I was myself the first to apply it in this way, and the fact that the other district surveyors have followed my example till the dangerous structure cases have quadrupled, proves that whatever the tendencies Act may be, the facts are against the author's conclusions.

The writer says I am opposed to reform; here he is also mistaken. The strenuous attempts that I have made for the reform of the working of the Building Acts is a matter of notoriety throughout the profession, and it is well known that for two years I spent the whole of my district income in this manner: and, having never yet summoned a builder for a fee, I have a right to be heard on this subject. The case mentioned by the writer where he was informed a builder had paid an excess fee is a remarkably weak one, even on the face of it; he says "the builder informed him." If the writer assumes his facts on information supplied by builders against district surveyors, no one will be surprised at any views he may adopt. Would he take the opinions of wolves on the character of sheep-dogs?

He asks, What check is there on district surveyors? It so happens there is a very efficient one. The Metropolitan Board of Works comprises 48 members; these gentlemen represent 56 parishes, which have an aggregate of over 3,000 vestrymen. District surveyors are compelled to give a receipt on an official form for every fee they take, giving the squares of the buildings and full particulars; and any builder or other person who thinks he has paid an excess fee has only to mention it to a vestryman of his parish, who can bring it at the next meeting before his representative at the Board of Works, and the matter is at once investigated. This kind of case is continually occurring, and almost invariably it is found that the district surveyor is right, and I challenge the writer to produce even five cases during the last year where throughout the whole Metropolis any district surveyor has charged an excess fee, and if he will give me the facts I will myself investigate the cases (in confidence) and bring them before the Committee of the District Surveyors' Association and the Board of Works. Under the present Building Act it is impossible to pay district surveyors by salary; some districts are not worth £100 per annum, and several not £200. The writer says public roads are surveyed at the public expense, why not public buildings? He seems to be unaware that theatres, lecture-halls, &c., are private property, that district surveyors' principal duties are to survey private, not public, buildings; and I imagine that till the writer gets the law altered

so that fees for private scaffolds and hoardings, court fees for lawsuits, and similar matters, are paid by the public, he will not get the cost of supervising private buildings defrayed at the public expense. As regards the next subject, viz., appeals to the Metropolitan Board of Works from the district surveyor's decision, the writer's last shot at me falls harmless. I have probably in the neighbourhood of Charing Cross more cases of public buildings to deal with than any other district surveyor in London; and though I have had to meet many leading architects in these cases in no instance has my decision been appealed against; the only case when my name has been before the Board being when I reported the iron-work for a certain building dangerous, and the Board, with their usual courtesy, helped the architect out of his difficulty by referring the matter to their engineer, who showed him how to tie up the building.

In my last letter I purposely abstained from saying anything with reference to the insinuation that district surveyors in their official transactions fail to conduct themselves as "gentlemen dealing with gentlemen." District surveyors have often a delicate task to carry out in informing other architects that their plans are contrary to the law, or that their client's buildings are dangerous, and it is not to be wondered at that occasionally ill feeling or some display of temper is evoked; but I assert that, as a rule, district surveyors soon become, from the frequency of these cases, a remarkably even tempered and considerate set of men; and they are no more annoyed at these little displays of temper than a surgeon is at the fractiousness of a patient under an operation.

Under the Building Act district surveyors are compelled to meet no one but the builders actually doing the works, and they have no responsibility till they have certified their completion "to the best of their knowledge and belief" under the Act; but all of us, as a matter of courtesy, are in the habit of continually meeting architects and arranging matters with them beforehand, in order to save their clients delay and expense; but is it fair in return for receiving this consideration at our hands, to demand it as a right and bring a charge of discourtesy against us when differences occur? In my own practice I have made it an invariable rule, whenever any question arises and I find that an architect is employed, to write him at once, and in almost all cases this courtesy is gratefully received and generously reciprocated; but I have met with some strange instances to the contrary. One surveyor, upon my proceeding to inspect a dangerous structure by the order of the Board, seized a sledge-hammer and threatened to dash out my brains if I ascended a ladder to do so. I obtained the assistance of the police, who removed him from the building. Another architect, while discussing a question as to the strength of iron-work, upon my differing with him, suddenly stigmatised me as a scoundrel. I have been informed more than once that I should some evening be knocked down in Leicester-square; certain members of my own profession have frequently described me as mad, crazy on dangerous structures, and fool to my own interest, &c. But none of these things have moved me, as I fully expected that any fair attempt to promote the enforcement of the law for the safety of buildings would evoke this opposition; but the result in my case has proved that I was right, as in every instance I have succeeded. Magistrates, at first indisposed to convict, have become convinced by the inexorable logic of facts, and from the numerous building casualties which have occurred; and though the greatest difficulty I have had to meet with has been the opposition of incompetent so-called architects, as ignorant of building law as they are of construction, yet I am pleased to find that every day I receive fresh proofs of the gratitude and confidence of the residents and householders in my districts.

The thanks of the district surveyors are eminently due to the Building News for its efforts to put down bad building; but if one district surveyor has been guilty of practices that reflect any discredit on himself or his colleagues, we have a right to demand that facts and names be published, or at least sent to the Committee of the District Surveyors' Association, where they will be properly investigated; but after the determined effort that has been lately made on our part to stop bad and unsafe building, as well as reform the law, it is, I submit, too late to make general charges against even one member of our body without following them up and proving them to be either false or true. The true blot in the working of the Building Act, is that magistrates will not enforce adequate penalties on builders; and till this is done the law is practically powerless. I intend shortly to bring before the public glaring instances in proof of this statement.—I am, &c.,

Robert Walker, F.R.I.B.A.,
District Surveyor of St. Martin's-in-the-Fields, and St. Anne, Soho.

21, King William-street, Strand.

THE INSTITUTE AND ITS PAPERS.

Sir,—The leading article in your issue of the 18th ult., touched, I am sure, a chord of sympathy in every member of the Institute.

Assuming that the papers read at its meetings would be considered by visitors and outsiders as some approach to the measure of the capacity of the Institute as a body, it may not be out of place to review the repast which we have had served up at the intellectual banquets of the present session. The "Menu," as sketched in the Opening Address by the President, seemed to prospect freshness; he reduced the number of courses, but promised that the food should be more substantial, and hoped that the three stewards would supervise "fearlessly" the duty imposed on them; and what have we had? Too much soup, very little fish, plenty of made dishes of the usual doubtful character, but a positive absence of real cuts from the saddle and sirloin.

The first paper read, "The Modern Barrack," by Mr. Ingress Bell, was a good honest meal, and all went away satisfied. The second paper, "Sanitary Science," by Mr. E. C. Robins, was, on the contrary, unsatisfactory. As a discourse before what we are bound to consider a body of practical working architects, it might, I think, be considered obtrusive. I listened, and have read, in vain to find in it anything which is not practised by every architect of the day who knows his business. I admit that the paper was carefully prepared, and for its painstaking character deserved the warm thanks of the members; but at the Institute, if we may accept Lord Palmerston's definition, it was *dirt*, simply "matter in the wrong place." Before amateurs, or students in architecture, it would have been appropriate, but before *architects* it lost its *raison d'être*. I am afraid, however, that this might be said of more papers than Mr. Robins', and it is rather to the *discussion* on his paper that the annoyance experienced by many members may be attributed. We have had specialists, professors, and others occupying two whole evenings in lecturing architects on the preliminaries of their sanitary education. Academical discourses and theoretical froth have been allowed to proceed until, I daresay, the rooms of the Institute are now regarded by many as an appropriate place wherein to air spurts of eloquence, and to obtain cheap lessons in elocution, with the additional advantage of seeing it all in nice large type in the *Transactions*, and faithfully epitonised in the professional journals.

Fellows of the Institute, at times, delivered themselves of sound matter. I think, though, that if Mr. Dawson would consider the laws of moving water, or the conditions under which water in slow motion deposits matter in suspension, and with increased velocity removes it, he would alter his opinion as regards the diameters of house-drains, and would arrive at the conclusion that architects are in the habit of specifying diameters far too large for the purpose. Mr. William White, F.S.A., however, was positively amusing in the following narrative:—One evening, when the curtain in his sitting-room was unhooked, and he was suffering seriously from the gaslights, on getting up to the ceiling he was struck with the immense heat it to which he was putting his head.

Now, Sir, that is the sort of information we want. I daresay most of his hearers would look to the floor-line for the heat from gas-lights near the ceiling; but now we all know that it is not so. Thanks!

Who is responsible for all this waste of time? Is it the secretary, or the three stewards? One could have understood such things during the last *régime;* but when the well-known skill and accomplishments of the present secretary were imported, it was thought that his motto would be "Nous avons changé tout cela." But, during the discussion I have referred to, there he sat like a lamb, a *white* lamb in fact, and one could not help wishing that some gentle shepherd would, with his crook, give him the gentlest lift under the tail, so that he, or the President, or someone might *name* every man as he rose, and so close the discussion. Or, where was the librarian? He ought to have been at hand to say that Mr. Robins' paper, and all the discussion arising out of it, would be quite unnecessary, as there was nothing in any of it except on warming and ventilation, which is not to be found in S. Stevens Hellyer's book, "Dulce Domum."

The third paper on the "Remains of Roman Buildings at Brading, Isle of Wight," by Messrs. Price, was, so far, very interesting to architects, but more so to the antiquary. That, however, was balanced by the unique array of feminine beauty, which occupied "the front row of benches."

On the fourth paper on "Persian Architecture and Construction," by Mr. C. Purdon Clarke and Professor Lewis, I will not offer any comment. I repeat, however, for this occasion, my observation respecting the "front row of benches."

We have thus had four out of the six, or, at the outside, eight papers promised by the President, and what have we gathered? What could we have gathered? These are questions which I leave to be answered by those responsible for the papers, and will only add that if really practical and sound papers are not forthcoming, I do not see that the meetings need take place at all. Shut up the shop! If you cannot give us a good dinner, don't invite us, or the result will be that if you continue to give bad dinners, the invited will stay away, and then when there is a good meal there will be nobody to partake of it.

Let us have pure meat, and less soup and pudding; in fact, more of the sort of repast which Mr. Roger Smith's paper last night, and the discussion which followed, gave us.—I am, &c.,

Wm. Woodward.

THICKNESS OF ARCHES.

Sir,—In the last edition of the "Encyclopædia Britannica," art. "Bridges," Prof. Fleeming Jenkin, the writer of the article, quotes a well-known empirical formula for the thickness of the crowns of arches, with which he credits Mr. Trautwine as the originator, but on what authority he does not state. The formula in question, which is of the form $D = C\sqrt{r}$, was suggested by me, and adopted in my own practice as early as 1850, and communicated to the Building News, in which it appeared on the 27th Feb., 1857. I have some recollection of Mr. Trautwine and another gentleman claiming the formula in letters to the *Civil Engineers and Architects' Journal*, about the year 1861, neither of whom I believe claimed to have thought of it more than two years previously, I wrote to the *C. E. & A. Journal* on the subject at the time; but from some cause or another, my letter did not appear, and the matter dropped. Mr. Trautwine is the author of a very excellent "Engineer's Pocket Book," in which he gives a formula for the thickness of arches, but it differs much from that quoted by Prof. Jenkin.—I am, &c.

J. T. Hurst.

BUILDING STONES.

Sir,—Perhaps you will allow me to assure your correspondents on this subject in your last issue, that I did not—nor was it my object to—disparage granite or any other stone. I stated that a high specific gravity was no guarantee of the durability of a building stone, and I mentioned a proof which came to hand. I might have given many other proofs of my argument; one more will be sufficient now. At Wells Cathedral, the abaci of the caps of the columns were generally of dense blue-lias. This was all gone to decay, and had to be replaced at the recent restoration by other material, while the lighter oolite remains in perfect preservation.—I am, &c.

Charles Trask.

RE BOARD SCHOOLS—ORPINGTON COMPETITION.

Sir,—In October of last year the above School Board, through their clerk, Mr. Robert Gordon Mullen, advertised in your valuable journal for designs for additions and alterations to the

British Schools, Orpington, and also for the erection of a school house.

Can you, or any of the readers of the Building News, through this medium, inform the public, including the competitors, what has been done in this matter by the committee? One would have thought the Board would have acquainted the competitors the result of their labours.

The following is a copy of a letter accompanying the returned designs:—

Local Offices, Bromley, Kent, 19th January, 1881.

BOARD SCHOOLS, ORPINGTON, COMPETITION.

Sir,—The Board having made their selection, I return your designs herewith. Thanking you for competing,

I am, Sir, Yours faithfully,
(Signed) Robert Gordon Mullen.

Is it not reasonable that the competitors should know to whom the honour has fallen, and is it not usual to acquaint them?—I am, &c.,

One Interested.

SOCIETY OF MERCHANT VENTURERS' TRADE SCHOOL, BRISTOL.

Sir,—The inclosed letter will be interesting to many of your readers, as showing one of the worst results to the profession of the competition system.

This is the competition in which the Press was excluded from reviewing the designs.—We are, &c., Bevis and Hill.

Gloucester Chambers, Kings-road, Southsea, and at Fareham. March 1.

Merchants' Hall, 25th February, 1881.

S. M. V. TRADE SCHOOL COMPETITION.

Dear Sir,—I beg to advise you that I have this day returned to your address, carriage paid, the designs you sent in for the proposed new trade school.

I take the opportunity of informing you that, while the Society have offered to purchase for £100 the set of designs which they are advised is the best of those sent in, none of the designs are satisfactory, and no one of them will be carried out.

I am, dear Sir, yours faithfully,
(Signed) George H. Pope,
Treasurer, S. M. V.

Messrs. Bevis and Hill, Architects, Kings-road, Southsea.

WHOSE PLAN IS IT?

Sir,—In the Building News of to-day is published "a design for a concrete house for Mr. Lascelles, designed by Ernest Newton, architect." The *plan* given in the corner of the lithograph ought, however, to have been acknowledged as Mr. R. Norman Shaw's. See the Building News for May 31, 1872, page 448.—I am, &c., E. W. Godwin.

St. Stephen's Palace Chambers, Westminster, S.W., Feb. 25.

Other correspondents have written pointing out the same thing. We caused a communication to be made to Mr. Newton, who replied as follows:—"My explanation of the matter is very simple. Mr. W. H. Lascelles applied some time ago to Mr. Shaw to design him some houses to be built in concrete on his own method. Mr. Shaw being at the time very busy, handed the work over to me, at the same time giving me permission to use any of his drawings I might wish to use in giving Mr. Lascelles the sketches. This one that you published last week had a plan similar in nearly every respect to the house mentioned. The elevation was considerably varied, as far as I can recollect. When you proposed to publish it I asked and obtained Mr. Shaw's permission, he stipulating only that his name should not appear."—Ed.

THE LATE FIRE AT MESSRS. J. AND J. GREENWOOD'S.

Sir,—So much has been written and spoken of late in reference to the lack of good feeling and sympathy existing between employers and employed, that a noble exception cannot be too widely made known.

At the above fire all the joiners' tools were destroyed. As soon as the amount of each man's loss was ascertained, Messrs. J. and J. Greenwood presented to each uninsured workman seven shillings and sixpence in the pound; to each insured workman two shillings and sixpence in the pound, and made good the apprentices' loss in full.

As the generous sympathy thus displayed is unprecedented in the Building Trade, we hope its publicity will lead other employers to act as nobly when their workmen may be placed in like circumstances.—We are, &c.,

Employes of J. and J. Greenwood.

"FROZEN WATER SUPPLY AND KITCHEN-BOILER EXPLOSIONS."

Sir,—I am glad to see Mr. J. M. Gething, as an architect, taking an interest in this subject, and beg to thank him for his kind intention to enlighten us upon it. I fear, however, that he has been rather hasty in sending off his letter, and without understanding the real bearing of his remarks.

In regard to my diagram, Fig. 1, page 192, he says:—"There is very little, if any, use in Mr. Buchan's hot-water cylinder M." Now, it is a great mistake to say so, because, with a small boiler especially—as, *e.g.*, for a close range—and a strong fire, it is this hot cylinder, and not the hot-water cistern, that affords the safety; because the hot cistern may be emptied, and then, without the cylinder, the small boiler may be boiled dry, and become red-hot in a short time; and, if the cold water comes on again in these circumstances, an explosion takes place, and perhaps one or more persons are killed. I trust, therefore, that, with this explanation, Mr. Gething will both see and acknowledge his error promptly.

If Mr. Gething will look again at Fig. 1, p. 192, he will perceive that a complete warm circulation is maintained between the hot cistern B and the boiler N, by means of the down and up-pipes D and F. And so long as these are circulating properly and a fire on, there is no danger of the boiler-supply freezing, even although the branch pipes led off the up-cast pipe F were frozen. It is quite customary to make a "dead branch" of the hot pipe to the scullery sink, the length of which may perhaps be only 5ft., or it may be 20ft., even although provision is made to have hot water at once when a hot crane is opened at either a bath or basin, a small extra circulating pipe being put in to produce that effect, but as I showed no bath, &c., on page 192, I considered it unnecessary to complicate the drawing by showing said extra pipe, as it is not really necessary in connection with my subject on the solution of the problem on page 192, although said extra pipe, when put in, is an improvement. However, if it is wished, I am quite ready to supplement my drawing on page 192, but not to correct it. I leave the latter for Mr. Gething to do, if he is able, by a drawing of his own.

Although it sounds well in theory and at the first blush for Mr. Gething to say that if a cock is left trickling it should be a cold one, and not a hot one, because "waste of hot water means loss of heat"; he forgets that the warm-water from this hot-cock trickling slowly is utilised in preventing the waste-pipe from freezing, and also that as there may be an extra strong fire on during a severe frost, this trickling at the hot crane may be of use in preventing the hot-water from boiling, to prevent or stop which in some houses a large quantity of the hot-water has sometimes to be specially run off, particularly while cooking, so that all Mr. Gething's architectural objections to the plan, Fig. 1, page 192, are either mistakes or theoretical fancies, which won't stand a moment's practical criticism from a plumber who is acquainted with the subject.

I may add, in concluding, that I have the system shown in Fig. 1, page 192, in operation, and it worked well during the late severe frost in a large house which lately got a close range and small boiler put in, in place of the former open fire and large boiler. To the credit of the ironmonger, it should be mentioned that he refused to fit in the small boiler unless a circulating tank was put in, and when I was appealed to if the expense was necessary, I backed up the ironmonger, who was a stranger to me, for the reasons I have stated above as to the cistern being emptied.—I am, &c.

W. P. Buchan, S.E.

Glasgow, February 26th.

EXTERNAL SOIL-PIPES.

Sir,—Considering the very great acknowledged importance of a correct conclusion on this matter, it is a pity that Mr. Buchan gives merely reiterated statement and assertion, instead of explanation or reason why "the sewage-polluted air, blown off into the atmosphere from an inside soil-pipe, is several times greater in quantity, and also worse in quality, than the sewage-air from an outside soil-pipe." Mr. Buchan must have credit for seeing it, and believing it to be so; but he will be doing a much more substantial service to the cause of drain-ventilation and sanitary science, if he will in some way formulate his proposition in reference to the pace of current, quantity of air, and change of temperature in a given lengthened size of pipe. It is, I believe, generally admitted, but I am of course open to correction, that in a soil-pipe disconnected from the sewer, foul air will be generated only from one or both of two causes, namely, foul matter deposited in the pipe or drain, and stagnation of air. My proposition supposes the pipe, whether external or internal, to be sound and free from deposit; and I argue that the more rapid the draught up the pipe, the less danger of the generation of foul air. If this argument is unsound, I hope it will be shown wherein it is unsound, and not merely denied. Far be it from me to deny that Mr. Buchan is quite correct; but I do deny that he has supported his proposition by an valid arguments. True, he says that bad gas is given off by the greater heat. But, in order to make this practically applicable to the question, it is necessary for him to show how many degrees he finds the external temperature to be *raised* in its passage through an interior pipe, *more* than in an exterior pipe; and what would be amount of difference in temperature, and the length of time, necessary to induce the decomposition, which he alleges to take place; and, further, what would be the amount of increased evaporation taking place, which is said to make the increased draught up the soil-pipe more dangerous than the torpid state which he advocates.

Another point deserving of consideration is that the ventilation of an interior soil-pipe is much more likely to be regular and constant in its action, from the very fact of its more equable temperature, notwithstanding the changes which may take place outside; whilst an exterior pipe exposed to the heat of the summer's sun, and to the winter's frost, will unquestionably be liable to sudden and frequent changes in its action, in a manner most undesirable.

The question of outside or inside soil-pipes has been, and still is, very much controverted. Mr. Buchan's knowledge and experience may enable him to settle it to his own satisfaction in very few words. But a question of this sort is not so easily to be determined "off-hand," if it is to carry conviction to those who have grave doubts as to its solution, and who will not rest content with the mere *ipse dixit* even of a scientific man.—I am, &c.,

William White, F.S.A.

30A, Wimpole-street, 1st March, 1881.

Sir,—In a house I have recently altered, here, there are w.c.'s at the back and one in the front of the house.

The soil-pipe of the back w.c.'s I carried above the ridge of roof, because I wished this pipe to serve as the outlet for foul air. The top of the soil-pipe in the front I allowed to be considerably lower than the ridge of roof, because I intend this one for the admission of fresh air, and so to create a constant current in the soil-pipes and drain.

We know the effect of not carrying chimneys above the ridge of roof. But the position of the soil-pipe with regard to the roof does not appear to me to be often considered. The other day I saw one of Banner's cowls which was placed below the ridge, spinning about like a top, while one on the same house carried above the ridge was answering perfectly to the wind.

I may mention that the soil-pipe which I have used for the admission of fresh air is outside the house, and the other one inside.—I am, &c.,

Charles F. Moxon.

Beach Cliff, Westgate-on-Sea, Feb. 22.

ILLICIT COMMISSIONS.

Sir,—A company is now being started for the manufacture of bricks and tiles. To obtain shareholders, prospectuses are being issued to various individuals, and amongst others to architects.

A leaf, of bluish-grey colour, has been inclosed therewith, and sent, as I suppose, to professional gentlemen only; in it occurs this paragraph: "It is proposed to allow the profession, who are holders of ten shares and upwards, a discount of 10 per cent. on goods required through their agency."

As this would amount to from 1½ to 2½ per cent. on the cost of a building, and is the commission given for bricks and tiles only, the public may easily imagine how an architect can work for a client at 2½ or 3½ per cent., and yet be better paid than the more conscientious one, who will have at least 5 per cent. from his client; but, on the other hand, will accept no other commissions except those paid by the client.—I am, &c.,

Hugh McLachlan.

South Kensington, March 2.

The members of the court of the Founders' Company have awarded their freedom and livery, with a prize of ten guineas, to Mr. Hugh Stannus, A.R.I.B.A., of 118, Kennington Park-road, for his essay on "The History and Art of Foundry in Brass, Copper, and Bronze." The essays generally are reported to have given great satisfaction to the judges, and a second prize of five guineas has been awarded to Mr. Edward Tuck, of the Chauntry Works, Sheffield.

At the Carlisle Consistory Court, last week, plans were approved for the rebuilding of St. Nicholas parish-church, Whitehaven, on its present site, incorporating into the new and larger building some portions of the existing tower. The new church is to be built from plans by Mr. C. J. Ferguson, architect, of Carlisle, and will be seated for 1,000 people; the cost is estimated at £8,700, which will be met by a lady, as a memorial.

Intercommunication.

QUESTIONS.

[6414.] — **Trigonometry.** — Could some practical reader kindly recommend a good book on the application of trigonometry to land-surveying; also one of mathematical tables, the publishers, and price, and oblige?—Kanyaka.

[6415.] — **Centrolinead.**—Will any reader kindly inform me the way to use a centrolinead? I have a perspective to make of a house, and wish to be 200ft. away. The angles I intend using are 60° and 30°. What I wish to know is how to apply the centrolinead, and whether the vanishing-points are necessary to work it. I know the principles of perspective. If some one will kindly set me right I shall be much obliged.—One in a Fix.

[6416.]—**Value of Architect's Practice.**—Will someone inform me upon what basis the value of an old-established practice of an architect is ascertained?—A. T.

[6417.]—**Pebble Dashing.**—Could anyone inform me where the small pebbles, used for "pebble-dashing" the exterior walls of buildings, can be obtained, and the approximate cost of same per ton? Also, how many yards will a ton cover, and, if possible, to explain the *modus operandi* of "pebble-dashing" on a surface of Portland cement?—Lancashire.

[6418.]—**Smoke Cure.**—Houses are being built at foot of hill, and client fears smoke. He suggests carrying pipe from external wall to back of register, and about 3ft. up. Which is more probable, that pipe will act as exhaust of high-pressure engine, and drive smoke up flue, or that admission of air into flue will weaken draught at register? Client's idea is to prevent smoke at bottom of flue rather than at top. Suggestions will be welcome. If above pipe adopted, what size should it be? Flue, 14in. by 9in.—J. T.

[6419.]—**School-Boards and their Architects.**—Are school-boards obliged to employ a professional man to prepare requisite drawings and specifications, and superintend the erection of new schools; or does the department witness and sanction the employment of amateurs? I have a case now under my notice in which a novice has offered his services, and is preparing the above-named particulars.—H. W. L.

[6420.]—**Maintenance of Roadway.**—Will any experienced reader inform me whether there is any saving practically to the ratepayers in maintaining a public roadway from the fact that the central part is kept up by a tramway company, the sides only being made up from time to time as may be necessary by the parish. We were told that if the tramway were laid in our district that a saving would result to the ratepapers for the above reason. I questioned if there would be any saving, but should be glad of anyone will furnish a few facts from experience.—A Man in the Suburbs.

[6421.]—**Builder's Claim for Increased Depth in Foundations.**—A builder tenders for erection of a block of six cottages, plans and sections being given for only two, showing depth of foundation 2ft. 6in., but no instructions given on plans, sections, or in specification, that the ground sloped both laterally and longitudinally. Tender was accepted and work proceeded with, the foundations being brought up to the same level throughout, occasioning (owing to the falls of the ground) an average of 5ft., instead of 2ft. 6in. as tendered for. Can the builder claim for the increased excavation and brickwork? Surveyor lowered level of last two cottages in block, and increased thickness of wall of end gable separating fourth and fifth house. Can the builder claim this and for the verge pointing and flashing of roof, where it abuts against the wall of the adjoining house?—W. B.

[6422.]—**S. K. Exam.**—Would some of your able contributors kindly inform me what are the general questions put to students in the examination of architectural styles under the Department, and, also, what are the proper books to read up for the same!—Student.

REPLIES.

[6189.]—**Fifteenth-Century Dr. Tanners.**—Some little time ago (Aug. 13, 1880) passing allusion was made by me, in a reply to a query under the above heading, to a sculptured figure of a skeleton in Exeter Cathedral's choir, which some had ascribed as an effigy of Bishop Lacy. I expressed my firm conviction that this was an error, but I was not prepared at the time to say whom it did represent. I have just come across some information that seems to bear upon the figure in question in Richard Izacke's original edition of the "Antiquities of the City of Exeter," dated 1676. In page 93 it is recorded:—"In 1465 Bishop Courteney finished the north tower of his church" (*i.e.*, formed the Norman north-west tower of the original building into the north transept of the new Decorated one) "and freely bestowed the clock-bell therein bearing his Christian name, Peter, under which tower is an aisle. There purposely erected lies interred one William Sylke, some time sub-chaunter of this church, and reported to be the donor of the luminaries, or candle-lights yearly burnt in the quire of the said church between the feasts of Allhallowtide and Candlemas, an effigy of whose skeleton is there largely portrayed in white alabaster, under a fair arch, thus inscribed:—'Sum quod eris: fueramque quod es: pro me pro me precor ora.'" Mr. Sub-Chaunter Sylke's inscription does not seem to correspond with the existing inscription over the skeleton at the entrance to St. Andrew's Chapel in the north aisle of the choir, but otherwise the reference seems to fit in with him. The preface, if I may use the expression, on the title page of Izacke's "Antiquities," is delightfully pungent. It runs: "Books receive their doom according to the reader's capacity." The original MSS. of this work is still preserved amongst the city's records.—Harry Hems.

[6389.]—**Stained Wood.**—As a practical hand in such work, I would advise him not to attempt to get off dark stain by scraping or composition of any kind, as it would not only unfit the wood for any after-purpose, but cost endless labour in doing so. As he states "the church is too dark," I would suggest (and which is now much in vogue in all churches) to make a nice white distemper, with plenty of best ultramarine in same, and put this on open woodwork of ceiling. If this is properly done it will not only look sound and solid, but will add to the light of the church. I think if this was carried out correspondent would find he need not go to the expense of doing anything to the seats. Should he, however, still think the church too dark, and would like the seats altered in appearance, I would advise a nice drab in two party colours; but this also should be done by one well experienced in the making and using of colours; although looking simple enough to paint, it requires great care in the proper mixing of fitting material, and the working of same for such like furniture. I should be pleased to give correspondent any further information, or would carry out the said work myself for him should he think fit to advertise his address and requirements.—Church Decorator.

[6394.]—**Entasis of Greek Column.**—I should advise the axis, height, and upper and lower diameters of column, to be set out full size on a floor of good working area. From bottom of column or shaft draw a line indefinitely perpendicular to the axis of column, and from the extreme point of the upper diameter as centre, with radius equal to the lower semi-diameter, strike an arc cutting the exis in a point. Through the latter and extreme point of upper diameter then draw an oblique line, cutting the horizontal line produced, and this intersection will give the centre of any convenient number of ordinates or rays, which may be drawn through axis of column. Upon these several rays the semi-diameter of the bottom of column is set off from the axis, and the points so found will be in the curve required, which may be drawn either with a straight or flexible ruler. There is a sort of trammel that may be used for the same purpose.—G. H. G.

[6398.]—**Workhouse Plans.**—I do not think "Fair-play" has a claim legally, inasmuch as the guardians said nothing in advertisement about compliance with the requirements of the Local Government Board. The case is certainly a flagrant one, and the guardians deserve exposure for selecting a plan which has been so altered by the Local Government Board as to be scarcely recognised again, and in rejecting one which appears to have come so near to the requirements of the Board. If the particulars furnished to the competitors gave them to understand that the approval of the Board was necessary, there might possibly be a case against the guardians, which would, however, be hardly worth trying.—G. H. G.

[6402.]—**Quantity of Stone in Spire.**—"Novice" would probably have but an imperfect idea of what to allow for waste in the angle stones and plain ashlar of spire, and had better leave it to intending contractors to make their own allowance, with a statement to that effect in the bill. The margin to be allowed for waste will vary very much, according to the kind of stone used. If in Bath stone or other soft oolite, the angle stones would be sawn one out of the other, and the ashlar would be cut to the rake, whereas in the North of England or other grit-stone locality, a square stone large enough to make each separate angle stone would have to be provided for, for even if moulds were sent to quarries to have stones roughly scappled to shape, to save carriage, the square stone would be charged for. Moreover, I should not give it in cube feet at all, but give the number of superficial feet measured over all, taking each thickness as a separate item, as 8in., 6in., and 4in., and giving the height of each from ground for hoisting, then state, "To extra stone and labour, to angle of spire," in lin. feet, and for the solid portion at top measure the courses separately as square stones, also noting this in the bill. As a practical mason, I should take it in this way.—S. B. B.

[6403.]—**Builders' Accounts.**—It is far more satisfactory to bill extras and deductions in full.—F.

[6403.]—**Builders' Accounts.**—The 20 yards only is an extra, the 70 yards being in contract, and not needing to be considered. There is no deduction, and therefore the seventy yards cannot appear in that column, and there cannot be any reason for so doing, except that the surveyor is to be paid by percentage on the extras and deductions.—S. B. B.

[6406.]—**Felting a Roof.**—Yes.—F.

[6407.]—**Cubing a Building.**—Take from the bottom of the footings to half-way up the roof.—F.

[6407.]—**Cubing a Building.**—The whole of the buildings from bottom of foundation to, say, half-way up roofs, should be measured. Also all dormers, bays, and projections. Solids, such as chimney stacks, should be estimated separately.—B.

[6409.]—**Milled Lead.**—Most certainly, 4½lb. lead cannot honestly be substituted for 5lb. It is not any way to the point to say that it would do as well. The plumber pays for his lead by weight, and also charges for it by weight. Half a pound gained in each super foot is a matter too serious to overlook. Let the contractor see that you are not to be taken in in this case, and you will escape imposition at his hands for the future.—B.

[6409.]—**Milled Lead.**—4½lb. lead is manufactured purposely. If 5lb. lead is specified, "see that you get it."—F.

[6410.]—**Clerk of Works.**—Neither; the accounts should be prepared by a competent surveyor.—F.

[6412.]—**Charges for Abandoned Plans.**—Charge a nominal amount sufficient to cover time, office expenses, &c.—F.

[6413.]—**Green Slates.**—Nantle Vale.—P.

A select committee of the House of Commons, on Tuesday morning, passed the preambles of two Bills promoted by the Metropolitan Railway Company, the principal one being one to enable the company to make an immediate extension of their system from Aldgate to Tower-hill, as an instalment of the completion of the Inner Circle Railway; the other Bill is to authorise them to make agreements with the Corporation of London and other bodies, for the purpose of completing the City extensions.

LEGAL INTELLIGENCE.

Modern Housebuilding.—At the Edmonton Petty Sessions on Friday, R. Radley, builder, of 2, Newton-road, Page-green, Tottenham, was charged upon five summonses with violating the by-law of the Tottenham Local Board of Health which provides that "the external and party or side walls of every new building constructed of brick, stone, or other hard substances shall be efficiently and solidly bonded and put together with mortar or cement, and the bricks, stone, and timber used in every new building shall be substantial and sufficient; and for the purpose of securing stability to new buildings, the mortar, cement, bricks, and timber used, or intended to be used therein, shall be subject to the approval of the Local Board." Mr. W. A. H. de Pape, surveyor to the Board, deposed that in September, 1879, the defendant deposited plans for the erection of five houses in Newton-road. The plans were approved, subject to compliance with the by-laws. Witness visited the buildings on the 17th ult., and found a very improper substance being used as mortar. It was composed of screened lime from old buildings, mould, and a very small portion of lime. Samples were placed before the magistrates and carefully examined by them. The material fell into pieces upon being slightly pressed between the fingers. Mr. de Pape said the principal ingredient was ordinary mould. That same stuff had been used in all the five houses. The plaster upon the walls was composed of mould and screened rubbish from old buildings. The party and internal walls had been constructed nearly altogether of brickbats, but the facing was good. Walls so constructed were not safe. In some of these houses the party-walls were in a dangerous state. Proper timbers had not been used in the construction of the houses. The floor joists were bad; most of them were of old timber which ought not to have been used, but some of them might have passed if the workmanship had been at all decent. The houses were finished, but were not safe for human habitation, and ought to be pulled down. The matter would be reported to the board at their next meeting, and no doubt directions respecting the houses would be given. Mr. Abbiss said the infliction of a fine, even to the full amount allowed by law, did not meet the justice of such cases. Here were houses which would be positively dangerous for people to live in, and he thought the board ought to exercise what power they possessed in order to have the buildings pulled down. He had never seen such wretched samples of so-called mortar in his life. Did the defendant have notice not to use it? Mr. de Pape replied that notice not to use the materials in respect of two of the houses was sent to the defendant on the 28th of December, but he went on. Mr. Abbiss said the bench were determined to do all in their power to put a stop to this nefarious style of building, and required the defendant to pay the full penalty of £5 for each house, and a continuing penalty of 10s. per day for forty-four days in respect of the two concerning which notice had been given. The defendant was also ordered to pay 40s. for neglecting to carry a party wall of a new building to the required height under the by-law of the board devised for the prevention of fires. The total fines and costs amounted to £75 11s. 6d., and the bench ordered a month's imprisonment upon each summons in default of the money being paid or recovered upon distraint.

Back Money for Brickmaking.—Street v. Hudson and Baker.—In this case, heard at Bow County Court on Saturday, the plaintiff, Simon Street, a brickmoulder, of Barking-road, sought to recover from defendants the sum of £11 13s., being money retained by defendants on 466,000 bricks made by plaintiff for them. Defendants pleaded justification for retention, and set up a counter claim of £50 for bricks alleged to have been spoiled in making by the plaintiff. Mr. Willis, in opening the plaintiff's case, said his client was engaged for the brick season by the defendants to manufacture bricks, for which he was to be paid 5s. 6d. per 1,000, of which 6d. per 1,000 was to be retained by defendants till the end of the season, when they were to pay it over to plaintiff, providing he had not misconducted himself so as to warrant his being discharged. Should he, however, be discharged for any proper cause, the employers claimed the right to retain the money. Plaintiff remained in their service till September 3rd, when he was discharged on the ground that he had been idle all the previous week. It was then nearly the end of the season, and plaintiff and his gang had made 466,000 bricks. He applied for the back money on this number, but the defendants refused to pay it. The defence was that plaintiff did his work so badly that 50,000 bricks were entirely spoiled, and defendants submitted that under these circumstances they were entitled not only to keep the back money but also to be paid for the loss. The jury returned a verdict for the defendants, but disallowed their counter-claim.

Libel on a Lincoln Architect.—Last week a Sheriff's Court was held in the Castle of Lincoln,

before Mr. A. B. Burton, Acting Under-Sheriff, and a jury, to assess damages in an action for libel, in which Mr. Wm. Watkins, of the firm of Messrs. Watkins and Scorer, architects, of Lincoln, was the plaintiff, and Mr. Wm. Reeve, plumber, also of Lincoln, was the defendant.—The action was founded on a letter which the defendant had caused to be sent to the Rev. C. C. Ellison, Vicar of Bracebridge, Chairman of the Lincoln Board of Guardians, and Chairman of the Bracebridge Schools. This letter was sent to Mr. Ellison on the 2nd August last, and was signed "Miles's Boy." The letter ran as follows:—"Lincoln, 2nd August, 1880. Sir,—The architect who has done the Dispensary and Union in excessive charges for quantities of lythography has also done the Bracebridge School Board and yourself by charging 2½ per cent. for quantities of ten times the cost of lythography, the latter being done by the boy in his office; and he has charged you £10 for lythography."—Mr. Ellison at once forwarded the letter to Mr. Watkins, who had been the architect engaged in the erection of the Lincoln Dispensary, and also for the enlargement of the Lincoln Union Workhouse and the erection of the schools for the Bracebridge School Board, and was likewise employed personally by Mr. Ellison. Mr. Watkins succeeded in ascertaining that the letter in question had been written by Orlando Keyworth, a clerk in the office of Mr. Dale, solicitor, Lincoln, at the request of the defendant. The latter gave to Keyworth a letter to copy, and Keyworth stated that this letter was in the handwriting of Mr. Goddard, also an architect in Lincoln, and the defendant told Keyworth "he might guess again and be wrong." Proceedings were at once initiated, a writ being served upon the defendant; but he took no action to defend himself in the matter, and no communication was received from either him or his solicitors until the 12th of the present month, when a writ of inquiry had been issued.—The jury found for the plaintiff, damages £10.

The Midland Land and Investment Corporation (Limited) v. Peto.—This case was originally brought on at the last Warwick Assizes, and was further heard last week before Mr. Justice Denman, at Westminster. The action, it will be remembered, was brought to recover a sum of upwards of £14,000, alleged to have been paid to the defendant by the plaintiffs by mistake on behalf of one Godbold in respect of certain buildings erected by the defendant for the said Godbold in Chancery-lane.—His Lordship delivered judgment on Saturday last. After reciting the facts of the case at considerable length, the Judge held that there had been no such mistake as alleged, and that the sums paid to the defendant had been paid on the certificates of the architects after they had been duly checked on behalf of the plaintiffs. Judgment for the defendant, with costs.

District Surveyors' Fees—An Explanation Wanted.—At the Mansion House on Wednesday, Messrs. Trollope and Sons, builders, attended before Alderman Lusk, upon an adjourned summons, at the instance of Mr. Collins, the Board of Works district surveyor for the eastern portion of the City, for having, as builders of premises at Nos. 27 and 28, Nicholas-lane, neglected to give notice to him within two days of the commencement of the work, in accordance with the 38th section of the 18th and 19th Vic., c. 22. Messrs. Trollope's explanation was that, thinking the premises in question were in the southern division of the City, they gave the requisite notice and paid the legal fees to Mr. Power, the surveyor of that district, who had inspected the buildings and certified that all was correct. The premises, however, were shown to be in Mr. Collins's district. On Wednesday, Mr. Collins said that since the last hearing Mr Power had paid over to him the whole of the fees, and had handed in the notice given him by Messrs. Trollope, and in these circumstances he asked that that summons might be withdrawn. Sir Andrew Lusk, seeing that on the last occasion he made some strong observations as to Mr. Power's conduct in taking the fees for a matter in another surveyor's district, and in thus causing the summons against Messrs. Trollope to be issued, asked whether he was present to offer any explanation. Mr. Collins said he was not. Mr. Wontner, solicitor for the defence, said Mr. Power was summoned to attend as a witness on the last and on that occasion, but he had thought fit to set the Court at defiance. If such behaviour were tolerated, there would be an end to the transaction of business. Sir Andrew Lusk said if an application were made to him to compel Mr. Power to attend, he should issue that process directly. Mr. Wontner said no doubt Mr. Power's conduct would be brought before the Metropolitan Board of Works, and that would suffice. The summons against Messrs. Trollope was then withdrawn.

A handsome brass eagle lectern has just been placed in St. Mark's Church, Reigate. We understand it is from the workshops of Jones and Willis, London and Birmingham.

WATER SUPPLY AND SANITARY MATTERS.

Norland Waterworks.—The water supply of this village having been contaminated for some time back, a public inquiry was held, and the plans and sections of a scheme submitted by Mr. T. L. Patchett, Halifax, approved. The works, recently completed at a cost of £455, consist of a covered ventilated impounding reservoir, constructed on the edge of the moor, adjacent to the noted "boiling" springs, which have also been covered in and connected to the reservoir. Four inch cast-iron piping is carried across the moor, and along the road to the village as far as the "Blue Ball Inn," a distance of 1,192 lineal yards, and then continued forward, by 3in. piping, to the lower extremity of the district. A loop line of main supply pipes is also carried for a distance of 543 lineal yards round by the church. Public wells are put down at convenient places, as well as branches from the main arranged to the various properties, and provision made for fixing hose and jet.

STAINED GLASS.

Horton in Ribblesdale.—A large three-light stained-glass east window, in the antique, clear, pure, and effective York-minster-glass style, has just been erected in this church to the memory of the late John Wm. Foster, Esq. The subjects are respectively the Nativity, Crucifixion, and Ascension. In the first, an angel bears the legend "Gloria in altissimis Deo." The artists are the Messrs. Powell, Bros., of Leeds.

Haworth, Yorks.—This church has been further engifted with a stained-glass four-light or memorial window, situated at the east end of the south aisle. Of the subjects chosen, each illustrates a prominent event in the lives of the respective chief apostles of the Jews and Gentiles, SS. Peter and Paul. The first two lights represent St. Peter, accompanied by St. John, healing the lame man at the Beautiful Gate of the Temple, to the marvel of the beholders. The groups of the last two lights pourtray St. Paul preaching at Athens. The tracery lights, having special regard to the dedication of the church, present figures of St. Michael and Angels. The whole is richly toned and ornamented. The window is by the art firm of Powell Bros., Leeds.

CHIPS.

The church of St. Michael, New Quay, Cornwall, built a few years since from the designs of Mr. William White, is about to be enlarged from that architect's designs.

The memorial-stone of a new infirmary, now being added to the workhouse of Mile End Old Town, was laid on Tuesday week. Mr. J. M. Knight is the architect, and Messrs. W. and F. Croaker are the builders, their tender at £32,300 having been selected as the lowest of 16 received. The building will accommodate 400 patients.

At the Middlesex quarter sessions on Thursday week, Mr. F. H. Pownall, the surveyor of county bridges, was appointed county surveyor, under the Highways and Locomotives Amendment Act, 1878, at an inclusive salary of £400 per annum.

A memorial stained-glass window has just been placed in the Grammar-school at Monmouth. The subjects are taken from the Beatitudes, and the work has been executed by Messrs. Ward and Hughes, of Frith-street, Soho, London.

A new Congregational Church is about to be built at Elland, near Halifax, from the plans of Mr. Kirk, architect, Huddersfield.

A drinking-fountain is about to be placed on the Hoe, Plymouth, as a memorial. The plans are being prepared by Messrs. Hine and Odgers, of that town.

The Elm Park Estate, Finchley (formerly known as "Elm Place"), is to be sold by auction, in building plots, for the erection of villa and other residences. This freehold estate is one of the finest in the north of London. Messrs. E. E. Croucher and Co., of Chancery-lane and Seven Sisters-road, are the auctioneers.

A new permanent church of St. Paul is being erected in Ferndale-road, Brixton, from the designs of Messrs. Habershon and Fawckner, and will be opened in May next. The organ is being built by Messrs. Lewis and Co., of Shepherd's-bush.

A new meeting-hall is in course of erection in connection with the Established Church at Kingskettle, N.B. The building is Gothic in style, measures 40ft. by 21ft., and is constructed of local freestone. Mr. Storrar, of Cupar, is the architect; Messrs. T. and M. Berwick, of Kettlebridge, have taken the contract for masonry, and Mr. Sellars, of Kingskettle, that for joinery.

Our Office Table.

Thanks alike to our readers and advertisers, we have this week been able to add another eight pages to the Building News, which will henceforth consist of 48 pages of letterpress, and six or more pages of illustrations. The enlargement will remove, for a time at least, the inconvenience we have laboured under for some time, arising from the growing demands upon our space; should it recur, and readers and advertisers once again combine to exert the gentle (and by no means objectionable) pressure we have just yielded to, we shall be quite ready for another enlargement.

A recent advertisement for a surveyor and inspector of nuisances for the Swindon Local Board district, at a salary of £90 per annum, brought nearly eighty applications for the office. Only three of these were from local men, the others residing in the following towns:—Ramsgate, Edinburgh, Sheffield, Manchester, Bognor, Southsea, London (4), Birmingham (2), Taunton, Rochdale, Oxford, Stratford-on-Avon, Burton-on-Trent (2), Southwark, Malton, Horncastle, Hull, Norwich, Camden Town, Derby, Cirencester, Stafford, Bedford, Walthamstow (2), Holbeach, Gateshead, Liverpool, Huddersfield, Croydon, Newnham, Bristol (2), Liddington, Lower Clapton, Hereford, Bolton, Buxton, Lowestoft, Carlisle, Nottingham, Darlington, Bradford (3), Shipley, Glasgow, Whitby, Manchester, Yarmouth, Alton, Leeds, Llandudno (2), Stranraer, Middlesbrough, Tunbridge Wells and Leek. A special meeting to consider these applications was held in the board-room on Tuesday week. Some of the applications raised a laugh. One applicant for this £90 a year remarked that he understood the board would require some security, but "as he was possessed of property worth at least £18,000, it would be clear this could be easily be arranged"! One very handsome builder in the North, in business on his own account, sent his photograph as a recommendation. Another directed his envelope so badly that it passed through, and bore the stamp of, no less than nineteen post offices before it arrived at its proper destination. After an examination lasting upwards of four hours, four gentlemen, from Lowestoft, Walthamstow, Bolton, and Hereford, were selected for a personal interview with the Board.

It is stated that Sir William Harcourt's London Water Bill avoids his predecessor's gross blunder of embodying the terms for purchasing the varied interests of our seven or eight companies. The bargain, if any be attempted, will be left to the new Water Trust or other power now hatching, or perhaps by this time duly hatched, for official incubation has not been neglected, say rather steadily advanced, by Parliamentary obstruction. The Water Trust contemplated by the report of Sir William Harcourt's Committee was designed to have the choice of regulating the supply as in the hands of the companies, to introduce a competing supply, or to buy up existing interests—these alternatives to be exercised separately or in any chosen combination.

The 14th annual general meeting of the Builders' Clerks' Benevolent Institution was held at the offices, 27, Farringdon-street, E.C., on Tuesday, Feb. 22, Mr. Stanley G. Bird (the new president) in the chair. The report showed that the income for the past year was £510 2s. 2d., of which sum £375 1s. 9d. belonged to the Relief Fund, and £155 0s. 5d. to the Orphan Fund. During the year an addition of £300 stock had been made to the invested funds. A public dinner was held on the 6th April last, under the able presidentship of Mr. Taprell Holland, the sum of £269 16s. being the result of his earnest appeal on the occasion. This success enabled the committee to add a new pensioner to the list, and a vacancy occurring at the same time through the resignation of Mrs. King, an election was held, when Mrs. S. A. Coulson, and Mrs. M. A. Olver (the only eligible candidates), were both elected by show of hands, being thus spared the expense and anxiety of a contest. The total number of pensioners now on the funds is 10, besides two children being maintained and educated in connection with the Orphan Fund.

It has been asserted that the First Commissioner of Works is likely to bring in a

Bill to remove the Temple Bar Memorial. The report is we believe unfounded, and probably springs out of the fact, mentioned by us a fortnight since, that next session, when the question of the government of London comes forward in the shape of a Cabinet measure, it is likely that provisions will be introduced which will give the First Commissioner of Works the same power in the streets of the City of London that he has in the streets of the metropolis outside London, by which he can forbid the erection of any memorial or building of any sort in a public thoroughfare, and his acquiescence is necessary to any such erection.

ON Tuesday evening a lecture on "Ideals in Christian Art" was delivered in the hall of the Liverpool Free Library by Mr. C. T. Gatty, F.S.A., curator of the Mayer Museum. Mr. Gatty exhibited, by means of the oxy-hydrogen light, a number of drawings from ancient and modern works of art, carvings, paintings, sculpture, and illuminations included within the Christian era, with a view to demonstrate that up to the fifteenth century there was always an unmistakable air of the supernatural about the productions of artists, and that from that time to the present day the tendency had been to represent the simply human element to the exclusion of the religious ideal. In support of his theory, the illustrations were exhibited in a series of constrasts. As an instance may be mentioned the Great Seal of England in the reign of Edward II., in which the king is represented as the rigid, upright, thoughtful, ideal Christian king, with a dove perched upon the top of his sceptre and a cross upon the globe. On the other hand was the Great Seal in the reign of George IV., without the dove and the cross, the monarch depicted in an attitude of ease, surrounded by luxury and supported by the presence of Hercules and Minerva.

Harper's Magazine for this month has an interesting article by Mr. Moncure D. Conway, on Bedford Park, with some illustrations, comprising —A View from a Balcony—Tower-house and Lawn-tennis Grounds—Dining-room in Tower-house — Queen Anne Gardens — Co-operative Stores and Tabard Inn—Reading and Billiard-room, Club-house—A Fancy-dress Party at the Club—and An Artist's Studio. Mr. Moncure D. Conway says that his "summer ramble ended in a conviction that Bedford Park was an adequate answer to Mr. Mallock's question, 'Is Life Worth Living?'" If lived at Bedford Park, Mr. Moncure D. Conway says, "decidedly yes."
